Most of the exhibits, as already stated, consisted of maps, plans and photographs. These were displayed, as is the ordinary plan, on vertical surfaces. As the walls of the corridors in which the exhibit was held, however, were of stone, it was necessary to arrange for some method of attaching the exhibits. For this purpose screens were prepared, consisting of a framework of two end posts connected by two or more cross-pieces, on which was stretched burlap. The screens thus formed were approximately 8 feet high and 8 feet long. For the larger drawings these proportions served very well. For the smaller ones and for photographs of ordinary size, however, the height was too great. Six feet should be the limit of height for any exhibit of this nature, which it is necessary to inspect closely.

PROPOSED UNION STATION FOR SUBWAYS, PHILADELPHIA

will not be affected by the construction of the parkway, or the new ones which it is proposed to erect. This was located in the Mayor's reception room, and was inspected and in many cases closely examined by thousands of visitors, and by none more attentively than the citizens and taxpayers of Philadelphia. In addition to this the city had also prepared models of the proposed union station for the underground railroads, three lines of which are planned to meet near the northwest corner of the City Hall. There were also models of two local civic centers, these showing branch library buildings, fire and police stations, playgrounds, public bath houses, comfort stations, subway entrances, etc., arranged around a central park.

A larger model than that of the Philadelphia parkway, although in some ways not so elaborate, was one of the city of Toledo and the immediately surrounding country, which was about 20 feet square and showed the streets of the city and the roads leading therefrom, rivers, parkways and other features. This had been sent in several sections, which were re-joined in the exhibition room, and the whole blocked up at an angle of about 30 deg. with the horizontal to facilitate inspection from one side only.

A somewhat different style of model was that shown by Olmsted Brothers representing two methods of developing a hill in a residential district. One of these, Aspinwall Hill, Brookline, Mass., showed the streets arranged with reference to the contour lines so as to produce easy grades; on the other, Wallaston Hill, Quincy, Mass., the streets were laid out on the

In addition to these general classes of exhibits there were a few of different kinds, these included a model of the Heenan refuse destructor, bricks made in England of refuse clinker, a model of a poured concrete house with full-sized samples of a make of forms adapted for such construction, and an underground garbage receiver for private residences.

One interested in only a general way in city planning was impressed if not oppressed by a constantly repeated similarity in the drawings shown, although the expert would, of course, recognize the minor differences in treatment. Possibly the most important similarity was the word "proposed." City after city displayed plans of "proposed improvements," "proposed civic centers," "proposed parkways," etc. Of American cities Boston, Des Moines and Milwaukee seemed to be almost the only exceptions to this. As just stated, Des Moines' proposed civic center is well along toward completion, at least so far as the buildings are concerned. In Boston, while the ideas and ideals of the city planning experts and enthusiasts are not by any means completely realized, there is a more considerable degree of fulfillment of them than in the case of any other city.

It is very suggestive, however, that mingled with these proposed plans for centers of concentrated civic beauty were a number of plans and photographs showing both existing and proposed conditions as to ordinary streets for both business and residence purposes, arrangements for housing and subdivision and treatment of properties which show that the city improvement movement is obtaining momentum along more practical

nes. This, in our opinion, is very fortunate, not only because this class of improvements is fully as important as, if not more than, the opening up of parks and civic centers, but because we believe that the entire movement for city improvement was likely to collapse from the absence of a serious interest in it by the ordinary taxpayer and because of the enormous sums involved in these ambitious projects which necessarily postponed their carrying out into the future.

When a citizen and taxpayer, however, sees that city planners are not entirely in the clouds, but are taking an interest in matters which affect their every-day life, they may not only be glad to adopt their plans for the improvement of their homes and business and every-day comforts, but may be willing to seriously consider even the most ambitious aims for the development of cities along the artistic side.

Among these what may be called utilitarian features of city planning, as illustrated at this exhibit, may be mentioned the proposals for introducing diagonal avenues in Philadelphia. This city has long been the standard example of the rectangular system of street planning and it is significant that its deficiencies have been felt by the citizens to be sufficiently serious to lead to the contemplation of cutting out of built-up blocks ten or fifteen diagonal streets scattered over the entire area of the city. Another suggested plan for the Thirty-fifth Ward of Philadelphia shows a riot of curved roads with hardly an inch of straight line, which appears to us to be altogether too great a reaction from the rectangular.

A number of features were illustrated in the exhibit by several cities which have not ordinarily been connected with city planning, and the presence of which are a further indication of the tendency to consider this from all its practical sides. These include plans of bridges, of water works structures, including not only water towers and pumping stations, but also filters, underground mains and the like. Some cities showed photographs of the improvements effected by removal of street obstructions, by street paving and cleaning up and paving of alleys. Railroad station treatment in New York, Baltimore, Frankfurt (Germany) and other cities was shown by numerous photographs, indicating the desire of these corporations to do all in their power to remove those former conditions which made it generally true that the worst impression obtainable of any city was that given by and in the view from its railroad station.

Photographs of modern houses in Munich, Germany, show that that city has found it practicable to adhere to the old picturesque traditions of architecture and at the same time not to neglect modern ideas of sanitation or even of convenience. It is to be hoped that American cities will similarly retain their local peculiarities of architecture as far as these are artistically commendable and consistent with modern sanitation, and that the familiar styles of colonial New England and Philadelphia, the high-pillared mansions of Virginia and the Spanish architecture of our Southwest, will be retained with a similar pride and appreciation of their value in making attractive cities and contributing "local color" in this country, where history is so new and traditions so few.

There are numberless details of city planning represented in this exhibit, such as plans of proposed and constructed subways, wire conduits, sewers and other underground structures, street railways, lighting standards, etc., features which we hope to see occupying a prominent part in future exhibits.

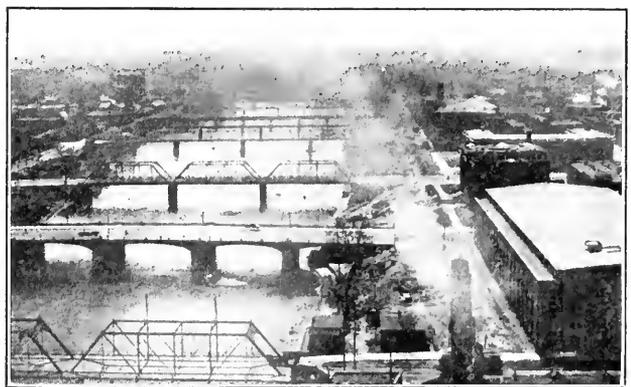

Not the least promising feature of this Philadelphia exhibit is the interest being taken in it by the citizens of that city. The exhibit is open to all from 10 a. m. to 10 p. m., and at no time between these hours during the past week was the exhibit without some visitors, and during the evening hundreds if not thousands inspected it. Moreover, these appeared to be in most cases not merely brought there by idle curiosity, but to have come with an aim to seek and obtain some definite information or general ideas on the subject of city planning.

Possibly no better idea could be given of the widespread attention which is being given to this matter of city planning than to give a list of the cities which sent exhibits to Philadelphia

for this occasion. These include Corey, Ala.; San Francisco, Cal.; Montreal and Toronto, Can.; Denver, Col.; Hartford and New Haven, Conn.; Washington, D. C.; Savannah, Ga.; Chicago, Ill.; Des Moines, Ia.; Baltimore, Md.; Boston, Mass.; Detroit, Mich.; Minneapolis and St. Paul, Minn.; Kansas City and St. Louis, Mo.; Montclair and Jersey City, N. J.; Buffalo, New York and Rochester, N. Y.; Cleveland, Columbus and Toledo, O.; Portland, Ore.; Harrisburg, Philadelphia, Pittsburgh and Wilkes-Barre, Pa.; Newport, R. I.; Columbia, S. C.; Seattle, Wash.; Madison and Milwaukee, Wis.

CONFERENCE ON CITY PLANNING

The Philadelphia conference on city planning was the most successful of the three which have been held in this country. The program was carried out practically as previously arranged, most of the sessions beginning promptly on time. The arrangements made by the city of Philadelphia were excellent and thoroughly appreciated. One indication of the good management which characterized the arrangements throughout was the fact that the extensive exhibit was completed in all details in time for the conference, although it is intended to keep it

DES MOINES RIVER FRONT, LOOKING SOUTH. Auditorium, library and post office on the right bank

LOCUST STREET BRIDGE, CITY LIBRARY AND GOVERNMENT POST OFFICE. The buildings are on the west bank of the river

MUNICIPAL BUILDING OF DES MOINES. At east end of Locust Street bridge. Nearly completed

open for several weeks and the preparation of it involved the obtaining of material from scores of cities throughout the country.

The first session of the conference was devoted to the general topic of real estate policies, one of the principal speakers being Thomas Adams, city planning expert of the Local Government Board of England. The second session was devoted to public buildings and their location; and the third to the relation of public buildings to the street and to the site. Among those discussing the last topic was Mr. Raymond Unwin, of London, England, a well-known writer on town planning. The fourth session discussed the subjects of taxes, assessments and condemnation. At the fifth the harbor improvements of New York and of Philadelphia were described, compared and discussed.

The sixth session was of especial interest to city engineers and was essentially practical in its nature, dealing with street dimensions, surfaces and sub-surfaces. This was in charge of Nelson P. Lewis, chief engineer Board of Estimate and Apportionment of New York City. The papers presented were four, one by Chas. Mulford Robinson, entitled "Narrowing of Minor Residence Streets as Affecting Tenants and Owners"; one by John Nolan, entitled "Standardized Street Widths"; the third entitled "The Street Surface," by Geo. W. Tillson, consulting engineer for the Borough of Brooklyn, N. Y., and the fourth, by Geo. S. Webster, chief engineer of the Department of Surveys of Philadelphia, entitled "The Sub-surface." An abstract of the first mentioned is given elsewhere in this issue.

In discussing street widths Mr. Robinson expressed opinions adverse to the establishing and enforcement of standard street dimensions, while Mr. Nolan advocated such standards. We do not believe, however, that the opinions of the two differed greatly, but rather the papers were written from slightly different points of view. Perhaps the most serious objection to establishing street widths, and especially to adopting the narrow streets recommended by Mr. Robinson, is the possibility that the future character of the street may refuse to develop along the lines planned for it, and that a street made narrow and designed as a minor residence street may become more or less of a thoroughfare. To meet this objection Benjamin Haldeman, assistant engineer in charge of city planning, Philadelphia, recommended the "elastic street," in which provision is made for the width required by a thoroughfare, although only present needs are met by finished roadways and sidewalk paving, the remainder of the width between property lines being given over to parking, tree spaces, shrubbery and the like.

In discussing the street surface Mr. Tillson called attention to the influence upon choice of surface material which should be exercised by the traffic of the street, its width and other features of city planning. There was not total agreement with his expressed opinion that macadam roadways have no place on city streets. He apparently would confine city pavements to those only which are placed upon a concrete foundation, while others thought that macadam may well be used on lightly traveled residence streets.

In discussing the sub-surface, Mr. Webster called attention to the great importance of municipal control over the conduits, pipes and other structures which are hidden from the view and from the knowledge of most citizens, but the proper construction and control of which play a large part in the maintenance of the pavement above, and which are becoming so numerous in the streets of large cities that it is with difficulty that place can be found for new ones. He also emphasized the necessity for the keeping by city officials of an accurate plan of all subsurface structures. We described some months ago Brooklyn's method of keeping such records and hope in a few weeks to describe those employed in Philadelphia.

The topic for the seventh session of the convention was the legal aspect of city planning—the existing laws and those which it seemed practicable to secure which would permit and encourage the adopting and carrying out of city plans. The principal paper on this was by A. W. Crawford, assistant city solicitor

of Philadelphia, discussed by Prof. Freund, of the University of Chicago Law School. The session was presided over by Hon. Walter L. Fisher, the Secretary of the Interior. Concerning excess condemnation—that is, the acquiring by a city of more land than is required for a contemplated improvement—Mr. Crawford said: "It is practically essential that the power of excess condemnation shall sooner or later be upheld, if American cities are to be rebuilt as European cities are being rebuilt. We would refer to constitutional changes proposed in Massachusetts and New York expressly authorizing such acts of excess condemnation. Whether this is an advisable method is at least questionable. While the constitutional change may be effective in the States concerned, they will not avoid a difficulty possibly presented by the Constitution of the United States.

"The Constitution of the State providing for excess condemnation will have to be upheld as not unconstitutional under the Constitution of the United States. For my own part I am inclined to think it more likely that a decision by a State Court upholding excess condemnation within reasonable limits would in turn be upheld by the Supreme Court of the United States. Up to the present time there has been no case before the Supreme Court of the nation in which a decision of a State Court holding that a condemnation is for a public use has been reversed. If, instead of a decision of a court of competent jurisdiction, a constitutional declaration passed by the people at the polls is presented to the Supreme Court of the United States I fear an entirely different attitude will be found upon the part of that distinguished tribunal."

The power to restrict high buildings to fixed zones had already been upheld in Boston and probably would be elsewhere. The power to generally prescribe the nature of development which must take place in each zone of a city, however, he did not think was to be recommended, as he did not believe that any authorities were competent to justly decide for future generations where must be located the business, the manufacturing and the residence districts; especially in view of the rapid growth of each of these in most of our cities.

In discussing excess condemnation Professor Freund believed that this should apply only to "remnants"; that is, unutilized sections of the city blocks or of estates or properties only portions of which are required for municipal developments such as streets, parkways, etc., these unrequired remnants being then sold or leased under restriction. He did not believe that properties should be acquired by the city simply because they were adjacent to improvements, in order that the city might reap the profits of appreciating value, partly because of the distrust of taxpayers that this right would be exercised wisely and honestly by the officials. A wiser plan for attaining the same end would be to assess the cost, or a large part of the same, against the property whose value would so appreciate because of the benefits rendered by the improvements.

Reference was made at this session to a law recently adopted in Germany, which law was described at the eighth and closing session by the German Ambassador, Count von Bernstorff. In the expansion of Frankfort it was found desirable to acquire considerable private property for streets, parks, etc., and in doing this a large number of small holdings of land were taken, comprising practically all of the district affected, the streets and other improvements plotted out, and the land not required for this purpose was then redistributed to the original owners, each in proportion to the size of his original holding. This was at first with the consent of the owners, but a law has now been passed giving the city the right to force a redistribution in this way. During the past ten years Frankfort had spent more than fifty million dollars in the purchase of land.

At this session Senator F. G. Newlands, of Nevada, advocated the establishing of a department of city planning by the general government; a proposition which had received the approval of the conference by formal vote in the afternoon session.

The City Planning Conference

Probably no one who was present at the Philadelphia Conference on City Planning last week would disagree with the statement that this was the most successful of the three conferences so far held. Much credit is due to the committee which, in lieu of a more formal organization, has been keeping up the interest in these meetings and arranging for the annual conventions. The City of Philadelphia, and especially Mayor Reyburn, also are entitled to a large share of the credit.

City planning is or should be the foundation for practically all of the development of the city on its material side, and we therefore offer no apologies for the considerable amount of space given this week to a discussion of this subject. Unfortunately, sufficient attention has not been given to this fundamental feature in most cities, with the result which ordinarily follows from carelessly built foundations, that trouble ensues later on.

There is, of course, acceptable excuse for this, if not excellent reason, in that most cities have grown almost imperceptibly from villages, and that for the latter a formal plan seems almost conceitedly elaborate. But experience has taught the desirability of preparing city plans as soon as the tendencies of growth can be anticipated with a fair degree of accuracy.

City officials, however, who have to do with city streets or any of the structures which are located either above or below their surfaces, realize how much simpler would be their present duties and how much more satisfactory the possible results if these streets had been planned in the first place with carefully thought out ideas as to just what their functions would be and how these best could be provided for.

In no city, however, is it too late to seriously study the problems presented and plan comprehensively for the extensions of its street system, at the same time giving even more serious consideration to the more difficult problem of adapting existing conditions to present and future requirements at the least cost and with the least interference with private rights in the streets and properties affected.

We hope that city planning will in the future receive much more attention from city engineers and other municipal officials having charge of street paving and the designing and construction of sewers, water distribution systems, wire conduits and similar structures, as well as by park departments and others engaged in cultivating the artistic features of the city.

Cost Keeping for Contractors

A recent issue of the *Journal of the American Society of Engineering Contractors* contains an article entitled "Cost Keeping and Its Value in Relation to Estimating on New Work," which is significant in its substance as well as in its title in that it indicates that the contractor of to-day is looking upon his business as not merely that of a good "boss," getting a maximum amount of work out of each laborer at the minimum wage, but that he is advancing it to be a profession, the laws of which should be studied and mastered if success is to be attained.

Even more significant of this than the paper itself was the discussion, in which several contractors stated their belief in this idea of contracting. One contractor whose work is largely reinforced concrete stated: "I keep a clerk on all of my work, and he has nothing to do but one thing, keep the time and keep track of the materials and their disposition. He checks up materials, and that relieves the foreman of that duty. . . . It is a small job that does not pay for the clerk to keep time and check materials. I think that is as necessary as any other part of the work. If there is a bag of cement that goes over to a certain footing it is charged to that footing, and so on for other sections of the work. And all it costs to know that is the salary of the man who is taking notes of them."

Another speaker summed up the advantages to contractors of cost keeping as follows: "The old-fashioned contractor who did not keep cost records never knew whether he had made or lost money on his job until it was completed; and if he had made money he did not know on what items he had made it. He had made money on the whole job, and that is all he knew. And he used those same figures on the next job, if it was similar to the previous one; whereas, if he had kept a cost system he would have been able to bid more intelligently on work by reducing the price on some of the items where he had made more than was necessary, and increasing the price for those items on which he had figured too low before."

The author of the article, Berton M. Laughhead, described in brief what is included in such cost keeping, as follows: "In order to successfully make estimates that will enable a contractor to make safe bids, it is absolutely necessary that he keep daily records, in detail, of every branch of his work, so that on completion, he will be able from such records to compile a final cost sheet that will show him the total cost and the cost per yard of his work."

ASPHALT PAVEMENT CONSTRUCTION

By S. R. MURRAY, Asphalt Superintendent, Denver, Colo.

A GREAT deal has been written and said on the subject of asphalt paving, but as most of it has been written by parties who were interested in exploiting some particular kind or brand of asphalt a few words on the subject by one who has only the best interests of the entire asphalt paving industry at heart may be of interest.

The laying of asphalt pavements was kept as a secret by the paving companies for a great many years in order to eliminate competition, but at the present time full information can be secured from any of the many asphalt experts in the country.

A first class asphalt or bituminous pavement can be constructed from any first class asphalt. The Trinidad asphalt, both lake and land, was the most widely used asphalt until the last decade. It is one of the best known natural asphalts, and comes from Pitch Lake, on the island of Trinidad, on the eastern coast of South America. The two kinds of Trinidad asphalt, lake and land, are similar in character, with the exception that the land asphalt has overflowed from the lake at some early time and has been exposed to the action of the sun and elements, which have rendered it harder and more brittle than that remaining in the lake. The asphalt in the center of the lake is soft, while that around the edges is comparatively hard, especially in the early morning, at which time it can be dug out with picks and loaded on vessels in bulk (usually as ballast). A great quantity is shipped to the United States, where it is refined. In its natural state it only contains about 35 per cent of pure bitumen, which is the only ingredient in asphalt cement which is of any value in a pavement.

After refining the purity is increased to about 57 per cent. The asphalt thus obtained is shipped in barrels to the point where it is to be used, where by the addition of a proper flux, usually a heavy oil residuum, it is converted into asphalt cement of the consistency desired. Its purity has been increased by the addition of this flux to probably 66 or 67 per cent pure bitumen.

The Cuban asphalt also is a natural asphalt, as are the Bermudez, Venezuelan and Gilsonite. The Cuban asphalt has a great many of the qualities of Trinidad asphalt, and has about the same degree of purity. One peculiarity about this asphalt, however, is that it does not readily assimilate with a flux of a paraffine nature, but readily mixes with oils of asphaltic base. The Bermudez is the purest of the Pitch Lake asphalts, and comes from the province of Bermudez, in Venezuela. After refining and fluxing it runs in the neighborhood of 95 per cent pure bitumen, and many good pavements have been laid with this material. Gilsonite, from Utah, is the purest of all natural asphalts, being almost entirely pure bitumen. The bitumen is in a very hard form, resembling anthracite coal, and therefore this asphalt requires a great deal more flux to render it of a suitable consistency for paving purposes than any of the other asphalts. Great care should be taken in the flux used with Gilsonite if intended for paving purposes, as on account of the hardness of Gilsonite it sometimes requires as much as 100 per cent of flux, depending on the kind used, to make it of the proper consistency, whereas with Trinidad about 25 per cent of flux would be sufficient, and in the case of Bermudez 15 to 18 per cent is usually sufficient to make asphalt cement.

Manufactured asphalt or residual pitches are obtained from the California and Texas oils, and the oil found in Kentucky is also rich in asphaltic bitumen. The Kansas oil is a semi-asphaltic oil, the base being partly asphalt and partly paraffine.

The Indiana, Ohio and Pennsylvania oils are nearly all paraffine base and therefore the residue is paraffine, instead of asphalt, as in the California, Texas and Kentucky asphalts. In the manufacture of oil asphalts the stills must be kept at a temperature not any higher than is absolutely necessary to drive off the volatile oils, and the distillation can be stopped at any point to secure the consistency desired.

On our work in the city of Denver we have combined the

Texas asphalt, which is not readily affected by changes of temperature, with the California asphalt, which possesses very high ductility, thereby securing a first class asphalt cement which has great adhesive qualities and is not liable to become brittle in cold weather.

A mistake which has been made in a great many cities is in not getting the proper gradation of the mineral aggregate entering into the asphalt mixture. Grading of the sand is of the utmost importance if stability is to be secured in the pavement, for with the voids filled a softer asphalt cement can be used in the pavement and still not shove up in waves.

In the past there have been as many as 15 to 25 per cent of voids in asphalt paving mixtures, and in this case if a soft asphalt cement was used in order not to crack at low temperature the pavement would shift around under traffic during the warm weather. In some instances as many as three different kinds of sand have been mixed together to secure the results desired, while in other localities, for instance, in Sandusky, O., sand can be secured where one grade is all that is necessary to form what is known as a well balanced mixture. The sand need not necessarily be of the sharpest grade, but on the other hand, sand found in the sand dunes along the Great Lakes, which has been blown around by the wind for ages until the grains become rounded and nearly all of the same size, would not make a good paving mixture.

The sand gradings are varied somewhat by the conditions of traffic on which the paving mixture is to be used. A good sand grading for ordinary traffic would be about as follows: all of the said to be passed through a screen 8 meshes to the lineal inch:

8	per cent to be retained on a	20	mesh screen
18	" " " " " " "	40	" "
17	" " " " " " "	60	" "
19	" " " " " " "	80	" "
18	" " " " " " "	100	" "
20	" " " " " " "	pass through the	100 " "

This would form a well balanced mixture with the addition of a proper amount of filler, usually from 5 per cent to 13 per cent, according to the degree of fineness of the sand and the kind of asphalt cement used. Trinidad asphalt contains a good deal of fine volcanic dust and does not require as much filler as Bermudez or manufactured asphalts, which run very high in bitumen. In good practice 10 per cent to 11½ per cent of bitumen is all that is needed in an asphalt mixture, the larger quantity being used on streets that carry very heavy traffic, and a good deal of fine material and filler being added in order to carry the extra amount of bitumen.

Bituminous macadam pavements have been laid in a great many cities, usually with good results where traffic is not too great. In the pavements of this character laid on Speer Boulevard by this city asphalt cement was used as a cementing material in one block and coal tar bitumen as a cementing material in about two blocks, Portland cement being used as filler in each instance on account of the inability to secure limestone dust. Care was taken that the mineral aggregate should contain as few voids as possible, and the pavement after being laid was squeegeed with Texas asphalt on account of its not being so susceptible to changes of temperature. Lincoln street of this city was also laid with asphalt macadam by contractor two years ago, and all of these various pavements are giving good results.

The main difference between these pavements and the shell asphalt pavements is that the material usually used is crushed hard limestone, granite or basalt ranging in size from one inch down to an impalpable powder, graded in order to reduce the percentage of voids, whereas in asphalt pavements the material is all smaller than 8 mesh. These pavements have only been used for ten years, and therefore cannot be justly compared with asphalt pavements, which have been in use for more than twenty-five years, but on account of their lower cost they have been very popular pavements where tried.

Municipal asphalt plants have been established by a great many cities in the United States, among them being Brooklyn, Detroit, Columbus, Dayton, New Orleans, Indianapolis, Bluffton, Denver, Spokane, San Francisco, Kansas City and Cincinnati, and in every instance they have proved good investments for the city and have paid for their installation in about two seasons, besides enabling all pavement repairs to be made at a lower cost, at the time desired, and of the very best materials.

Winnipeg and Hamilton, Ont., not only do their repairs, but do all the new work from their own plants, saving thousands of dollars to the property owners annually, and I believe it is only a question of time until the American cities follow the example of their Canadian sisters.

A municipal plant is even a good thing for the paving contractor, as it enables the city to keep its pavements in first class condition at all times, and in my opinion the very best advertisement for asphalt and sheet pavements of any kind are "good" sheet pavements.

NARROWING MINOR RESIDENCE STREETS

Its Effect on Tenants and Property Owners—Too Wide Streets Require Crowded Buildings—Building Restriction

Abstract of paper by Chas. Mulford Robinson before Street Planning Convention.

THE phrase "minor residence streets," as used in the title of this paper, is intended to exclude all main highways, all avenues and boulevards, and all streets which carry a through travel that so much as even equals the traffic originating and terminating within the street itself; consequently all streets that carry car lines or that are routes convenient for general teaming, driving and motoring. Minor residence streets include those which are relatively uninviting to traffic, either because of the special development of other thoroughfares, or because of some physical handicap of their own, such as indirection, heavy grades or a break in continuity. They receive the little eddies from the traffic streams which flow through main thoroughfares, and will therefore be generally in close connection with major streets and traffic highways. In an ideal city plan, in which arterial streets radiate from a common business center, the minor streets are located between the radii. They will not be limited to any one residential section of the city. They do not exclusively belong to any one class of citizens. Necessarily, therefore, they vary in character. The back-lined alley off a third-class business street, and a private "Place" off a fashionable avenue will alike be considered here as a "minor residence street." They are more numerous and on them dwell more citizens than any other single class of streets.

Their economic influence, for good or ill, is not their only influence. Between two minor residence streets, or between two well-defined divisions of one of them, there may be the diameter of the whole social structure. If, then, even the width of these streets be standardized, so that they all tend to uniformity, and the lives of the residents are not, and cannot be, reduced to a fixed social mean, there must inevitably result a series of misfits, of which the outcome can be only prodigality, social inconvenience and a general maladjustment to real conditions. There are other ways in which standardization means extravagance and maladjustment; but I shall speak of only the one matter of width.

Wide streets increase the rents of houses. Alderman M. W. Thompson, chairman of the National Housing Reform Council of England, in his valuable compilation, "Housing Up to Date," states that under modern conditions of subdivision the cost of roads, sewers, etc., reaches in some cases as high as \$45 per room, or \$225 per cottage, and that it averages \$45 per cottage. This calculation is based on statistics covering thousands of cottage dwellings, and since the word "cottage" means in this connection houses built in continuous rows—that is, dwellings that occupy with their grounds a minimum street frontage—it reveals the effect on rents for even the cheapest

homes. As to the more costly villa type of dwellings, the same authority notes that the English by-law requiring a paved or macadamized road surface of about 40 feet, has made the cost of thoroughfares, in newly developed estates on the outskirts of towns, from \$1000 to \$2500 per acre—"or more than the land itself."

John S. Nettleford, in his "Slum Reform and Town Planning," calculates that the interest on the expenditure for street work "comes to one shilling or more per week on a house rented for six shillings, if the number of houses is restricted to fifteen per acre." One must hear that statement twice to get its full significance, and must realize that the suggested restriction is not a low one. At Bournville the houses are restricted to eleven to the acre, and at Hampstead Garden Suburb to only eight. Yet at fifteen to the acre, one sixth or more is added to the weekly rent by the English by-law requirement of forty-foot streets.

Raymond Unwin puts the unreasonableness of the requirement in this striking way: "A mansion such as Chatsworth or Blenheim will be adequately served by a simple carriage drive from 13 to 20 feet wide. The population of such a building will be larger than that of a row or group of cottages, and the amount of wheel traffic to and from it many times as great; yet for the cottage road asphalt or concrete paved footpaths, granite curbs and channels, and granite macadamized surface, the whole from 40 to 50 feet wide, and costing, with the sewers, etc., from £5 to £8 (\$25 to \$40) a lineal yard, are required by the local authority under our existing by-laws."

The burden of all this cost, to which is to be further added the value of the land thus withdrawn from productive use, is borne by the occupants of the district, whether they be tenants or owners. The cost is therefore an important factor in the living expenses of all citizens, and if our present method of standardization is unduly extravagant it should not be permitted to persist simply through inertia and because it saves trouble in surveying and thinking.

The new town planning act in England recognizes the condition by permitting English local authorities, in order "to secure proper sanitary conditions, amenity and convenience," to relax or modify former requirements, breaking away from the tradition that all streets should be of like width and like strength. Furthermore, the act itself recognizes three distinct grades of roads—main arterial, secondary and residential.

Dr. Hegemann, of Berlin, has traced the relation of cause and effect between the wide streets which the Germans built a few years ago and the tenements with which those streets are lined in the more remote portions of the German capital; while Thomas Adams, of the town planning department of the Local Government, of England, said that after investigating conditions in Germany and Sweden, he had come to the conclusion that the system of high tenement block dwellings was as much the result of wide roads, as wide roads had become the result of the tenement system. The one, he said, was complementary to the other. It was necessary that the owner extract from each yard of his frontage enough rent to pay its share of the costly street.

That in England and America broad streets, in areas where the poor are congregated, are not—save in New York—as commonly lined with tall tenement barracks as in Germany, does not mean that the same economic law is not in operation, or that it operates less unfortunately. A social repugnance to the big tenement, except as a last necessity, has led to the construction of small houses (often more crowded per room, and less sanitary, than is the tenement block) and then, to squeeze from the land the higher rent necessitated by the cost of frontage on an expensive street, has induced the construction of another house, sometimes a small tenement, on the rear of the lot. These houses hidden by the structures in front are uncontrolled by ordinary police inspection and unaffected by public observation and criticism. They become such breeding places of disease and vice that at last, in city after city, it becomes necessary to forbid their erection.

Of great significance also is the fact that there could be

cheaper minor streets for residence purposes, less capital would be required in the development of estates, less land tied up for want of the capital, and more land thrown open for building.

If the narrowing of minor residence streets tends to reduce rents, it does not follow that it tends to reduce property values. The latter are for the most part—as regards property of this character—the capitalization of net income, expected if not realized. A reduction in rents, which results from reduction in carrying charges, may leave net income unaffected.

But this does not mean that a method of street designing adjusted to street needs would not have any influence upon property values. Real estate would feel its influence in various ways.

In the first place it would tend to create stability in values. This effect would be seen alike on the main thoroughfares and on the minor streets. The concentration of through travel upon certain streets would raise the value of the frontage on those streets for commercial purposes; while the assurance that intermediate streets would not be encroached upon for business purposes would not only settle definitely the business character of the chosen main highways, but would have a beneficial effect upon property on the intermediate streets. The reason for this is the certainty which would then be gained that they would be free from the danger of invasion by elements inconsistent and out of harmony with their present use. The more certain, it has been well said, a man can feel that the character of any given street is fixed, the more he is willing to pay for the privilege of having a lot on that street, if it is the kind of a street he wants. He justifies this willingness from an economic standpoint by the argument that the property for the use for which he desires it will not decline in value.

Another effect of a more rational method of street planning would be, as already suggested, the opening of additional tracts for building purposes. This means that fewer persons owning property on the outskirts of cities need be "land poor." There would follow a greater equalization of values between adjoining properties.

Over against the possible depressing effect upon values, which would be anticipated from a greater supply of available building lots, is to be put the increase in demand, which may be expected to follow an enhancement in the attractiveness of small streets. It must be clear that streets which follow more nearly the topography, which makes use of every natural advantage, which are narrow, grass bordered, quiet ways rather than broad and dusty highways that are hot in summer and cold in winter, would call men from the city streets with an even greater appeal than suburban tracts now call.

Though a good deal has been said about the cost of *making* needlessly wide streets, a factor of scarcely less weight is the cost of *maintaining* such thoroughfares once they are built. The saving would represent not only the economy of having to provide for the depreciation of a smaller area of street, but it would be the result of a much less rapid rate of deterioration, because there would be nothing but local travel to wear out the street; so that a cheaper grade of pavement, costing less in the first place, would last as long as an expensive one; for these minor residential streets, inviting no through travel, would be as private entrance ways to the few houses gathered upon them.

It may be said that those who own property on the main traffic highways would be pretty hard hit by construction and maintenance charges, if all through travel were concentrated upon their streets. This is true, but there are three answers to the objection: In the first place, their property would at once gain speculative value. It would have the commercial possibilities which are to be denied to the intermediate streets, and which pay such high returns. In the second place, it would be but fair, wherever it is demanded that wide streets be put through a residential estate for the convenience of communication between districts lying on either side of it, to require that the general body of tax payers should pay the cost of street works in excess of what might

reasonably be held to make for the convenience of the frontage and for the increase of its speculative value. Third, it is probable that, taking the city or even the neighborhood as a whole, the deterioration of pavement would be much less than under the present system. There would be a smaller street area to take care of, and some pavements, such as asphalt, deteriorate less rapidly if they carry a fairly heavy and constant stream of travel. At any rate, by concentrating the bulk of the traffic on a relatively small number of selected streets, these could be especially prepared for it, and given a width and style of pavement calculated to handle the business with the least delay and the smallest cost for operation and maintenance. Then each purely local street could be developed in the way that would best suit the needs, the means and the taste of the people it is designed to serve.

A final consideration with reference to real estate values is, that only such a system of street designing as here proposed can make just and reasonable—and that is to say, can make possible—a radical restriction of the number of houses which may be constructed to the acre. If the city is going to say to the owner of a certain tract that he can construct not more than fifteen houses to the acre, it must also say to him that he will not have to pay, for the development and maintenance of the streets in his tract, any such sum that thirty houses to the acre would be necessary to give him an adequate return on the investment. The one act is really complementary to the other. When a city restricts the number of dwellings per acre in any given area, it places an approximate limit on the amount of traffic for which provision need be made by the local streets of that area. The necessity no longer exists to require that there be adherence to rigid specifications designed to take care of a traffic which may increase with unchecked rapidity. It becomes possible at last to adjust the streets' development to the property's development. But when no limit is set to the latter, as in unrestricted areas, the standard for the street work must be set by the promoter's dreams. It will be correspondingly high, and correspondingly forgetful of the common good.

BEAUTIFYING MUNICIPAL PROPERTY

THE illustration accompanying this article shows a most practical application of principles of city beautifying. Too many city yards are blots upon the landscape and depreciate the value of adjacent property, but we here find the stable and entrance to the yard presenting a most attractive appearance. It is unfortunate that the majority of cities do not set a better example to their citizens by paying some attention to the neatness and attractiveness of their own properties. Springfield, Mass., the owner of the city yard here illustrated, as well as of another, is certainly to be commended for the example which it sets. Incidentally, the city also owns three gravel banks and a trap-rock quarry, a trestle and bins for receiving and storing trap rock, together with buildings for housing the steam roller, wagons and other appliances owned by the street and sewer department.

CORNER OF CITY YARD, SPRINGFIELD, MASS.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Business Men Make Roads

Council Grove, Kan.—The Good Roads Committee, comprised of the business men of this city, turned out in a solid mass 200 strong, with pick, shovel and teams and cut down and graded a large hill south of town which has long been a hindrance to travel to one of the best farming sections of Council Grove's territory. The test was a very successful one and they hope by spending several such days of the summer in this manner this city will have some of the best roads in the State.

Will Charge Oil to the Property

Superior, Wis.—The Board of Public Works is now working on the matter of assessing the cost of oil to be used on the streets against the property fronting on the streets treated in this manner. In accordance with the sprinkling law which Mayor Crumpton succeeded in having the Legislature pass the cost of the oil as well as the labor expense, etc., can be charged to the property benefited. Secretary Beglinger has conferred with Mayor Crumpton in regard to making the assessments and a system is now being worked out by the clerical force in the Board of Public Works. Winter, Twelfth, Bay and Third streets will be the first to be treated with oil. The new sprinkling law covers the street car sprinkling as well as the oil feature, compelling the company to bear its share of expense.

Important Street Improvements Nearing Completion

Charleston, S. C.—Both the boulevard work and the sewerage extension, one representing the reclamation of over 40 acres of land from the Ashley River, at a cost of about \$250,000, and the other standing for an investment of \$400,000 in street sewers and connections, will be completed practically in a few days. After the boulevard filling is done then the City Engineer will proceed to lay out streets on it, and lots will be divided off and sold. Considerable work remains to be done in the sewer contract restoring paving, and making house connections, but the big part of each undertaking is nearing completion.

City Relieved of Paving Burden

Los Angeles, Cal.—By a slight omission in the amended State law passed by the last Legislature to cover the proceedings for the paving of streets, the city is relieved of the responsibility of repaving certain streets where traffic is heaviest. The new law was signed by the Governor a week ago and it has just been discovered that the slight change will have a far-reaching effect in Los Angeles. Many years ago the City Council passed a series of ordinances formally "accepting" the pavement on the following streets:

- Main from Alameda to Thirty-seventh.
- Spring from Temple to Ninth.
- First from Main to Sixth.
- Broadway from First to Sixth.
- Sixth from Broadway to Figueroa.
- Seventh from Main to San Pedro.

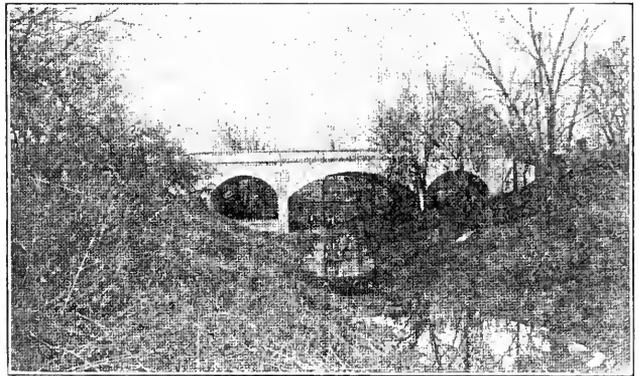

Under the old State law the city was authorized to include in these ordinances a declaration that inasmuch as these streets bore an extraordinary amount of general traffic the city would undertake to renew the pavements from time to time as it became necessary, paying the cost out of the general tax funds. The original cost had been borne by the property owners. Except for these favored streets, the rule was that the expense of repaving a street should be borne by the property owners on either side. Under the new law this favored exception is ignored and in future should any of these streets have to be repaved the property owners will be assessed for the improvement.

Misunderstanding Will Prevent Oiling of Streets

Bridgeport, Conn.—Because of the failure of the Board of Apportionment to specifically appropriate funds for street oiling, instead of providing a lump sum for sprinkling the streets with both oil and water, City Attorney Cullinan has given an opinion to Public Works Director Kenny that the Burns Company is within its rights in going ahead and sprinkling all of the streets with water. There will, consequently, be no street oiling done this year by the Public Works Department.

Concrete Viaduct for Boulevard Crossing Park

Oklahoma, Okla.—A new concrete viaduct has been erected on the Grand Boulevard encircling Oklahoma City. It is one of a number to be constructed along specially-prepared plans for this work; they are reinforced to with-

CONCRETE BRIDGE IN OKLAHOMA PARK

stand a great weight. With the completion of these viaducts more than four-fifths of the new boulevard will be opened to travel. The method of concrete construction employed has enabled the park board to effect a saving of 20 per cent in this work over estimates of the same class of work in the city in the past. The structure illustrated is 30 ft. wide, the central span 40 ft. long and the other two spans 20 ft. long. A park driveway will pass underneath this viaduct.

City Has Fine Boulevard System

Des Moines, Ia.—"Des Moines can profit from Kansas City, which has the finest boulevard system in America," declared Mayor Hanna on his return from Kansas City, where he delivered two addresses on the commission form of government. One address was delivered at the fifty-fifth annual banquet of the Real Estate Board of Kansas City. It was attended by 500 people. "The boulevard system in Kansas City," said Mayor Hanna, "is not costing the city a cent. The property owners are paying for it. They appear before the City Council and ask permission to convert the streets into boulevards. There is always a scramble for permits. After they receive permission they go ahead with the work and pay for it. They receive the benefits by having the value of their property doubled."

Dust-Laying Commences in Earnest

Taunton, Mass.—The municipal dust-laying machinery, after exasperating delays, has started. On the trolley lines this is to be, as in the past three years, by the tramway sprinkler. On the other streets, residential and business, where the houses are closely situated, it is by an application of oil. Some of the latter may not get their treatment for a day or two, but the Highway Department has made its start. The expenses for oiling and watering are so arranged that the cost will be assessed on the owners of abutting property and not from general taxation.

SEWERAGE AND SANITATION

Drinking Cup Outlawed

Chicago, Ill.—Chicago physicians are united in praising the action of the Council in outlawing the common drinking cup. Under the terms of the ordinance, public drinking cups must disappear by August 8. All cups and glasses found in schools, office buildings, department stores, physicians' reception rooms and all public places will be seized.

Health Board Plans Improved Sanitary Conditions

South Bend, Ind.—At a recent meeting of the City Board of Health several matters were taken up. The Board has issued instructions to the sanitary officers of the Police Department to see that all yards are cleaned and out-buildings placed in first-class condition. Those who failed to heed the warning issued some weeks ago will have the work done by the city at their expense.

Water Cups to Go

Plainfield, N. J.—The use of the common drinking cup in public places in Plainfield will be a thing of the past after July 4, according to the provisions of the new law enacted by the Legislature, and persons violating the act will be liable to a fine of \$25 for each offense. There are a number of places in this city where the law will be effective, such as railroad stations, stores, shops, factories, etc. After July 4 paper cups in slot machines, or some other approved method will have to be adopted, not only here, but all over the State.

Explosion of Sewer Gas Does Serious Damage

Akron, O.—It is estimated that it will cost the city \$50,000 to repair the damage done on Howard street by the explosion of sewer gas on that street one day last week. The explosion was in the main trunk sewer, one of the largest sewers in the city, through which practically all of the sewage of the city passes down into the Little Cuyahoga River. This sewer is fully five feet in diameter and was built many years ago of brick. The sewer is so large that it is possible for a man to walk through it. Upon examination it has been found that the sewer has been wrecked in many places, and it was thought that it will be necessary to tear up all of the sewer from the river bridge, at the foot of North Hill, on up to the railroad bridges, and possibly up to a point near Market street. The explosion was more terrific than first reported. Not only is this main trunk sewer wrecked but it is feared that great damage has been done to a large part of the sewage system in that section of the city. The damage done to the bridge over the Little Cuyahoga River will require an expenditure of a large sum of money.

River Residents Must Build Sewers

Toledo, O.—Plans for diverting the sewage of upriver residences and institutions from the Maumee River between Delaware Creek and the Children's Home, for the protection of the water supply at the filtration plant, were thrown into the air by the defeat of the Geleerd bill in the House of Representatives last week. This bill was intended to give the County Commissioners authority to build public sewers by districts outside of the city limits, the cost to be borne by the property benefited. The only way such a sewer can now be built is by assessing the cost on the entire county. West Toledo residents, for whose benefit the bill originally was drawn, similarly will have their plans knocked out. The village is incorporated and the citizens wanted it erected into a sewer district, so that the County Commissioners could build the sewers and assess the cost on the property benefited. "I simply will have to insist that the upriver residents proceed at once with the elimination of the sewage from the river," said Service Director Cowell. "The original order was that this must be done by March 1. It is up to the residents affected to find some way around the difficulty. I waited for the passage of this bill because I thought it was the best way to solve the problem. I am sorry for them, but I am looking after the purity of the city water, and the interests of 180,000 persons must supersede those of 200." W. H. Gould, engineer, employed by the upriver residents, said that he has no idea how they can comply with the order, although his employers are willing to do so.

WATER SUPPLY

Filtered Water by November 1

Evansville, Ind.—Clear water by November 1. That's what the Water Works Board is promising the people of Evansville. A report to the water works trustees assures that Evansville would have clear water in six months. The monthly payment to the Norwood Engineering Company was made, amounting to \$8,762. With the extras to date the plant will represent a value of \$246,292.68. The sum of \$138,633.74 has been paid on the plant and \$147,395.74 remains to be paid. The money is to be paid in monthly instalments until 65 per cent of the total has been paid. Fifteen per cent is to be paid after a test of the plant. Ten per cent, amounting to \$24,600, will be paid a year from the completion of the plant. The remaining 10 per cent is to be paid two years after the completion of the plant.

Will Protect Water Supply

Cortland, N. Y.—The Board of Water Commissioners is taking steps to fully protect the source of Cortland's water supply. The Commissioners have secured options on Dr. Santee's farm of 45 acres and on 20 acres of the Yager & Halstead farm. They will now go before the State Board of Water Commissioners to obtain the privilege of purchasing this land, which will give the city control of practically the entire immediate watershed. The city recently purchased the water works from a private corporation and is improving the system in many ways. All the water used by the municipality comes from a series of springs west of the city, and almost within the city limits.

Citizens Repair Big Dam

McAlester, Okla.—Last year the city of Krebs, with 3,000 population, adjoining McAlester on the east, put in a system of water works at a cost of \$80,000. This included an immense dam. No rain fell following its construction and the winds injured the inner side, so it was feared the rains when they did begin would wash it. Councilman Tony Rich and Councilman-elect T. P. Carano, both former miners, thought while the mines were idle, the miners would help repair the dam. Mayor Seamons proclaimed a holiday and appealed to every citizen to donate a day's work in helping to riprap the dam. On the day set last week over 200 men appeared there and worked all day. The citizens who did not work contributed the money to buy a fine dinner, and at night the work was completed. The old adage of "many hands make light work" was verified, for these 200 men, with 15 teams and wagons, had laid a riprap wall 700 feet long and from 20 to 25 feet thick, averaging 28 feet high. The stone was found in abundance on the watershed and measurements showed that over 600 perch of stone was handled that day. Thus the people of an enterprising little city solved the problem for which they had no money in the treasury to pay to have the work done.

Make City Departments Pay for Their Water

Atlanta, Ga.—The suggestion was made at the Water Board meeting recently that the various city departments now using free water be made to pay for it. This may sound like a joke, but the Water Board didn't consider it so. They've actually got the notion in their heads, and are very serious about it. Complaint because some of the departments are wasting water brought up the suggestion to make them pay. Hereafter a record will be kept on all the departments and they will be ordered to be more careful. Some years ago when water was being wasted the department had meters installed and now they will be made to serve the same purpose again.

Paterson Pays for Water Survey

Paterson, N. J.—The Board of Finance adopted a resolution directing the drawing of a warrant for the payment of the sum of \$1,000 to the State Treasurer for the use of the Water Supply Commission, this being Paterson's share of the cost of the making of the necessary preliminary surveys and borings by the State Board for the purpose of preparing plans for the developing of the Wanaque watershed for the use of this city and other municipalities which have joined in a request for a municipal supply from this source.

LIGHTING AND POWER

Growth of Business Forces City Light Plant to Expand

Pasadena, Cal.—General Manager Koiner has called the attention of the Council to a condition of affairs existing at the municipal light plant, which must have been apparent to any one familiar with the rapid growth of the city's business. This condition is the unpreparedness of the city plant to cope with an excess load. During the winter the plant played almost to capacity business, having left practically no reserve for extra heavy loads, and new and growing business. The steam boilers already installed at the plant are capable of generating much more steam than is needed, but the plant has neither the engine capacity nor the generating unit necessary to use this steam, and now Manager Koiner asks the Council to arrange for this permanent improvement, which cannot be installed in less than six months, and will be needed as soon as installed.

Commission Will Redistribute Arc Lights

Birmingham, Ala.—That the electric arc lighting of Birmingham was not in good apportionment was the declaration of Arc Light Inspector Higgins to Commissioner Weatherly recently, and upon his statement the policy of redistributing the arc lights of Birmingham will be taken up by the Commissioners at once. Inspector Higgins will be accompanied on a round by President Exum and Commissioner Weatherly very soon. They will look into all the lighting conditions and their inspection will perhaps result in a serious curtailment of the present number of lights used. President Exum and Commissioner Lane agreed a few days ago that the lighting system was in serious need of betterment. It is held by the Commissioners that the arc lights have in the past been placed indiscriminately over the city and in places where favored personages reside and not in accordance with any system of lighting. Their proposed reformation of this illumination question will not result in any decrease of efficiency on the system, but it will result in a saving of money to the city and the betterment of the lighting of the streets of Birmingham.

Will Have Municipal Electric Light Plant

Chase City, Va.—The Town Council has just awarded a contract for the erection of a \$20,000 electric light plant. Contracts have also been made to macadamize Main street and Fifth street to the depot. These improvements have been made possible by a town bond issue. A peculiar thing about this bond issue is that the highest and best bidder for the bonds when issued was a local concern, to wit, the First National Bank, of which N. H. Williams is president.

Put in New Electric System

Chicago, Ill.—County officials have installed an emergency battery to be used as a relay electric service system in the county building and the City Hall after the sanitary district begins supplying current. Material for operating the battery, one of the largest in existence, was taken into the county building basement. At present the power is supplied by the Commonwealth Edison Company. The cost of installing the battery aggregates \$200,000. By the new system the saving to the city is estimated at \$140,000.

Would Build Subways

Los Angeles, Cal.—The construction of a system of subways in Los Angeles and the operation through them of lines of monorails, is contemplated by the American Monorail Company, a Baltimore corporation, capitalized at \$10,000,000. The tentative plan includes also the building and operation of monorail surface lines between Los Angeles and Pasadena and between this city and beach points, with possibly other suburban lines.

Steps Looking to Municipal Ownership of Lighting Plant

Birmingham, Ala.—Active steps will be taken within a few days by the Board of Commissioners to begin preparation for the North Birmingham light plant for supplying Birmingham city buildings with electric current. Commissioner James Weatherly in an interview agreed literally with the resolution of Commissioner A. O. Lane that the plant should be made efficient and the enormous light bill paid each year by Birmingham to the Birmingham Railway, Light & Power Company cut down to the smallest possible figure.

FIRE AND POLICE

Would Make Firemen Responsible for Safeguards Against Fire

Chicago, Ill.—Mayor Carter H. Harrison wants the Council Building Committee to vest full authority in the Fire Department to enforce protection of human life against fire. The Mayor, talking of the new ordinance to be drafted, ordered by the Building Committee, left no doubt that it is his wish that the Fire Department shall hold the responsibility for the enforcement of safeguards against fire. The Mayor in his message to the Council on this subject, which was accompanied by resolutions adopted by the Woman's Trade Union League, let it be known that the bureau proposed was to be more than a mere inspection body.

New Fire House Dedicated by Mayor

Oakland, Cal.—Mayor Frank K. Mott, Fire Marshal N. A. Ball and others were the prominent speakers in exercises dedicating the new fire house at Fifty-sixth and Dover streets. The house was recently completed, and has been equipped with modern apparatus. It will protect a hitherto inadequately protected area. A combination chemical and hose automobile has been installed in the Dover street house. The apparatus was purchased at a cost of \$5,000, and in a test made recently was found to be highly satisfactory. Two more of these combination wagons have been ordered and will arrive within a few days. Additional hose will permit of better work with the high-pressure salt water system.

Better Fire Facilities

Chatham, Va.—The double-tank chemical fire engine for the town has been received, and is of the latest and most improved type. It is of the same type as the larger engines of the large cities. The fire fighting facilities of the place are greatly improved.

Police Pension System Started

Woonsocket, R. I.—The Police Commission last week voted to establish a police pension fund, doing so under the authority of the act creating the board. Last year the Board of Aldermen, by legislative authority, was given the right to establish the pension system, but did not do so.

New System for Police to Report

Huntington, W. Va.—The new Gamewell police telegraph system went into effect last week, the officers from every district reporting to headquarters by the new system. From now on the work of the police sergeants and of the officers as well, will be greatly lessened.

Fire Engine Tested

Elizabeth, N. J.—The Webb motor fire engine, recently sold to the city of Newark for Fire Company No. 21, was given a test here late last week, which was witnessed by several town officials and citizens. Two lines of hose were laid up Mountain avenue from the engine, which stood at Central avenue and Broad street. The streams were thrown over 100 feet in the air.

Fire Auto Being Built for City

Superior, Wis.—What Fire Chief Johnson believes will be one of the most efficient pieces of apparatus belonging to the local department is being constructed at the shop attached to the Eighteenth street fire hall. It is to be an automobile hose and chemical truck. The chassis for the new piece of apparatus was purchased by the city early this spring and ever since that time the firemen have been busy getting it into shape for the body which is to go on it. Several changes were necessary to adapt the chassis to the use to which it will be put. These have now been completed and the body is being built for it. The auto truck will carry 1,000 feet of hose and also a 50-gallon chemical tank with the hose which goes with it. There will also be several ladders and other fire-fighting apparatus on the machine. The machine is a 60-horsepower and is expected to make about 30 miles an hour after being rebuilt and with the full equipment aboard.

GOVERNMENT AND FINANCE

City Gets Three Per Cent on Its Deposits

Lexington, Ky.—Mayor John Skein has completed an arrangement with the Phoenix-Third National Bank of this city whereby the city of Lexington is paid 3 per cent on its deposits in the form of sinking funds, and has thereby established a precedent in the annals of the financial history of the city.

Selling Bonds at Auction

Chicago, Ill.—A new method of putting municipal bonds on the market has been inaugurated in Chicago. The city of Council Bluffs, Ia., has sent an issue of bonds to be used for various municipal purposes and will sell them at auction to the highest bidder at one of the principal hotels here next week. The City Clerk of Council Bluffs will preside at the sale and will furnish to intending purchasers an opinion by a recognized firm of Chicago attorneys approving the bond issue.

Elections Are Proving Costly

Tacoma, Wash.—The holding of numerous elections in Tacoma is costing more than had been anticipated by many, according to the report of City Comptroller J. F. Meads for April. The report shows that the two mayoralty elections held on April 4 and 18, respectively, with the change of administration cost the taxpayers over \$7,000. The exact cost of the two elections was \$7,412.34. The recall elections against the commissioners this month resulted in fully as large an expenditure. This means \$15,000 for the four recall elections.

Citizen Asks Injunction to Prevent Bonding of District

Oakland, Cal.—An injunction suit has been started by F. W. S. Brookes against Mayor Mott and the City Council to prevent a bond issue for sewer work totaling \$102,000. Brookes, representing property owners in Oakland Sewer District No. 1, brought action as a test to determine the validity of the act under which the city was authorized to proceed. The First District is almost the same as the Upper Fruitvale Sanitary District, the bonds for which work were knocked out in the higher courts. The total issue at stake and upon which the outcome of this case will have direct bearing, is more than \$400,000. Brookes, through his attorneys, contends that the bonds of a portion of the territory of a municipality must be voted for by the entire city. This is in direct opposition to the act, which says the bonds shall be voted by residents of the district where the work is to be done. Bonding houses have refused to consider the issue until the legal obstacles shall have been overcome.

Bond Issue May Be Invalid

Oklahoma City, Okla.—It is very probable that the \$3,000,000 bond issue authorized in an act of the last Legislature, behind which the State pledged the school lands as collateral, will come to naught, and that the construction of all new buildings authorized by the Legislature will be delayed indefinitely, or until another session of that body. The point is made that the school lands were given to the State by the Government for the benefit of the school children of the State and could not be used except in the interests of educational institutions. At any rate, this opinion seems to have been the law with bond buyers, and they have refrained from bidding because of future possible complications. It is contended that the act of the Legislature in causing the bond issue to be made upon the public building fund was in violation of the constitution, and that before such proceedings could be legally binding the constitutional provision would have to be repealed, and this could only be done one way, by a vote of the people. Consequently there seems no way other than to wait for the next Legislature to provide an election on the proposition of repealing the constitutional provision which now supercedes all acts of the Legislature. Some of the new buildings provided for under the new issue are the law building at Norman, costing \$125,000; construction work on the penitentiary at McAlester and reformatory at Granite, new building at Edmond and building No. 3 for the insane at Vinita.

Town Has Three Mayors in Thirty Minutes

Harlingen, Tex.—Probably the first incident of the kind in the history of the State, if not in the entire country, occurred when Harlingen last week had three duly qualified Mayors in 30 minutes. The meeting of the City Commission was opened by the retiring Mayor, I. B. McFarland, who then proceeded to qualify John D. Hill, who was elected on April 4. Mr. Hill, who has been away since the election and has acquired some business interests in Houston that will take all his time, accordingly resigned, and then the commission proceeded to elect Judge A. W. Cunningham as his successor, who qualified at once, making three Mayors in half an hour.

Bond Money Available

Fort Worth, Tex.—With the arrival at Kansas City of the balance of the million dollars in bonds of the city that the Commercial Trust Company of that city has bought, there will be available to the order of the city \$310,000. The trust company has already paid to the city \$690,000 on the first delivery of the bonds and this second delivery will complete the million. The bonds were registered in Austin and will be forwarded at once to Kansas City. There is a second million dollars in bonds on which the same company holds an option and that block of bonds was also registered.

City Budget Goes to City Council

St. Louis, Mo.—A total appropriation of \$10,819,638.57 is carried by the annual appropriation bill, which has been sent to the City Council by Comptroller Taussig, together with the bill fixing the tax rate for St. Louis at \$2.22 per \$100 of assessment the same rate as last year. The total appropriation is \$681,802.54 larger than last year.

The heaviest expenditures are for the Police Department, \$2,098,575.47, which is \$2,420.85 less than last year; the Fire Department, \$1,094,980, which is \$4,391.51 more than last year, and the Street Department, \$1,343,244.54, which is \$31,406.78 more than last year.

Allotments for extensive work are made in the bill, amounting to \$657,308.69, as against \$235,599.28 the year before. Some of the work provided for is the completion of the Municipal Courts building and the beginning of work on the new jail building, \$325,000; the city's share of sewers and streets, \$102,325; addition to the workhouse, \$23,800; improvements in parks, \$82,105; the annual payment on Fairgrounds Park, \$50,000; new fire engine houses, \$45,985, and other new work, \$28,093.69.

Co-operation Aim of City Bureaus

Spokane, Wash.—Carrying out their idea of obtaining a closer co-operation of all city departments on all matters, the city commissioners have established an innovation in the way of a general report system, which requires inspectors of one department to report not only what they find in need of repair coming under the supervision of their own chief, but matters concerning all other departments. Under this system, which is the idea of Commissioner Fassett, inspectors in all departments—water, sidewalk, sewer, street, crematory, health, fire, building, etc.—are provided with the same kind of report blank on which they are required to report every discrepancy noticed on their inspection trips through the city, the report being forwarded to the commissioner under whose supervision the matter comes.

For instance a water inspector who found an unsanitary yard or a bad sidewalk would have to report it. This sort of co-operation has never been in effect among city departments before, but it is expected to be of material assistance.

Agree on Harrisburg Charter

Harrisburg, Pa.—The Senate Judiciary Special Committee of the Legislature had a special meeting and voted to report out the Pittsburg-Scranton plan with amendments. The changes made are the elimination of the initiative and referendum, the incorporation of that part of the Hunter bill relating to councilmanic procedure and the official authority vested in that body. Nine councilmen who are to receive a salary of \$6,500 a year each are provided. They are to be appointed by the Governor and serve until the first Monday in January, 1912. Their successors are to be chosen at the general election in November, five for four years and four for two years.

STREET CLEANING AND REFUSE DISPOSAL**Street Sweeper Will Not Be Used Any More**

Macon, Ga.—The Board of Health has adopted the recommendation of the Mayor, and decided to abolish the street sweeper. Hereafter only the "white wings" will be used. The board decided to put eight more men on the street sweeping force, equipping them with the white coats, pushcarts and brooms. It is believed that by this method the streets can be kept cleaner.

Regular Baths to Be Provided for City Dump

Huntington, Ind.—Pleased with the excellent results obtained by using the city fire engine to flood the dumping grounds west of the city, Street Commissioner Ed Smith will probably adopt this plan about twice a month to do away with the complaints of residents in that section and he expects little further trouble from that source during the time necessary in preparing plans for an incinerating plant. Since the great collection of refuse was soaked with water pumped from the river nearby disagreeable odors have been hardly noticeable. Unless some such plan is followed a repetition of the complaints to health officers will probably be the result and the Street Commissioner has determined to follow up the trip of the firemen with others at regular intervals of about two weeks. Favorable results from the soaking process arise from the fact that ashes constitute a large part of the pile of refuse to be found on the river bank near the slaughter houses. Before the rule regarding separation of garbage and ashes went into effect all varieties were dumped together. Since the two kinds have been collected separately some ashes have been deposited there when no opportunity to use it as filling material was offered. When the water pumped from the river came into contact with the ashes the chemical action following was such that features of the dump which caused complaint were remedied.

To Regulate Dumping of Refuse in City

Racine, Wis.—The general cleaning day created considerable friction regarding the dumping of refuse and called the attention of the city officials to the fact that there is not sufficient regulation and control of dumping grounds. The Mayor states that he will take this matter up with the Board of Public Works and the Board of Health in a few days and see if some more systematic and orderly way cannot be devised to regulate this in the future. It is his idea that there should be three or four official dumping grounds where all refuse, not of insanitary nature, could be deposited for filling purposes under strict inspection and regulation.

Chloride on the Streets

Duluth, Minn.—Many streets have received the first treatment of calcium chloride of the season, and many persons have been curious about the appearance of the streets. Although visible when first spread, it is soon absorbed by the surface of the street and becomes a part of it. The chloride preparation was tried in Duluth last year as an experiment, and it worked so well that it was introduced this year on a much larger scale. In addition to many streets, the boulevard and the park driveways are being treated with it.

Starts Campaign for Clean Streets

Albany, N. Y.—The directors of the Chamber of Commerce at a regular meeting of its directors decided to inaugurate a campaign for clean streets in the city. It will be in charge of the Committee on Public Improvements, of which Peter D. Kiernan is chairman. The committee will cause circulars to be placed in every home in the city asking citizens to co-operate with the city authorities to keep the streets free from paper and other refuse that is frequently thrown into the streets. The circular will make an appeal to the civic pride of every one to observe the regulations regarding the using of the streets as a dumping place. Last spring a similar campaign was undertaken with gratifying results and the city co-operated by placing receptacles for refuse.

RAPID TRANSIT**Studying City's Street Car Conditions**

Providence, R. I.—"Any consideration of the city traction problem falls far short of the mark if we consider only the boundaries of the city itself," declared J. R. Bibbins, of Chicago, in an address recently before the members of Brown University Engineering Society in Rhode Island Hall. "We must look beyond the city limits," said the speaker, "and study the situation there regarding street car conditions; for the trend of population and, therefore, the trend of rapid transit, is away from the center of every city." Mr. Bibbins is assistant to Bion J. Arnold, who is studying the street car conditions in this city, with a view to reporting matters as he sees them here and presenting recommendations for a remedy of the congestion that has been the cause of so much complaint.

Council Orders Extension of Car Line

Vincennes, Ind.—At the special call meeting of the City Council in the Council Chamber one day last week to take action on the extension of the street railway to South Vincennes, a resolution was adopted calling upon the Vincennes Traction Company to make the desired extension of their line on Main street from Seventh to Fifteenth street, and on Fifteenth street from Main to Willow street within the next six months or forfeit their franchise rights to the use of the portions of Main and Fifteenth streets designated. In addition to the adoption of the resolution, the City Attorney was instructed to draw up a notice informing the traction company of the action taken and what it is desired of them to do. Some time ago a petition signed by several hundred citizens was filed with the Council, asking that they take some action toward having the street car line extended out Main street.

City Is Soon to Have a Motor Car Line

Santa Maria, Tex.—Santa Maria is soon to have a motor car line in operation, giving the farmers and residents of this section a direct connection with the St. Louis, Brownsville & Mexico Railway at San Benito, if the plans of R. H. Kern, the St. Louis capitalist, who is extensively interested in land here, do not fail. Mr. Kern has been doing some extensive farming in this section for the past two years and early realized that for successful operations, the six-mile haul to Bixby, the nearest point on the St. L., B. & M., would have to be eliminated. With this end in view Mr. Kern has been busy for the past three months on a motor car line proposition, with the result that he now has subscribed by interested parties in this section bonuses to the amount of \$60,000. Mr. Kern says work will commence on the new line probably by May 15, any way not later than June 1, and will then be pushed to completion with vigor.

Mayor Advocates Merger of Elevated Lines

Chicago, Ill.—There has been a revival of the report that arrangements have been completed for the merger of the elevated lines, and Mayor Harrison went on record as in favor of the proposed merger, declaring it is the economical plan of operating the elevated lines. He also indorsed the idea of a consolidation of the surface and elevated lines, asserting it is something to be desired in the ultimate working out of Chicago's transportation facilities. The roads concerned in the merger planned are the South Side, Metropolitan, Northwestern and Chicago and Oak Park elevated roads. These lines operate over 177 miles of track, carry 500,000 passengers daily and represent over \$160,000,000 of capital obligations. Efforts have been made to consolidate the elevated railroads for some time, and in former attempts it has been planned to involve the surface railroads in the merger. It is expected that a merger of the elevated railroads, if successful, will be followed by the opening of negotiations with the surface roads again and that an effort will be made to put through the greater scheme as originally conceived.

City Gives Fifty-Year Franchise

Gary, Ind.—Business men of Gary, especially of the Commercial Club, are in arms because the City Council after a long and stormy session ratified a 50-year franchise to the Calumet United Railways Company. Further feeling was created when it was learned that Mayor Knotts, instead of exercising his veto, signed the franchise ordinance.

MISCELLANEOUS

Gives Park to Crawfordsville

Crawfordsville, Ind.—Harry J. Milligan, an Indianapolis attorney, has presented a tract of land, consisting of 30 acres, to the city of Crawfordsville, Ind., for park purposes. The land is situated in the east end of Crawfordsville and will be known as Milligan Park in memory of Mr. Milligan's father, Joseph Milligan, for years one of Crawfordsville's leading citizens. Crawfordsville at present has no park. Harry J. Milligan was born and reared in Crawfordsville and is president of the board of trustees of Wabash College.

City Would Settle Labor's Disputes

Spokane, Wash.—Mayor Hindley announced last week that he has definitely decided on the creation of a commission on industrial disputes. The Mayor has been in conference with the other commissioners and leaders of labor and employers on the project. He is yet undecided whether to make the commission a permanent one or to create temporary boards for separate industrial disputes, but leans to the former plan. Commissioner Coates and one or two others favor only the temporary board. If a permanent board is created the Mayor will name the city school superintendent, the president of the Central Labor Council, a minister of the gospel or priest, and probably a member of the Manufacturers' Association as four of the five members.

City to Aid Poor

Spokane, Wash.—Control of benefactions in Spokane by a municipal charities commission is the plan announced by Mayor W. J. Hindley last week on his return from a tour of the Coast cities. The Mayor's plan, admittedly an innovation in the line of relief work in cities, contemplated discontinuation of the present arrangement with the Associated Charities and absorption of its duties by a bureau operated directly by the city itself through a commission of citizens appointed by the Mayor. The Mayor states that the governing board of the Associated Charities has practically agreed to the plan. "I have become more than ever convinced after my trip to the Coast and investigation of the plan of handling charities there that revolution in the way these things are handled by cities is necessary," said the Mayor. "I believe the plan of a municipal commission and bureau is the right one."

Children Will Use Tooth Brushes Daily in School

Cleveland, O.—Five minutes of the time usually given to study will be devoted to scrubbing the teeth by the 60,000 school children of Cleveland next term. This was decided by the school officials last week following dental experiments made with a group of pupils at the Marion school. In the presence of Dr. Wille, of the Marine Hospital Service, and Dr. J. S. Marshall, of Columbus Barracks, representing the Federal Government, and a number of physicians, dentists and school officials, the 27 children of the group showed that their powers of perception, keenness of observation and general quickness of mind were better developed than those of their schoolmates. The great improvement shown in their studies after they had been submitted to a dental treatment has resulted in the tooth scrubbing order.

Street Directors to Care for City Trees

Wilmington, Del.—Directors of the Street and Sewer Department, at a recent meeting, adopted an ordinance giving the department entire jurisdiction over all trees, shrubs, plants or grass along the sidewalks or in the streets of the city. The directors also entered into an agreement with A. E. Bonsey & Co., florists and tree experts of Wilkes-Barre, Pa., to act as advisers of the department in all matters pertaining to the planting, care and conservation of trees along the city streets. The department will not appoint, for a while at least, a city forester, under authority of the law passed by the recent Legislature, but will use its own workmen under the direction of an expert from Bonsey & Co. to protect, care for and propagate trees on the streets. Bonsey & Co. offered to supply an expert to give advice, when especially called, at \$8 a day and railroad transportation.

Denver Building All of Its Playground Equipment

Most cities which have playgrounds buy their equipment ready made, but Denver not only designs but builds all its play equipment. This work is done at the playground shops located near Curtis Park. R. W. Thornton is in charge and designs the models. He has under him four

SLIDE OF DENVER MUNICIPAL MANUFACTURE

good mechanics and blacksmiths. All of the new material going in at the playgrounds is made of steel. The welding, forging, riveting, etc., is performed at the shops. The city is saving the taxpayers a considerable sum monthly by doing the work that was formerly done by private contract outside the city. The products of the shops are substantial and modern and the workmanship speaks for itself. The old wooden swings, slides, merry-go-rounds, seesaws and other apparatus in the playgrounds is rapidly being replaced by the steel material, and by the end of the Summer all of the dozen recreation places will be provided with the new kind of equipment.

Cornerstone of City Hall Laid with Exercises

Grand Forks, N. D.—Five former Mayors of the city of Grand Forks participated in the ceremonies of laying of the cornerstone of the new City Hall, a structure that will cost approximately \$85,000. A civic holiday was declared and business was suspended while the ceremonies were in progress.

City Playhouse to Cost \$52,000

Philadelphia, Pa.—The handsome brick recreation building in course of construction in Starr Garden Park, Lombard street, between Sixth and Seventh, the first of its kind to be built by the Playgrounds Committee, will be opened the latter part of May, when its splendid equipment will be placed at the disposal of children.

City Autos to Be Lettered

Brockton, Mass.—The Common Council has passed an order authorizing all city automobiles to be lettered "City of Brockton" on or before June 1, after which no automobiles may be used without such letters. A similar order was passed last year to prevent joy riding by department heads, but the autos were not lettered. The order this year provides that the letters be not less than three inches high.

Citizens Protest Against City Accepting Big Bridge

St. Augustine, Fla.—Protesting against the city accepting the burden from the county of the bridge over the San Sebastian to New Augustine, a petition has been circulated and largely signed asking the St. Johns County delegation in the Legislature to secure the passage of a measure placing the city boundary definitely at the eastern side of the San Sebastian.

Civic Improvements Due to Women's Efforts

Victoria, Tex.—The women of Victoria, who are largely responsible for the civic advancement of the town, have launched two new movements that, if successful, will greatly improve the looks of the city. One is to have the standpipe removed from the center of the public square and have a Confederate monument erected in its place. The other is to have a new county jail built on a site less prominent than the present one and convert the building now used as such into a public library. The quarters of Victoria's present library, the Bronte, have become too small. Andrew Carnegie has offered to erect a magnificent library building here if given satisfactory assurances the citizens will maintain the institution.

\$10,000 for Park Music

Milwaukee, Wis.—The sum of \$10,000 was set aside for free park concerts during the summer at a recent meeting of the Park Board. About 121 concerts will be given in the larger parks. Music will cost \$8,000, while \$2,000 has been set aside for illumination, decorations and special concerts, if found necessary. No date has been set aside for the beginning of the concerts, but the first probably will be about the middle of June.

Municipal Shop Proposed

San Francisco, Cal.—A conference with the Supervisors on the proposition of establishing a municipal shop to do the work required on the city's vehicles has been requested by a joint committee of the Carriage and Wagon Workers' Union and the Pattermakers' Association. The committee asks that provision for the shop be made in the budget, asserting that the work of the various municipal departments can be done more economically and satisfactorily in it than under the present contract system.

Place Workmen in the Parks

Birmingham, Ala.—Commissioner Weatherly has announced that he would instruct Street Commissioner Frank Gafford to place a force of workmen in the parks and clean them up thoroughly. Since the commissioners with one sweep discharged all the park keepers of the city their condition has caused considerable censure. Frequenters of the parks say that the weeds are flourishing and that trash has accumulated very rapidly. The creation of a park commission will be taken up as outlined heretofore, to be composed of some of the best-known men in the community.

Test Employees for Retirement

Boston, Mass.—The first actual steps in the wholesale removal of veterans in the employ of the city were taken when Drs. Arthur H. Davidson and Edward T. Brearton, of the Public Works Department, started to examine 266 veteran employees to see if they were incapacitated for work and eligible for retirement under the recent legislative act. Doctors will be engaged for other municipal departments during the next few days and before the end of the month the Mayor will have in his possession a complete list of every department official or employee eligible for retirement on half-pay. The Commissioner of Public Works' list of employees who will be examined includes men receiving from \$2.25 a day to \$2,100 a year. On that list are five foremen, 27 inspectors, 19 drawtenders and assistants, as well as scores of laborers, stablemen, clerks, ferryboat captains, sub-foremen, painters, blacksmiths, masons, steam engineers, machinists and teamsters.

Ohio Cities to Run Pawnshops

Columbus, O.—The Bertsch municipal pawn department bill, said to be the first of its kind, has just become a law in Ohio. The new law takes its name from Joseph F. Bertsch, its author. Some foreign countries have such departments, but they have been established by the cities without asking the State for authority or power therefor. The new law is intended to be of benefit to the worthy poor, and its working in Ohio will be watched with interest by the authorities of other States with a view to adopting some such measure in their localities.

Plan Municipal Amusement Commission

Los Angeles, Cal.—Managers of the large theaters of Los Angeles will be invited to appear before the committee of citizens who are working on a plan to have established a municipal amusement commission to supervise all commercialized amusements in the city of Los Angeles. The managers will be given an opportunity to discuss before the body the advisability of establishing such a commission for amusement censorship. The recommendation of Guy Eddie, City Prosecutor, that a censor be appointed to divide the responsibility of preventing the production of objectionable shows, has been endorsed by the committee. The committee, consisting of well-known reform and civic workers, discussed the proposal for a municipal amusement commission and decided to hear the views of theatrical managers at its next meeting. Several moving picture show men were present and addressed the committee.

City Improvements Increases Real Estate Values

Sparta, Ga.—The city of Sparta is spending \$40,000 on putting in a system of water works and sewerage and street improvements. It is expected now that water will be turned on in July. Real estate values in the city as well as in the county are going up very fast as a result of the public improvements now going on.

Gives Fountains to City

Connersville, Ind.—Roy Williams, a former resident of Connersville, now a wealthy contractor of Cairo, Ill., has given Connersville four drinking fountains. A local concern is to erect the fountains at his expense. One will be placed near the court house, one near Fifth street, one near Sixth street and one near the First M. E. Church. These fountains will have drinking places for horses and men and will cost about \$1,000.

School Children Set Out Catalpa Trees

Providence, R. I.—Arbor Day was made more significant in this city this year by the distribution of 30,000 young catalpa trees to the school children for planting. The trees were given by John Shepard, Jr., of Boston and Providence. Two trees were planted and dedicated to the late Julia Warde Howe.

Would Distribute Maps of City Without Cost

Norfolk, Va.—The Industrial Commission have taken steps to obtain 500 official complete maps of Norfolk city for free distribution to commercial interests which may request them. It seems that the city councils some time ago appropriated \$1,000 to get out a complete map of Norfolk city showing the ten wards. These maps were placed in the city engineer's office, where they may be had for \$1 per map. The Industrial Commission has requests every day for an official map of the city. Consequently a committee was appointed to wait upon the Board of Control and see if authority cannot be gotten to obtain copies of the maps for free distribution.

City Beautiful League Planned for Asheville

Asheville, N. C.—A movement is on foot here to organize in Asheville a "city beautiful league" similar to the league formed in Knoxville. Alderman R. L. Fitzpatrick, of the City Council, who has for years favored such a move, is interested in the matter and is pushing it. Mr. Fitzpatrick, while on the board several years ago, started "cleaning-up day" in Asheville, which has proved a vast benefit to the town. Mr. Fitzpatrick says if owners of vacant properties in Asheville will convert the vacant lots into vegetable gardens, flower beds, etc., and remove the trash and tin cans, etc., from their back yards, Asheville would take a long step forward. It is believed that something will come of the movement.

Paris Wants Pictures of Chickamauga Park

Chattanooga, Tenn.—Mr. E. E. Betts, of the Chickamauga Park Commission, feels pretty good over the fact that Paris, France, has officially taken notice of the fine road and park work that has been done in Chickamauga Park, and the possibility that Paris may obtain practical ideas from a humble, though very efficient, Chattanooga road builder. The letter which reached the Park Commission was addressed to the Honorable Director of Chickamauga National Military Park and reads as follows:

We should be greatly obliged if you would lend us the report on your cemeteries and some photographs, which we may use for the exhibition of our French Garden-City and Town-Planning Association. I have read the most interesting report which appeared in your work in "Park & Cemetery." I should add that we would be very pleased to have you visit—when you have the opportunity—to come to Paris.

With anticipated thanks.

Yours faithfully,
GEORGES BENOIT-LEVY.

Of course Mr. Betts will supply the desired information to the Paris association and will also send a strong invitation to the Parisians to make a visit to Chattanooga and see for themselves just what God and the government, assisted by man, money and brains, can do in the way of making scenery and building great parks. As to accepting the invitation to visit Paris—that is a question which Mr. Betts will take under advisement.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Obligations of City of Manila, P. I.

Verisimo Vasquez Vilas (Plaintiff in Error and Appellant) vs. City of Manila.—The present city of Manila, re-incorporated by the Philippine Commission with substantially the same municipal powers, area and inhabitants as the Spanish municipality of the same name, is liable upon municipal obligations incurred prior to the cession of the Philippine Islands by the treaty of Paris of December 10, 1898, to the United States. A claim under a contract to supply coal to a municipality for use in operating its water works system, apparently entered into upon the general credit of the city, does not constitute a charge upon the property and funds held in trust by the city to be devoted to the establishment and maintenance of such system.—31 S. C. R., 416.

Change in Grade of Street—Liability for Damages

Morris et al. vs. City of Indianapolis et al.—Since Act March 6, 1905, governing cities and containing no provision making cities liable for damages from change in the grade of streets, repeals Acts 1867, authorizing the recovery of such damages, an abutting owner in the city of Indianapolis may not urge that Acts 1891, repealing the latter act, so far as it applied to the city of Indianapolis, denied to him the rights guaranteed by the fourteenth amendment of the Federal Constitution, based on the fact that the Acts of 1867 established one rule for some cities, while the act of 1891 established another rule for the city of Indianapolis. The Supreme Court will as a general rule adhere to its own decisions wherein the rules of the common law are expounded, and it need not accept and follow the common law as expounded by the Supreme Court of sister States.—Supreme Court of Indiana, 94 N. E. R., 705.

Regulating Installation of Electrical Appliances

Ex Parte Cramer.—An ordinance of a city regulating the installation of electrical appliances inside and outside all buildings subject to the supervision of the city electrician, and requiring permits for such installation, and the payment of fees for the inspection of the work, is valid as a proper exercise of the police power of the city to adopt measures to protect life and property. License and inspection fees levied under the police power of a city are not an "occupation tax" within the Constitution, article 8, section 1, providing that persons engaged in mechanical and agricultural pursuits shall not be required to pay an occupation tax.—Court of Criminal Appeals of Texas, 136 S. W. R., 61.

Permit to Erect Telephone Poles

East Tennessee Telephone Company vs. Board of Councilmen of City of Frankfort et al.—Where an ordinance gives a telephone company permission to place its poles on the street and to carry the wires across a city bridge, being a mere permission, the city does not part permanently with the control of the subject, and may revoke such permission.—Court of Appeals of Kentucky, 136 S. W. R., 138.

Police Judge—Removal

State ex rel. Working, Police Judge, vs. Mayor and City Council of City of Helena.—Revised Codes, authorizing the City Council to remove any officer on written charges after notice by a two-thirds vote of all the members-elect, is in consonance with the Constitution, subjecting officers not liable to impeachment to removal in the manner provided by law, and the statute is a proper exercise of the legislative authority granted, and a police judge of a city may be removed in a proper case by the City Council.—Supreme Court of Montana, 114 P. R., 777.

Widening Streets—Removing Trees

Jeffress vs. Town of Greenville.—Where a town charter gives it express authority to widen streets and remove obstructions therefrom, its act in removing trees on widening streets will not be interfered with in the absence of oppression.—Supreme Court of North Carolina, 70 S. E. R., 919.

Proceedings to Establish Water Works—Validity

Edwards et al. vs. City of Cheyenne et al.—In absence of a contrary constitutional or statutory provision, the questions whether proposed city water works for which land is sought to be condemned are required by the city's lawful needs, and when and how the works are to be constructed, are solely for the determination of the city, and the validity of the condemnation proceedings cannot be attacked on the ground that the purpose for which the water, made available by the proposed works, was used, was unlawful.—Supreme Court of Wyoming, 114 P. R., 677.

Water Main—Right of Way

Tone et ux. vs. Tillamook City.—A deed to a city of a right of way for a pipe line for its water system, which recites that the grantors shall have the free use of a specified quantity of water from the pipe lines on compliance with enumerated requirements, does not require the city to perpetually convey water through the pipes, but it may at any time relieve itself from the obligation by taking some other route than that across the land conveyed.—Supreme Court of Oregon, 114 P. R., 938.

Ownership of Dirt in Street

John P. Sharkey Company vs. City of Portland et al.—The abutter on a street in Portland owns the soil to the center of the street, and he still owns it when it is excavated, unless needed for the improvement of the same street, and he has the right to take it away, provided he does so promptly; and, if there is a place as convenient for the contractor to dump surplus dirt as to place it elsewhere, it is the right of the owner to have it dumped at such place, if he so indicates at the commencement of the work; but, as such dirt is usually valueless to the abutting owner, he is deemed to have abandoned his claim thereto, unless seasonably made, and the owner cannot require the contractor, at the latter's own expense, to place the dirt at a distant or inconvenient place, in which event he must remove the dirt promptly himself.—Supreme Court of Oregon, 114 P. R., 933.

Violation of Void Ordinance

Glendinning vs. City and County of Denver.—Accused could not be convicted for violating an ordinance requiring a license to sell oleomargarine made in imitation of butter; it being repugnant to Revised Statutes 1908, making one guilty of misdemeanor who sells an article in imitation of yellow butter.—Supreme Court of Colorado, 114 P. R., 652.

Franchise of Water Company—Construction

Madera Water Works vs. City of Madera et al.—The franchise of a water company to occupy and use the streets of a city must necessarily rest in a grant from the State, and the measure of its rights is to be determined from a construction of such grant purely as a matter of contract. The public grant of a franchise, whether by a Constitution, statute or municipal ordinance, is to be strictly construed in favor of the public, and nothing passes by implication. Constitution California, which provides that, in any city not itself operating works for supplying water or light to its inhabitants, any person or corporation organized under the laws of the State shall have the privilege of using the streets for the purpose of constructing and operating such works, subject to municipal regulation, does not grant an exclusive franchise to a corporation constructing water works thereunder, nor can such exclusive right be implied, and its rights are not violated by the construction and operation of competing works by the city.—United States Circuit Court, 185 F. R., 281.

City as Tenant at Will—Void Lease

Commercial Wharf Corporation vs. City of Boston.—There can be no implied contract marking a city a tenant at will of a location for a boat landing; there being no statute authorizing it to expend its income to procure or maintain such a location, and there not only being no evidence that its occupation conferred on it some pecuniary gain, benefit or advantage, but no evidence that the premises were required for any general or special municipal use, or were provided for or occupied by any of the various departments of the city.—Supreme Judicial Court of Massachusetts, 94 N. E. R., 805.

Special Assessment—Reversement

City of Chicago vs. Willoughby et al.—The failure of a city to file the remanding order of the Supreme Court reversing a judgment sustaining objections to a special assessment for benefits for widening a street and remanding the case operates as an abandonment of the proceeding against the property, but not as an abandonment of the right to levy any assessment against it to pay awards made in the condemnation proceedings, and the city may cause a new assessment under Cities and Villages Act, 1872, as amended by Hurd's Revised Statutes, 1893, authorizing a new assessment where an assessment has been set aside by any court, etc.—Supreme Court of Illinois, 94 N. E. R., 513.

Assessments—Sufficiency of Ordinance

Borden vs. City of Brockton.—The mayor and aldermen of a city, having the powers of selectmen of towns under Statutes 1881, could order the construction of a sidewalk under the power given by Revised Laws, to order special repairs, but where the order for a sidewalk fails to state that in the judgment of the mayor and aldermen public convenience requires the building of the sidewalk as is necessary in acting under either of the three systems of sidewalk assessments authorized by Revised Laws, it is not apparent whether the order was made under the act as to specific repairs or under the assessment act, and the order cannot be made the foundation of an assessment.—Supreme Judicial Court of Massachusetts, 94 N. E. R., 558.

Building Ordinance—Reasonableness

Lane-Moore Lumber Co. vs. City of Storm Lake.—A provision of an ordinance regulating the construction of buildings within the fire limits which requires the builder to obtain a permit from the mayor is not unreasonable. An ordinance requiring builders constructing buildings within the fire limits to obtain a permit from the mayor is not invalid as delegating the legislative power of the council.—Supreme Court of Iowa, 130 N. W. R., 924.

Defective Highways—Injuries.

Madisgan vs. Town of Schaghticoke.—The location and character of a highway and the extent of travel thereon are to be considered in determining whether it was in a reasonable state of repair at the time of an injury thereon.—New York Supreme Court, 128 N. Y. S., 800.

Highways—Cost of Construction

Town of Queensbury vs. City of Glens Falls.—Charter of City of Glens Falls, providing that the city shall be liable for its proportional share of the indebtedness of the town of Queensbury, and that, when the charter shall take effect, the money belonging to the town shall be proportionally divided except the highway fund, did not impose the whole burden of constructing a State road on the town outside the city limits, or permit the town to retain any moneys on hand except those raised by tax for the annual repair of highways, and hence the city is liable for its proportional share of the cost of constructing State roads.—New York Supreme Court, 128 N. Y. S., 833.

Street Accidents—Notice—Statutes

Gribben vs. City of Franklin.—Under Burns' Annotated Statutes 1908, providing that no action for injuries from defects in any street, alley, highway or bridge shall be maintained against any city or town unless written notice of the time, place, cause and nature of such injury shall be given to the clerk or mayor, or the board of trustees of such city or town, failure to give the statutory notice precludes the right to maintain such action, and actual notice to a member of the common council does not dispense with the statutory notice.—Supreme Court of Indiana, 94 N. E. R., 757.

Rights and Remedies of Taxpayers

Iglehart vs. City of Dawson Springs.—Where the publication of an ordinance necessary to the validity of bonds was not made as required by law before a taxpayer's action was begun but it was duly published shortly afterward and before the bonds were issued, there is a sufficient publication.—Court of Appeals of Kentucky, 136 S. W. R., 211.

Civil Service—Appointments

People ex rel. Sullivan vs. Mayor, etc., of City of New York.—Under Laws 1909, providing that every clerk or assistant employed in the office of the Richmond county clerk, January 1, 1909, and continuing in office until the act took effect, and who prior to January 1, 1910, passed a noncompetitive civil service examination, should be retained and assigned to perform the same services in the clerk's office, an incumbent in the clerk's office on January 1, 1909, who failed to pass a noncompetitive civil service examination before January 1, 1910, but who was re-examined and finally passed in February, is not qualified for appointment under the terms of the act.—New York Supreme Court, 128 N. Y. S., 776.

Employment of Special Counsel

Vicksburg Water Works Co. et al. vs. Mayor and Aldermen of City of Vicksburg.—A city may employ associate counsel to assist its city attorney in any case where its authorities deem it necessary.—Supreme Court of Mississippi, 54 S. R., 852.

Street Accident—Proximate Cause

City of Louisville vs. Hart's Adm'r.—Decedent, through defects in a street rendering it unsafe for travel, was thrown from his wagon upon a street car track immediately in front of a car running at a dangerous and negligent rate of speed, and was thereby killed. Held, that the negligence of both the city and the street railway company can be deemed the proximate cause of the death.—Court of Appeals of Kentucky, 136 S. W. R., 212.

Sufficiency of Sewer—Liability

City of Louisville vs. Leezer.—A city undertaking to establish a system of sewers must provide for the increase that may naturally be expected in population, and that sewers when first constructed are adequate to meet the demands of conditions then existing does not relieve it from responsibility, if, by growth of population, they become inadequate. Where a sewer becomes increasingly inadequate by the increasing demands on its capacity, due to the growth of the city, each recurrence of injury attributable to the changed condition is a separate cause of action, and limitations do not begin to run until the accrual of such a case of action.—Court of Appeals of Kentucky, 136 S. W. R., 223.

Different Systems of Sewer Construction

Holt Lumber Co. vs. City of Oconto et al.—Under Stat. 1898 relative to city sewers, providing three different modes of constructing and maintaining sewers (1) by the city at large; (2) by sewer districts; and (3) by abutting property owners, a city which has adopted such subchapter as part of its charter does not, by passing an ordinance adopting the sewer district plan, exhaust its power in that respect; but in view of other sections such adoption of such system in no way abrogates the city's right to avail itself of any of the other methods, or of any provision of the subchapter.

Constitution, providing that the rule of taxation shall be uniform, is not contravened by permitting a city, after adopting a system by which sewers shall be constructed at the expense of sewer districts, to adopt a system by which main sewers shall be constructed at the expense of the city at large, though one who had to contribute to the expense of constructing a main sewer under the first system is obliged to also contribute to the expense of constructing another main sewer outside his sewer district under the second system.—Supreme Court of Wisconsin, 130 N. W. R., 709.

Regulation of Gas Rates

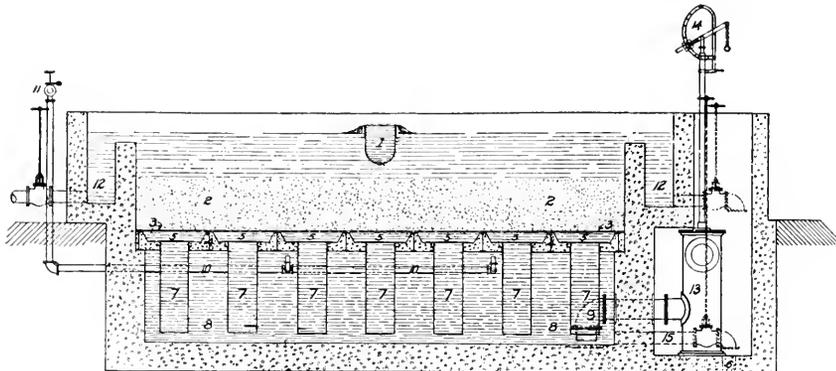

State ex rel. Jackson, Atty.-Gen., vs. Redding, Mayor, et al.—When a grant is made by a city of the second or third class of a franchise to supply gas to the city and its inhabitants for a term of years, which prescribes the plan on which gas is to be distributed and the rates which consumers will pay therefor, it is competent for the mayor and council of such city thereafter to make reasonable changes in the rates from time to time, and section 749 of the Gen. Stat. 1909 does not require that an ordinance making such changes shall be submitted to the electors for their approval or rejection.—Supreme Court of Kansas, 114 P. R., 1094.

MUNICIPAL APPLIANCES

Reisert Patent Filter

The Reisert water filter, placed on the market by the Reisert Automatic Water Purifying Co., 30 Church street, New York City, employs compressed air and clean water for washing the filter. The filter bed, it is stated, is washed out in about a minute, using about 25 gallons of water per square foot of filter surface. Another advantage claimed for the filter is that it delivers clean water immediately after

forced upward through the filter bed with uniform pressure over the entire area. To create this uniform pressure the area of the perforations in the filter bottom must be less than the area of the pipes, 7. In this manner every portion of the filter bed is reached by the wash water. The particular advantage of the Reisert filter is this, that the wash water is clean water and hence cannot add new impurities to the filter material. The wash water overflows with

REISERT GRAVITY FILTER

washing. It is stated that there are 3000 Reisert filter installations in operation throughout the world, varying in size from small filters of 50 or 100 gallons per hour to filters of many units delivering 200,000 gallons per hour.

The new improved Reisert patent gravity filters are made rectangular or circular in shape to meet individual conditions. They are constructed either of concrete, as shown in the illustration, or of steel, or of a combination of these two. The illustration shows a sketch of a rectangular filter made of concrete. The raw water enters the filter proper from the trough, 1, and overflows on to the filter bed, 2. This filter bed is supported by a perforated plate, 3, provided if necessary with a wire screen. The perforated plate rests on a reinforced concrete floor, 4, which is the tight bottom of the filter, and is so divided that a series of parallel pans or troughs, 5, are formed under the filter bottom, 3. In these parallel troughs rows of pipes, 7, of suitable diameter and suitably spaced, are set, which extend to within a short distance of the bottom of the clean water compartment, 8.

The raw water percolates through the filter bed, then passes through the perforations of the filter bottom into the troughs and finally through the pipes into the clean water compartment and to the outlet, 9.

When the impurities in the raw water begin to clog up the filter, so that it no longer delivers the proper amount of water, as indicated by a regulating device, 14, they should be washed from the filter bed. To accomplish this, the clean water outlet is closed and the air cock, 11, is opened. The compressed air entering the clean water compartment at the top through an air manifold, 10, forms an air piston under the reinforced concrete floor, 4, and this air piston forces the filtered water out of the clean water compartment and up through the system of pipes, 7. The filtered water, by means of the troughs, 5, above the pipes, spreads out uniformly under the filter bed, and is

the impurities into the gutter, 12, and from there runs off to the sewer, 6. When the water overflowing into the gutter, 12, runs clear, the air pressure valve is closed, the air relief valve, 17, and the clean water outlet valve opened; the filter material then settles by gravity to its original position in clean water. The raw water then follows, forcing the clean water through the filter material. In doing this the suspended matter in the raw water will deposit a film in the top layer of the filter bed as an important aid to clear filtration. If the washing is done prop-

acter of the filter bed can only be determined when the quality of the raw water is known. If these are known the flexibility of the Reisert apparatus is such that it can be charged and operated under varying conditions.

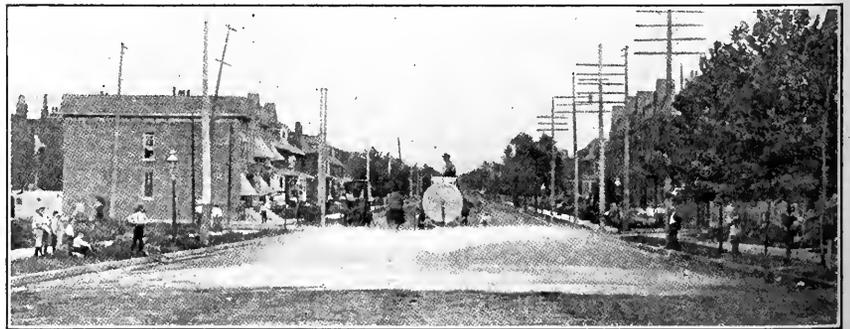

In the Reisert filter system a piston of clean water is forced through the perforated bottom at a uniform pressure and speed and then through the entire filter bed, removing the accumulation of impurities by one simple and effective operation with a minimum quantity of water.

These filter units are made of varying size to meet individual requirements. For large installations units are placed side by side in such a manner that each one can be operated and washed separately. This permits continuous filtration, as only one unit at a time is out of commission when washing, while the rest of the installation continues to filter.

The same company makes a pressure filter, circular in section for rapid filtration. They also manufacture water softeners on the Reisert-Dervaux patented system.

Sanitary Automatic Street Flushing Machine

The street flushing machine made by the Sanitary Street Flushing Machine Company, Carleton Building, St. Louis, Mo., has been described in the MUNICIPAL JOURNAL AND ENGINEER, and its construction and operation is well known. The use of the machine with a sprinkling attachment, as shown in the illustration, is perhaps not so generally known. The advantage of air pressure as applied to the machine is that the whole width of the street may be sprinkled at one time. A gravity wagon has to make two or three trips over a street in order to wet it down from curb to curb. Unless the operator is very careful a considerable proportion of the water will run off without accomplishing any useful purpose.

SANITARY STREET FLUSHING MACHINE USED AS SPRINKLER

erly the filter will deliver clean water at all times.

The time consumed in washing is of course proportional to the amount and character of the impurities in the water, but for ordinary water supplies it should be less than one minute. This one operation is the only one required to clean the filter material thoroughly.

The quantity of compressed air and the quantity of clean water necessary for washing the filter bed will be directly proportional to the quantity and quality of the impurities in the raw water removed by the filter bed, and to the character and depth of the latter. Naturally the amount of the compressed air, the capacity of the clean water chamber, and the depth and char-

The sanitary flushing machine may be used at night for street flushing and in the daytime for sprinkling, thus reducing the capital charge against the operations of the street department. At a meeting of the American Society of Civil Engineers, where road preservation and dust prevention was the special topic of discussion, the question of scientific watering was taken up by a prominent engineer. He advocated both as a means of preserving macadam roads and preventing dust the use of a street sprinkler which would cover the whole width of the road lightly at a single operation. The sanitary automatic street flushing machine used as here illustrated seems to conform to the requirements.

Hoisting, Elevating and Dumping Bodies for Motor Trucks

PATRICK LALLY & SONS, 21-25 West First street, Boston, Mass., who have had 35 years' experience in the manufacture of elevating and dumping bodies for handling materials in bulk have adapted their old apparatus, as well as devised new, for use in connection with motor commercial vehicles. One of their devices, called the Atlantic side dump, not illustrated here, consists of a body which works on a turntable, and can be dumped on either side, held at any angle or released and allowed to drop to the sidewalk to give the

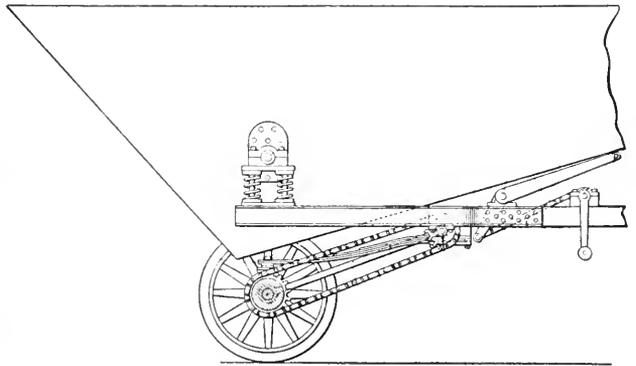

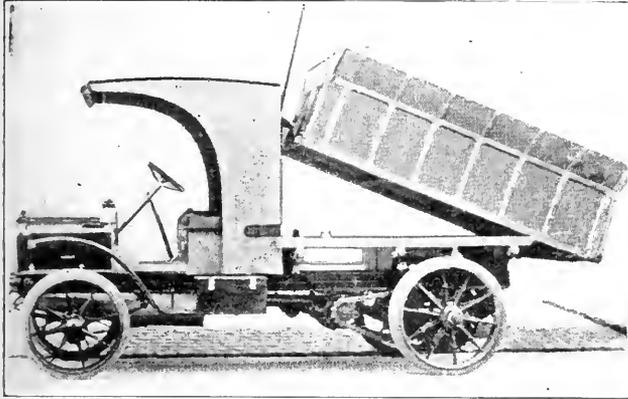

shelled on the frame, and so constructed and balanced as to dump over the rear axle. The fittings and body hanger are all of steel castings.

Wire-tied Cement Sacks

THE use of wire in tying cement sacks has rapidly come into favor throughout the cement industry. The general opinion of the trade is that the wire tie is greatly superior. The two types of wire tie that have come generally into use are known as the Bates and Curry ties. The illustration shows a sack tied with the Curry tie, and on the front of this sack will be seen a

lamps. At 1 o'clock in the morning we send along a second impulse, which puts out all the lights in Longmeadow, but leaves those in West Springfield burning. At daybreak a third impulse is sent along, which extinguishes the lamps in West Springfield and leaves them ready for the evening impulse, which puts them on again."

According to reports of the technical press automatic gas lighting on the impulse system has met with considerable success and has resulted in a considerable saving in gas. It should be borne in mind also that gas is generally sold abroad at lower prices than those prevailing in this country. It is often

END DUMPING AUTO TRUCK WITH PERFECTION VERTICAL FRAME HOIST

GARBAGE WAGON WITH WATER TIGHT STEEL BODY—DUMPS OVER REAR AXLE

load a free discharge. This wagon is a convenience in dumping in a street where an end-dumping body would cause the street to be obstructed. The reproduction shows an end-dumping vehicle fitted with the Perfection vertical frame hoist, one of the older inventions of the company. This is claimed to be more substantial than chain hoists. In dumping the driver elevates the front of the wagon body by turning a crank, which, by means of a bevel gear and pinion, revolves a vertical rod having a substantial screw thread. This runs in a corresponding threaded bracket on the front of the body, which is pivoted. The change in the angle of the rod is not sufficient to throw the gears out of mesh.

Curry tie before it is put into place. This tie is fastened by bringing the wire around the neck of the sack. Then the loops on the ends are caught on a tool that is made after the style of an automatic screwdriver, having a spiral shaft and a head fitted with hooks to engage the loops. One pull on the handle of this tool causes the head to revolve a sufficient number of times to twist the wire tightly around the neck of the sack. The two small loops act to form a handle for use in untwisting the wire. In order to unloosen the tie it is only necessary to take hold of the loops and untwist the wire. Two or three turns are sufficient to untwist it, so that it will come off the sack. This may be done almost while a man would be reaching for his knife if he were working on string-tied sacks.

stated that pressure lighting systems are impracticable in this country because the pressures of gas are less uniform. Our gas works employ pumps to increase the normal pressure over certain sections of the distribution system. This is commonly known as the booster system. It is claimed that the impulses created in the ordinary operation of the boosters would be sufficient to operate the delicate mechanisms in the automatic lights and turn the lights on or off at times not down on the schedule.

The second illustration shows a portion of the outlines of a garbage wagon. This is a steel body, made liquid tight, with fantail back, and is mounted on a chassis of special design, with springs

Kilchman Automatic Street Lighter

THE Springfield Gas Light Company Springfield, Mass., is handling the Kilchman automatic street lighter, which is manufactured in Switzerland. The device operates by a pressure impulse on a float in mercury. One hundred and fifty-one of these lights have been installed in Springfield, and according to General Superintendent H. Burgi, of the company, they work to perfection. He describes the method of operation as follows:

STREET LAMP FITTED WITH KILCHMAN AUTOMATIC STREET LIGHTER

"Here they are working under very adverse circumstances; that is, we have the lighting of the town of Longmeadow, where the lamps are put on in the evening, extinguished at 12 o'clock; and then we have some lighting in the town of West Springfield, where the lamps are lighted in the evening and stay lighted all night. Longmeadow is about nine miles and West Springfield about five miles from the works where the impulse is put on.

"During the evening lighting time we send an impulse in the shape of a raise in pressure about 1 inch above the ordinary pressure, which goes along all the mains and puts on all the

SACK PROPERLY TIED WITH CURRIE TIE

NEWS OF THE SOCIETIES

Third National Conference on City Planning.—The conference was held in Philadelphia, May 15-17, and the program heretofore announced was carried out. On Monday, the first day of the conference, the visiting delegates, about 250 in number, after visiting the historical places of interest in and about the city, attended two sessions, one in the Mayor's reception room and the second in the Clover Room of the Bellevue-Stratford in the evening.

The delegates were greeted by Mayor Reyburn, who extended the welcome of the city to the visitors. He told of the great development of Philadelphia and declared that the planners of this city would be greatly assisted by the advice of experts from many of the principal cities of the world. The Mayor also said that if the plans were properly worked out the city could be beautified without increasing taxation.

F. L. Olmsted, chairman of the executive committee, replying, said that the population of large cities would steadily increase and the question is how will the masses be provided for.

The general topic of the first conference was Municipal Real Estate Policies. The principal address was on German Municipal Real Estate Policies, and the speaker was Frederic C. Howe.

Out of the mass of the first day's discussion there loomed one topic probably of paramount importance in this nation in connection with city building. This concerned the right of a community to place the community interests above those of the owner of private property.

Experts told how, in Germany and England, thoroughgoing, efficient and well ordered systems are in vogue, whereby the health, convenience and happiness of the whole community are of higher importance than the liberty of the individual to use his property as he pleases.

It was asserted by some speakers—one of whom is a mayor in Pennsylvania—that such a paternalistic policy as obtains in Germany would not be acceptable in this country. In reply to this almost all the speakers declared with emphasis that in all instances where the best interests of the whole city are at stake the liberties of the individual should be made subservient to those of the community.

Over and over again it was declared—and applause invariably followed the declaration—that Americans must get away from the notion that any individual right should clash with a community right to the detriment of the latter. England's experts, especially, laid emphasis on this point, and from Socialistic Milwaukee came the mayor elected on a Socialistic ticket with the prophecy that the time is fast drawing near when we will "build our houses on the hilltops and our smokestacks in the valleys, no matter what the right of the individual may be."

At the evening session at the Bellevue Stratford Ernest Flagg spoke on Public Buildings, and F. M. Day on the Location of Public Buildings in Parks and Other Public Open Spaces. Mr. Day held that no buildings or monuments or statues should be placed in small parks, because, in his opinion, they deprive the landscape of its rural aspect. With this view Thomas Mawson, one of England's foremost experts, disagreed, and he pointed out European examples to back up his opinions.

Mr. Day dwelt in his paper upon the urgent necessity of guarding public parks and squares from the erection of buildings and other structures which are not imperatively demanded for use.

President Olmsted and William W. Emmart, Baltimore, also addressed the evening meeting.

At the third session, Tuesday morning, Lawrence Veiller spoke on Buildings in Relation to Street and Site.

Mr. Veiller declared that, contrary to the general belief, city planning will not solve the housing problem, which, he said, is in America largely a sanitary problem, one of good municipal housekeeping, the prompt removal of garbage, rubbish and other waste materials from the homes of the poor, the cleanliness of streets and alleys, the provision of adequate water supply in convenient locations, of proper sanitary conveniences in the place of antiquated expedients.

In three important points, however, city planning, the speaker said, touches the housing problem—the regulation of the height of buildings, the depths of lots and alleys. To the deep lot he traced most of the housing evils so far as they relate to land overcrowding. He analyzed conditions in various American cities to show that there has been no system in the laying out of blocks and lots in order to adapt the land to the uses for which it was intended in the various districts of the cities. The speaker advocated for large cities and industrial towns lots not exceeding in depth twenty-five or thirty feet. In his scheme, which he admitted is radical and startling, he would have no back or front yards for the reason that they become gatherers of contaminating rubbish, and he would have the houses built in continuous rows.

The English experts disagreed with Mr. Veiller that workmen's houses in cities should not have open spaces about them.

At the fourth session, the question of how to pay for city planning was taken up. Lawson Purdy, New York, spoke on Taxes, Assessments and Condemnation. Speaking of land condemnations, he said it would be an ideal condition if certain judges devoted themselves exclusively to land cases. He advocated the policy of having the municipality purchase land in excess of that needed for improvements and sell it afterwards. In this way the whole cost of an improvement could often be paid. In the course of the discussion following the paper Professor Frank J. Goodnow, Columbia University, maintained that American city governments leave development almost entirely in the hands of private individuals who develop for their own profit. He also pointed out that transportation facilities now privately controlled tend to develop cities for private interests rather than the public good. He said all city planning should be thought out with a view to the social, not financial or theoretically just, effects of the planning. Taxation, he held, should be regarded not as a means for getting money, but as a social instrument.

At the fifth session the question of harbor front improvements and docks was taken up, and the speakers were Calvin Tompkins, Dock Commissioner, New York, and Joseph Hasskarl, Director of Department of Wharves, Docks and Ferries. Each speaker referred specially to the conditions in his own city. Conditions in Baltimore were also briefly described by Oscar F. Lackey, Harbor Engineer.

The sixth conference dealt with streets and was more technical than the other meetings. Nelson P. Lewis, Chief Engineer, Board of Estimate and Apportionment, New York, was chairman of the meeting. The papers were by C. M. Robinson, on Narrowing of Private Residence Streets as Affecting Tenant and Owners, and by John Nolen on Standardized Street Widths.

The seventh conference dealt with administration and legal methods. The principal address was by A. W. Crawford, on Principles of a Uniform City Planning Code.

The social features of the convention were as follows:

Automobile ride to points of interest about the city.

Luncheon given by Mayor John E. Reyburn for men.

Luncheon for women at New Century Club, 124 South Twelfth street.

Reception by the Colonial Dames of America at the Randolph Mansion, East Fairmount Park.

Banquet by the City Club of Philadelphia at the Bellevue-Stratford Hotel.

At that banquet the conference was spoken of as one of the most important events in the history of things which really count in the everyday lives of citizens. Illuminated by the first municipal exhibition of city planning ever held in the country, an exhibition described by the experts as remarkable, the conference was declared to be epoch-making in the world-wide fight which is just beginning to be waged in the interests of a city which shall be useful, healthy, happy and beautiful for all of the people, and not only for a small class of the people.

The exhibition in the city hall will remain open until June 15. The exhibits occupy both sides of the corridors, half a mile in length.

League of American Municipalities.—The fifteenth annual convention of the League of American Municipalities will be held in Atlanta, Ga., October 4, 5 and 6, 1911. Important topics will be discussed, among them being: "Municipal Insurance," "Taxing Personal Properties," "Commission Government," "Garbage Collection and Disposal," "Public Service Franchises."

National Fire Protection Association.—One of the principal subjects for discussion at the coming meeting of the National Fire Protection Association will be private fire departments and fire drills. The association already has a pamphlet on the subject, which was recommended to the National Board of Fire Underwriters in 1902 and published and circulated by that body. This pamphlet, however, deals almost entirely with private fire brigades. The matter of fire drills of school children and employees in mercantile and manufacturing establishments has never been thoroughly worked out. The discussion will be opened by R. H. Newbern.

Ohio Society of Mechanical, Electrical and Steam Engineers.—The Society will hold its twenty-third meeting May 18-19, in the Ellis Club Auditorium, Youngstown, O. The following papers will be presented: "Flue Gas Analysis," Joseph W. Hays, Chicago, Ill.; "The Engineering Features of the Columbus Garbage Reduction Plant," Irwin F. Osborn, Columbus, Ohio; "Industrial Motor Control," D. Martignone, Cleveland, Ohio; "Hydro-Electric Development in the Central West," Paul M. Lincoln, Pittsburg, Pa.; "Centrifugal Blowers," Dr. Lowenstein, Schenectady, N. Y.

American Water Works Association.—The programme for the thirty-first annual convention at Rochester, N. Y., June 6-10, has been announced as follows:

Monday, June 5, 1911—Secretary's office, Powers Hotel, parlor floor, adjoining Assembly Hall. Open at 8 A. M. for registration of members and guests and transaction of other business. Registration by card, and members are requested to be particular to register on the proper color card. Active members, red; associated members, blue; guests and ladies, white. Committee room, parlor opposite Secretary's office. Committees will meet at call of Chairmen. Eight o'clock P. M., Reception in banquet room, Powers Hotel, under the auspices of the Ladies' Committee. Light refreshments, dancing.

Tuesday, June 6, 1911—Forenoon session, nine o'clock. Reception by Hon. Hiram H. Edgerton, Mayor of Rochester. Regular order of business. Calling of Roll. Reading of Minutes. Election of Officers. President's address. Reports: Executive Committee, Secretary-Treasurer, Finance Committee, Publication Committee. Afternoon Session—Half-past one o'clock. Reports of Special and Standing Committees—Committee on Electrolysis, Fire Protection, Water Works Standards, Depreciation, Uniform Annual Reports and Accounts, Reorganization, Special Committee on National Bureau or Department of Health. Reading of papers: "Fire Line Meters, a Comparison of Efficiency," George Houston; "Pumping Station Management," Thomas McMillan. The men of the association are invited to be the guests of the Bartholomay Brewing Company at their brewery from five to seven on the evening of Tuesday, May 6, 1911. Evening Session—Eight o'clock: "Some Fundamental Considerations in the Determination of a Reasonable Return for Public Hydrant Service," Leonard Metcalf, Emil Kuichling, W. C. Hawley; illustrated lecture on "The Panama Canal," Dabney H. Maury.

For the Ladies—Card party in room "C," Powers Hotel, at eight o'clock in the evening. Light refreshments will be served.

Wednesday, June 7, 1911—Forenoon session (nine o'clock)—Question box: Reading of written replies to questions and general discussion of questions presented, and propounding of new questions. Eleven o'clock—Election of officers for 1911-12. Selection of place for holding 1912 convention. Afternoon session (half-past one o'clock)—Experience meeting. Presentation of short "experience papers" and general discussion of water works subjects. The following named two papers will be read and discussed: "An Emergency Intake," Dr. William P. Mason; "Wood Stave Pipe, Some Questions Answered," T. Chalkley Hatton. (This paper answers some questions in the question box.) Evening Session—The Association will be the guests of the Water Works Manufacturers' Association at a fish dinner at Manitow Beach. Special cars will leave Church street, one block from the Powers Hotel, promptly at 4.30. Dinner will be served promptly at 6 o'clock.

Thursday, June 8, 1911—Forenoon Session (nine o'clock)—"Water Rates," George G. Earl; "High Pressure Fire Service Compared with Portable Fire Engines," Charles A. Hague; "Compressed Air in Water Works Construction," Alexander Milne; "The Investigation of Underground Water Waste in Washington, D. C.," W. A. McFarland.

For the Ladies (ten o'clock)—The Entertainment Committee has provided an automobile trip, starting from the ladies' entrance to the Powers Hotel promptly at ten o'clock in the morning. Afternoon Session (half-past one o'clock)—"Steel vs. Iron Pipe," Allen Hazen; "Hot Water Problems," George C. Whipple; "Interpretation of Chemical and Bacteriological Terms Used in Water Analysis," Daniel D. Jackson; "Methods of Keeping Records of Improvements to Established Water Works Plants," Charles Carroll Brown.

Evening Session (eight o'clock)—Band concert in the Park Arena or Convention Hall.

Friday, June 9, 1911—Forenoon Session (nine o'clock)—"Water Softening by Means of Zeolith," Boris N. Simin; "Stripping Reservoir Sites," H. G. Coventry; "Sydney (Australia) Water Supply; Its History and Management," Charles Walter Smith; "Ultra-Violet Ray Sterilization," A. E. Valden. Reading of papers not announced and a general discussion of water works subjects. Unfinished business. Installation of officers for 1911-12. Afternoon Session (quarter-past two o'clock)—By invitation of the Water Works Manufacturers' Association, Special Water Works Matinee at the Lyceum Theatre. Probable play, "The Great Divide." Evening Session—Will be announced later.

National Association of Comptrollers and Accounting Officers.—At the last session of the association it was voted to hold the next annual convention in Birmingham, Ala., but owing to reasons which appear to be ample and sufficient it has been decided to meet this year in Washington, D. C., the dates selected being June 8, 9 and 10. The meeting place will be the Arlington Hotel, and the first session will open promptly at 10 o'clock on Thursday morning, June 8. Secretary Rex advises members to be in Washington the morning before in order to make acquaintances before the sessions begin. The programme is one of the best that the association has had, and in addition to this, President Tweedale states that other speakers than those mentioned will doubtless address the convention.

The matter of uniform budgets for cities is one of exceedingly great importance, and it has been decided to set apart a portion of one of the sessions to a discussion of this matter, and members of State boards and those having this matter in charge have been invited to be present and address the convention.

The entertainment feature has not as yet been fully developed, but it is anticipated that a banquet will be given at the Arlington on the evening of the second day of the convention.

The President of the United States has signified his willingness and pleasure to receive the members of this association at the White House on the afternoon of Friday, June 9, at 2:30 o'clock.

The programme follows:

The Philadelphia Balance Sheet, John M. Walton, Comptroller, Philadelphia, Pa.

Financial Statements of Municipalities, with Special Reference to the Balance Sheet contained in the last Annual Report of the Comptroller of Philadelphia, Dr. Frederick A. Cleveland, Chairman of the President's Economy and Efficiency Commission.

Financial Statements of Municipalities—Balance Sheets, Edward Stetson Griffing, Comptroller, New Rochelle, N. Y.

The Capital Account of a City, Howard C. Beck, C. P. A., President of The Detroit Audit Company.

The Necessity of the Budget from the Legislative Viewpoint, Hon. Swagar Sherley, of Kentucky.

The Essentials of a Good Budget, Dr. Le Grand Powers, Chief Statistician, Census Bureau, Washington, D. C.

Standardization, Edmund D. Fisher, Deputy Comptroller, New York City, N. Y.

The Back Tax Problem, William G. Justice, Comptroller, Buffalo, N. Y.

What Detroit Does with Back Taxes, David E. Heineman, Detroit.

The Duties of a Comptroller Under a Commission Form of Government, W. H. Farnham, Comptroller, St. Paul, Minn.

Financial Statements of Municipalities—Balance Sheets, Duncan MacInnes, Chief Accountant, New York City.

In addition to the foregoing list of speakers who have accepted, the Hon. Henry E. Turner, Auditor of the State of Massachusetts, has been requested to address the association on the subject of "Financial Statements of Municipalities," and the Hon. Henry George, Jr., Representative from the State of New York, has promised, in case his official duties do not interfere, to make an address on the subject of "Taxation." A number of other subjects are under contemplation, and therefore this programme is simply tentative.

South Carolina Water Works Association.—The following notice has been sent to prospective members: "The South Carolina Water Works Association will be organized on June 28 at Columbia. The undersigned have selected this date in order that delegates to the convention may avail themselves of the opportunity of securing reduced railroad rates, as the South Carolina Firemen's Association will meet during the same week. The following fees have been agreed upon subject to the approval of the convention: Fees for active and associate members, \$2; annual dues, active members, \$2; annual dues, associate members, \$1. Those eligible to active membership are City Council members of Committees on Water Works and officials of Water Works Departments. Those eligible to associate membership are Mayors and City Councilmen. We request you to co-operate with us in every way possible to make our organization successful and useful. Please call upon those in your city who are eligible to active or associate membership and secure their pledge to join. Printed programmes will be sent out one week in advance of the meeting. A good attendance at our first meeting will place the organization on a solid foundation and be a guarantee for usefulness and service to our respective communities. The city officials should be vitally interested in this movement, and the Water Works Department officials are urged to enlist them in the work of perfecting our organization. For further information write W. F. Stieglitz, Columbia, S. C. Signed: W. F. Stieglitz, Columbia; R. A. Easterling, Union, J. G. Barnwell, Yorkville, H. M. Banks, St. Matthews; C. M. McClure, Anderson; A. J. Sproles, Greenwood.

American Institute of Electrical Engineers.—Unusual interest is taken in the forthcoming annual convention of the American Institute of Electrical Engineers, for it will be held in Chicago on June 26 to 30, inclusive, and it has been many years since the convention met in that city, although the electrical attractions of Chicago and vicinity are exceptional in interest and variety. Among these points of interest may be mentioned the Ryerson Physical Laboratory of the University of Chicago, where the atomic theory of electricity has been demonstrated by most interesting experiments; the electric furnaces in the steel mills at South Chicago; the enormous electric plant at the Gary, Ind., steel works, driven by gas engines; the great central stations of Chicago, famous for their size and modern design; the hydroelectric development of the Chicago Drainage Canal; "Underground Chicago," with its network of electrically operated freight tunnels; the latest large automatic telephone system; several of the largest manually operated telephone exchanges in the world; street railway and other substations of unusual interest; possibly the largest street railway shops in the world, with electric drive throughout, and many other notable electrical applications.

The convention will meet in the new Hotel Sherman, the most recently completed of Chicago's group of modern hotels. The sessions will be held in the handsome Louis XVI room, which will seat 700 people and can be connected with adjoining apartments to seat 1,500 if desired. Every room in this hotel is provided with bath, and the rates are very reasonable. The restaurants in the hotel, including the

well-known College Inn, have a wide reputation.

A committee of fourteen local members of the Institute has been appointed to make the arrangements for the convention. Mr. Louis A. Ferguson, 120 West Adams street, Chicago, is the chairman of this committee. The program will include visits to points of interest and various social events, and it is confidently expected that the 1911 convention of the Institute will be the most successful in its history.

The following are among the papers to be presented: "Economic Design of Direct Current Magnets," by R. Wikander; "Catenary Span Calculations," by W. L. R. Robertson; "Currents in Inductors of Induction Motors," by H. Weichsel; "Multiplex Telephony and Telegraphy by Means of Electric Waves Guided by Wires," by Major G. O. Squier; "Electrolysis in Reinforced Concrete," by C. E. Magnusson; "Induction Motor Design," by T. Hoock; "The High Efficiency Suspension Insulators," by A. O. Austin; "The Electric Strength of Air," by J. B. Whitehead.

International Association of Fire Engineers.—The annual meeting will be held in Milwaukee, Wis., September 19 and 22, in a large and commodious hall. The Auditorium has been secured for the meetings and the exhibits all under one roof. Application for space should be made to Chief Thomas A. Clancy, Milwaukee, Wis. The Plankinton House has been selected as headquarters.

The following subjects have been selected for discussion:

1. A College for the Purpose of Educating and Perfecting Firemen in Their Various Duties—Edward F. Croker, ex-Chief, New York.

2. Fire Prevention by Education Rather Than Legislation—H. C. Henley, Superintendent Fire Prevention Bureau, St. Louis, Mo., and A. V. Bennett, Chief Fire Department, Birmingham, Ala.

3. Motor Fire Apparatus—Electricaly Propelled—W. H. Daggett, Chief, Springfield, Mass.

4. Motor Fire Apparatus—Gas Engine Propelled—Thomas Ballantyne, Chief, Savannah, Ga., and Arthur Aungst, Chief, Alliance, Ohio.

5. The Calibre of Fire Streams and a New Method of Determining Their Value—Charles H. Fox, Ahrens-Fox Fire Engine Company, Cincinnati, Ohio.

6. Compulsory Sprinkling of Basements—W. H. Loller, Chief, Youngstown, Ohio.

7. The Duties of State Vice-Presidents to the International Association of Fire Chiefs—J. Q. Hawk, Chief, Moline, Ill.

8. Rubber Tires—Solid vs. Pneumatic—Charles E. Swingley, Chief, St. Louis, Mo.

9. The Best Method of Selecting Hose for Fire Department Purposes—Harry L. Cremer, 87 Washington street, Chicago.

10. The Equipment and Efficiency of the Volunteer Fire Services—J. F. Runyan, Chief, Morristown, N. J.

11. Standards of Drill and Discipline for Fire Departments—T. F. Owens, Chief, Denver, Col.

The International Municipal Congress and Exposition has invited the members of the association to visit the exposition, and will charter a steamer to transport them from Milwaukee to Chicago.

Calendar of Meetings

May 23-26.

National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.

May 25-26.

League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.

May 29-June 2.

National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.

June 5-14.

National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.

June 6-8.

Engineers' Society of Pennsylvania.—Annual Meeting at State College, Pa.—E. R. Dasher, Secy., P. O. Box 704, Harrisburg, Pa.

June 6-10.

American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.

June 7-14.

National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.

June 7.

National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.

June 8-10.

National Association of Comptrollers and Accounting Officers.—Annual Convention, Arlington Hotel, Washington, D. C.—George M. Rex, Secretary, 525 Industrial Trust Building, Providence, R. I.

June 11-16.

International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.

June 13-18.

New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.

June 13-16.

American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.

June 21-22.

National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.

June 22-24.

Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.

August 15-18.

Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.

September 12-15.

International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.

September 18-30.

International Municipal Congress and Exposition.—Chicago, Ill.—Curb W. Treab, Secretary, Great Northern Building, Chicago, Ill.

September 19-22.

International Association of Fire Engineers.—Annual Convention, The Auditorium, Milwaukee, Wis.—James McFall, Secretary, Roanoke, Va.

September 19-22.

American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.

September 24-30.

International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.

September 26-29.

American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.

October 4-6.

League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

November 13-17.

National Municipal League.—Annual Meeting, Richmond, Va.—Clinton Rogers Woodruff, Secretary, North American Building, Philadelphia, Pa.

PERSONALS

ADAMS, ALTON D., of Worcester, Mass., has been engaged by the city of Racine, Wis., as an expert engineer to assist the city attorney in the prosecution of the water works case.

ARNOLD, CHARLES C., is again mayor of East Peoria, Ill., as he was successful in his suit to contest the seat of John T. Keil, who was declared elected at the election held in April. At the time of the election, the election judges decided that Keil was elected by a majority of three votes, 134 to 131, but 11 ballots were thrown out as being defective, and the contest was over these, Mr. Arnold contending they had been cast for him and should have been counted.

BROWN, P. L., has been elected Mayor of Silverton, Oregon.

CALLAGHAN, BRYAN, was re-elected Mayor of San Antonio, Texas.

CHILDS, WM. T., has been appointed deputy city comptroller of Baltimore, succeeding Julius W. Freeman, who had held the position for fifteen years.

CROZIER, A. J., has been elected Mayor of Salina, Utah, to fill the vacancy caused by the death of H. F. Jorgensen.

EDYVEAN, EDMUND H., has been appointed road engineer of Iron County, Mich.

FISHER, LEWIS, was re-elected Mayor of Galveston, Texas.

GINDORF, F. C., was elected Mayor of Sidney, Iowa, and then qualified as deputy county sheriff. The Attorney General has decided he cannot hold both offices. He rules that a mayor, being ex-officio a justice of the peace, is a judicial officer and that a deputy sheriff is an executive office and that one person cannot hold both offices at one and the same time.

RALPH, GEORGE E., Minnesota's state drainage engineer, is taking a ten-day trip over the eastern part of the State investigating the progress of field and construction work.

ROOT, WM. T., Sr., city councilman of Pasadena, Cal., for six years and recently elected to serve two years more, has been elected president of the council.

STEINERT, ALEXANDER, has been named by Mayor Fitzgerald as a member of the Boston municipal art commission.

THOMPSON, S. A., field secretary of the National Rivers and Harbors Congress, is making a tour of the Southern States in an effort to arouse interest in deep waterways.

TIPTON, A. H., has been elected mayor of Elizabethton, Tenn.

WILLIAMS, PROF. GARDNER S., of the University of Michigan, presented a paper at a meeting of the hydraulic, sanitary and municipal section of the Western Society of Engineers, Chicago, on May 17, on the subject of "The Measurement of Water, Means Available and Their Relative Accuracy."

WEBER, WALTER H., is the new mayor of Havre de Grace, Md.

WESTON, ROBERT SPURR, of Boston, lectured on the general subject of sewage disposal before a meeting of the eastern section of the American Chemical Society at Union College, Schenectady, last week. Mr. Weston is a sanitary expert and formerly consulting engineer of the Massachusetts State Board of Health.

WHIPPLE, GEORGE CHANDLER, of New York, has been appointed Professor of Sanitary Engineering at Harvard University and will begin his work there next fall. Mr. Whipple is one of the most eminent engineers in the country. He was graduated in 1889 from the Massachusetts Institute of Technology.

INDUSTRIAL NEWS

Cast-Iron Pipe.—Although recent lettings have been small the condition of the market is considered as satisfactory. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. San Francisco: The tonnage booked is satisfactory and several large inquiries are in the market. Birmingham: Some fair contracts have been closed; there is little expectation of any material reduction in the output for several months. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, average, \$21. New York: The inquiry for pipe has increased notably. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—The market continues weak and independents are making the price. Quotations: New York, 4.50c; St. Louis, 4.25c.

Steam Fire Engine Test.—The Ahrens steam fire engine recently purchased by the city of Janesville, Wis., was satisfactorily tested last week. With a steam pressure of 240 pounds and an 1 3/8-inch nozzle a stream was thrown about 200 feet high, which is higher than any building in Janesville.

Chemical Engine Test.—In connection with an excursion of Cincinnati business men, who stopped at Charleston, W. Va., last week, the Kanawha Chemical Fire Engine Manufacturing Company gave a demonstration of the ability of their apparatus to put out a fire. A shack about 16 feet square, open on one side and with large openings at the top for draught, was built on a lot. The structure was filled with dry wood, covered with excelsior and just before the demonstration was begun 10 gallons of coal oil and five gallons of gasoline were thrown on the contents, making the subject of the test as highly inflammable as possible. An alarm was then turned in and a match applied. Within a few seconds the entire pile of material was a roaring furnace and spectators were forced to retreat. The entire Fire Department responded and made the run from Central Station in two minutes. When they arrived on the scene the fire was burning fiercely. Mr. Harlan, representative of the chemical company, directed a stream of the chemical from the chemical wagon used by the Fire Department on the blaze, but the flames ad secured such headway, and as the building was so constructed that nothing in the fire fighting line could stop such a big blaze, the demonstration, to the casual observer, seemed to fall short of its aim. The efficiency of the chemical itself, however, was clearly demonstrated, as the blazing portion of the structure reached by the force of the stream was extinguished instantaneously.

Water Company.—Officials of the Girard Water Company, Girard, O., met with members of Village Council for the purpose of discussing the schedule of rates in the water franchise over which there had been some complaint. After a thorough discussion and investigation of the subject Council decided that the water company was entirely within its rights in making the charges which had been complained of. Upon investigation members of Council discovered that the water rates for Girard are no higher and in many cases less than over 40 towns in this section of the country.

New Cause of Sewer Clogging.—According to reports submitted to Mayor Simon sewers in streets in Portland, Ore., where Hassam pavement has been laid are becoming clogged partly from cement grout which runs into the sewers during the construction of the pavement and partly from washings of cement from the pavement after it has been laid. When the Hassam pavement is laid the rock which forms the base of the pavement is rolled and flushed with cement to thoroughly grout it. As it is being grouted the pavement is rolled again, causing a foam to form in which there is a large amount of cement. This is washed from the pavement into the catch-basins, where much of it is caught, but a portion of it finds its way into the sewers, where it is deposited on the sides and bottoms of the sewers, where it hardens into a substance resembling lime rock. It is also said that the wear upon the pavement loosens particles of the cement, which is washed into the sewers when the streets are flushed by the street cleaners, and these minute particles also form and harden into the lime-like substance. Sewers in which this deposit is said to be found more largely are located in the Holladay Addition and on East Twentieth street. The Multnomah sewer is said to be seriously affected. During the last two years many miles of Hassam pavement have been laid in the city, and about 20 additional miles are projected.

Sewer Pipe.—Representatives of the Akron Sewer Pipe interests were in conference last week with representatives of manufacturers from other sections of the country for the purpose of discussing matters of interest to the sewer pipe trade.

Paving Plant Burned.—Fire gave the firemen a fight of several hours May 12 at the Standard Bitulithic Company's plant at the foot of Essex street, Harrison, N. J. The blaze destroyed the frame building occupied by the concern. The blaze was caused by the boiling over of a pot of asphalt. When the fire started there were between 30 and 40 employees at work, a day and night force being employed at the plant. With the firemen the employees worked hard to try and put the fire out, but the best they could do was to save the adjacent buildings.

Corrugated Culverts.—The California Corrugated Culvert Company, Berkeley, Cal., expects to make a large addition to its factory this summer.

Cement.—The Canada Cement Company has purchased a site of 100 acres near Winnipeg, on which it intends to place a cement-grinding plant to cost \$400,000.

Municipal Auto Truck.—The Eclipse Truck Company, Franklin, Pa., has placed on the market an auto truck specially designed for the use of city departments. Last week Mayor Francis M. Graff, Superintendent of the Water and Light Department Harry W. Ellsworth and City Clerk Fred Kiebert, of Meadville, inspected the truck and looked over the plant of the company. The city of Meadville is considering the purchase of a truck for the Water Department. The Meadville officials were favorably impressed with the Eclipse truck, and it is likely that an order will be placed for one.

Record Run.—The new 80-horse-power automobile combination chemical engine and hose wagon purchased from the Seagrave Company, of Columbus, O., was given its official test by Fire Chief A. H. Myers, accompanied by Commissioners Hayden, Coates, Fairley and Fassett, Spokane, Wash. It was accepted by Commissioner Hayden and Chief Myers ordered it placed in service at No. 4 fire station. The route selected by Chief Myers for the test was most difficult. The start was made from Police Headquarters. At Fourth avenue and Monroe street it was stopped. At a signal from Chief Myers the engine was started and the Monroe street hill, south from Fourth avenue to Ninth, was made in 1 minute and 14 seconds. The Monroe street hill has a 17 per cent grade. From there a run was made out South Lincoln to Twenty-fifth avenue, returning to Ninth avenue, east to Grand avenue, then south on Grand avenue to Thirty-second avenue, back to Sprague and then to the City Hall; in all a total distance of 10 1/2 miles. Going east on Sprague avenue the machine was given its test for speed, when it maintained 40 miles an hour. This new piece of fire fighting apparatus is one of the latest models manufactured and carries 2,000 feet of fire hose with a partition in the center of the hose body, thus permitting two leads to be laid off on arrival at the fire. It also carries a 40-gallon chemical engine with 250 feet of chemical hose. The motor is an air-cooled six-cylinder, with auxiliary exhausts.

Incinerators.—The McCall Incinerator Company of North America, Memphis, Tenn., has issued several circulars describing and illustrating different types of incinerators for the disposal of excreta and other wastes of construction and permanent or semi-permanent camps.

Fire Crusher.—The Gardner Crusher Company, 556 West Thirty-fourth street, New York, has issued a pamphlet describing and illustrating its crushers. Seventy-three materials are enumerated which the crusher is suitable for handling; these vary in character and hardness all the way from sugar to corundum. One of the illustrations shows the breaking and grinding process which takes place in the machine and the position which the material being handled assumes.

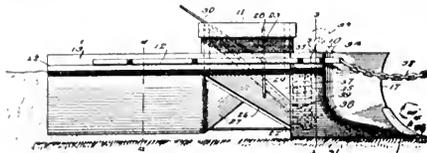

Pipe Coating.—The American Asphaltum and Rubber Company, 600-614 Harvester Building, Chicago, Ill., is sending out a card regarding its mineral rubber pipe coating. The card has an illustration of a 36-inch steel pipe coated with mineral rubber, at Montreal, Canada; also a 3,000,000-gallon reservoir water-proofed with Pioneer reservoir water-proofing at Muskogee, Okla.

Scales for Water Works.—The Standard Scale and Supply Company, of Pittsburg, has secured a large contract for scales to be installed at the various pumping plants of the Department of Water Supply, Gas and Electricity, Borough of Brooklyn, N. Y. These scales aggregate thirty-five in number, and include several hundred-ton 42-foot railroad track scales, both pit and suspension pattern, and a large number of wagon scales of 10-ton capacity, heavy railroad pattern. All these scales are to be built in steel and concrete construction. The contract will be completed during the summer. This is one of the largest installations of high capacity scales ever made.

PATENT CLAIMS

992,649. CONCRETE-SPREADER FOR DITCHES, SIDEWALKS, AND OTHER SURFACES. George W. Gale, Greeley, Colo. Serial No. 598,234.

A mortar or concrete spreading apparatus comprising a frame, a hopper for the reception of the plastic material, inclined

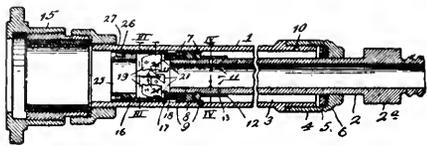

plates spaced apart in the rear of said hopper, and an agitator in said hopper movable against the inclined bottom thereof.

990,417. FORM FOR MOLDED CONDUITS. Henry W. Bassett, Seattle, Wash. Serial No. 550,247.

An inner form for molded conduits comprising longitudinal segments adapted to outline the invert, other longitudinal segments adapted to outline the remainder of the conduit, a restraining band adapted to surround and locate said segments and having its inner edge recessed to hold the invert segments enough farther from the center than the segments adjoining to permit the edges of the latter moving peripherally within the invert segments, and means for peripherally expanding those segments above the invert.

992,314. HOSE-NOZZLE. Francis Wheatley, Kansas City, Mo. Serial No. 542,556.

A hose-nozzle consisting of an outer tubular section and a tubular piston section, which latter is slidably mounted in

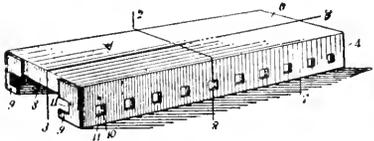

the former and of sufficiently less diameter to form a chamber having communication with the interior of said piston.

992,313. PROCESS OF MANUFACTURING WATERY SOLUTIONS OF OILS, FATS, TAR, ASPHALT, &c. Leonard Schade van Westrum, Berlin, Germany, assignor to Westrumite Company of America, Chicago, Ill., a Corporation of Maine. Serial No. 288,855. Renewed July 13, 1907. Serial No. 383,626.

The process of manufacturing watery solutions of substances which are not naturally soluble or emulsifiable in water which consists in mixing said substances while heated with a saponifiable oil, adding water and a volatile alkali and agitating the mixture.

992,573. ARMORED PAVING. Peter P. McMenamin, Jersey City, N. J. Serial No. 532,368.

A block, composed of a single sheet of metal bent to form top, sides and ends, said sides having flanges bent to overlap

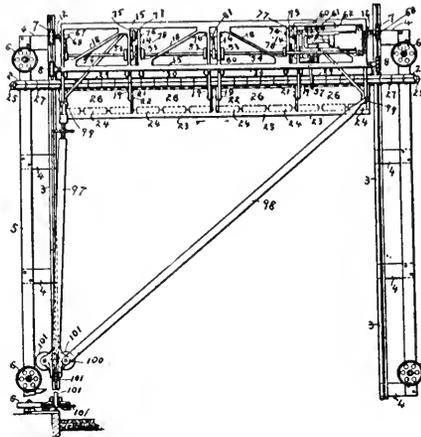

said ends, and said sides and flanges also having tongues struck inwardly from the body thereof to form concrete engaging members and also to form communicating apertures between the interior and the exterior of the block.

992,279. PRESSURE-OPERATED GAS LIGHTING AND EXTINGUISHING APPARATUS. Ernest Sparks, London, Eng. Serial No. 575,497.

A pressure operated gas lighting and extinguishing apparatus comprising a piston mounted in a cylinder, a gas cock passing laterally through the wall of the cylinder and interposed in a straightway gas pipe, a spindle mounted in said gas cock and adapted to project over the said piston, a ratchet wheel at one end of said spindle and a cam wheel at the other end of the spindle, said ratchet wheel adapted to be engaged and rotated by a pawl mounted in a bracket carried by said piston, said cam wheel having half the number of teeth of the ratchet wheel and adapted to raise from its seat a coned plug in the gas cock casing and in the line of the straightway gas pipe.

992,538. APPARATUS FOR AND PROCESS OF LAYING PAVING MATERIAL. William Bayley, Springfield, Ohio. Serial No. 488,107.

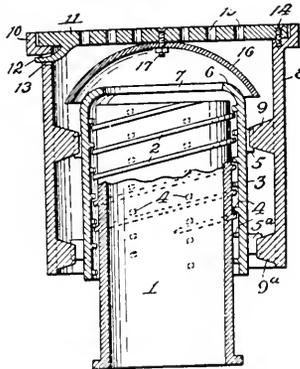

In a paving apparatus, a bridge-like main frame supportable at the sides of the paving-bed and movable relatively to and

over the paving-bed, means carried by said frame to receive and hold the paving blocks and positive means to cause the blocks to move thence into paving position.

992,377. SEWER VENT-BOX. Thomas P. Moore, Reading, Pa., assignor to Abraham Lincoln Frame, Reading, Pa. Serial No. 611,746.

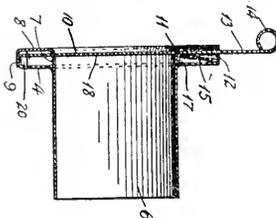

In a vent box for sewers, the combination with a sewer pipe connection threaded externally, an inner casing formed with an inwardly flanged upper end, internal buttons arranged to engage the convolutions of the thread on the pipe connection and four pairs of diametrically opposite lugs on its outer surface, of an outer casing

formed with registering lugs adapted to enter the spaces between the pairs of lugs on the inner casing, a perforated cover plate for the outer casing, said plate having a locking tongue adapted to engage the casing and means for securing the cover plate to the casing, and a dome secured to cover the upper open end of the inner casing.

992,293. FLUME-GATE. Elmer O. Thomason, Covina, Cal., assignor to Kellar-Thomason Manufacturing Company, Covina, Cal., a Corporation of California. Serial No. 584,490.

A gate having a seat, a slide coming upon said seat and a member having a

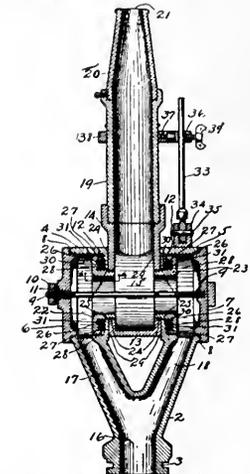

projecting lip pressing said slide and holding the same upon said seat, said lip following the outline of said seat.

991,434. WOOD-PRESERVING COMPOSITION. Carleton Ellis, Montclair, N. J., assignor to Copper Oil Products Company, a Corporation of New York. Serial No. 582,989.

A wood preserving composition, comprising copper gyaulate and oleate in solution in heavy asphaltic oil.

992,193. NOZZLE. Milton H. Hart, Akron, O. Serial No. 593,133.

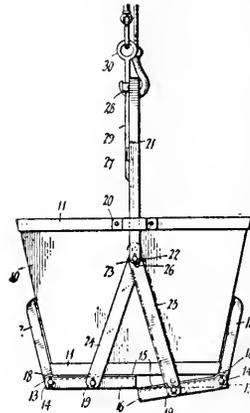

The combination with a bifurcated supply-pipe, and an adjustable nozzle-piece disposed concentrically between flanged portions of the branches of said pipe, of a pair of cylindrical bushings threaded into said nozzle-piece, each bushing having an external flange arranged to form an annular

groove facing the flange of said supply-pipe, corrugated seats formed in the flanged portions of the supply-pipe, corrugated seats formed in the grooves of said bushings, and a compressible packing disposed between said corrugated seats for preventing the leaking of the device.

992,724. CONCRETE-BUCKET. Willard D. Lockwood, Schenectady, N. Y. Serial No. 466,882. Renewed Apr. 18, 1910. Serial No. 556,259.

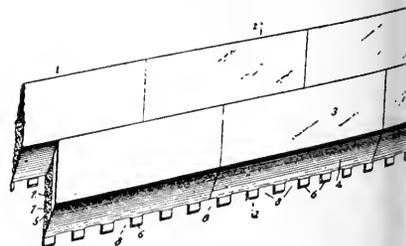

In a hoisting bucket, a body comprising side and end walls, doors hinged to said body and provided with hinge edges formed

to constantly contact with the edges of the wall to which they are attached, and links connected to said doors and arranged to close one of said doors before the other is closed.

992,574. INTERLOCKING ARMORED PAVING. Peter P. McMenamin, Jersey City, N. J. Filed Aug. 3, 1910. Serial No. 575,256.

A paving block comprising a cementitious filling and an armored covering, said armored covering comprising a single sheet of metal stamped up to form a top, sides and ends, said sides having incisions in the lower edges thereof, forming tabs, each alternate tab being bent inwardly to

form retaining members adapted to maintain said filling within said covering, and the remainder of said tabs being bent outwardly to form interlocking members which dovetail with the corresponding members on the juxtaposed blocks so as to prevent longitudinal and vertical movement of said block relative to adjacent blocks.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Ohio	Youngstown	May 26	Grading and paving various streets	City Clerk.
New York	Buffalo	May 26, 11 a.m.	Paving, masonry and other work necessary for constructing the subways and approaches in Elmwood ave. under tracks of N. Y. Central	Geo. N. Norton, Deputy Engr. Com. J. J. & W. W. Cox, Engrs.
Michigan	Coldwater	May 26	Constr. 6 miles of road in Branch County	
Pennsylvania	Bellevue	May 26, 6 p.m.	Improving portion of Brighton and Lincoln ave., consisting of 700 cu. yds. grading, 4,400 ft. curbing, 13,650 sq. yds. paving	John McBride, Boro. Engr.
Utah	Salt Lake	May 26	Constructing cement walks in sidewalk extension No. 129	H. G. McMillan, Clk. Bd. Pub. Wks.
Ohio	Cleveland	May 27, 11 a.m.	Grad. drain and improve Irish Road No. 2 and Harvard Road	John F. Goldenbogen, Clk. Bd. C. C. J.
Indiana	Greencastle	May 27, 2 p.m.	Constr. 8,275 lin. ft. macadam road in Russel township	D. V. Moffitt, County Auditor.
Pennsylvania	Eric	May 29, 8 p.m.	Paving various streets	City Clerk.
Ohio	Toledo	May 29, 10 a.m.	Furn. macadam and other materials for repair of all imp. roads	Chas. J. Sanzenbacher, Co. Aud.
Virginia	Amherst	May 29, 11 a.m.	Constr. about 4½ miles of macadam road, alternate bids with County owning 5,000 cu. yds. stone and a 10-ton roller and sprinkler and contractor furn. roller and sprinkler	P. St. J. Wilson, St. Hwy. Comr. P. B. Bowler, Street Comr.
New Jersey	Morristown	May 29	Paving various streets	
Minnesota	Minneapolis	May 29	Repairing and resurfacing Road No. 41 and graveling parts of Roads 47 and 74 in town of Plymouth and No. 8 in town of Hassam	A. P. Erickson, County Engr.
Sask., Can.	Moose Jaw	May 29, 8:30 p.m.	Laying about 41,093 sq. yds. pavement; 206,061 sq. ft. concrete sidewalks; 46,366 lin. ft. curb and gutter; 1,056 sq. yds. wood block crossing	J. M. Wilson, City Engr.
Illinois	Mt. Carmel	May 30, 2 p.m.	Constr. 15,725 sq. yds. vit. brick pavement, concrete foundation, cement filler, concrete curb and gut. Est. about \$42,000.	T. B. Wright, Jr., Mayor.
Pennsylvania	Scottdale	May 31, 8 p.m.	Grading, curbing and paving various streets, about 6,734 sq. yds., with vitrified brick or block; also paving with vitrified hillside brick or block 1,824 sq. yds.	R. F. Ellis, Burgess.
New York	Brooklyn	May 31	Repaving with iron slag about 2,915 sq. yds.; and with asphalt 21,245 sq. yds. Furn. 200,000 gals. asphalt road oil and 3,000 bbls. Portland cement	Alfred E. Steers, Boro. Pres. W. J. Williams, Boro. Secy.
Pennsylvania	Wilkes Barre	May 31	Constr. 6,060 sq. yds. paving; and 3,500 lin. ft. curbing	W. J. Williams, Boro. Secy.
Pennsylvania	Kingston	May 31, noon	Constr. 10,000 sq. yds. brick paving on concrete foundation; 3,000 sq. yds. Warrenite or similar paving	W. J. Williams, Boro. Secy.
Ohio	Columbus	June 1, noon	Grading and mac. .88 mile of road in Hocking County; est. cost \$5,073.80.	Jas. C. Wonders, State Hwy. Comr. The George Company, Ran. Bldg Memphis, Tenn.
Mississippi	Hazlehurst	June 1	Constructing 58 miles of gravel roads in Copiah County	
New Jersey	New Brunswick	June 1	Completing by macadamizing and otherwise improving Franklin Park and Kingston road	Asher Bisset, Clk. Bd. Co. Comrs Ora E. Lauber, Village Clerk.
Ohio	Archbold	June 2	Imp. Defiance st., by grad. drain, curbing and paving	H. C. Hill, State Engr.
New Hampshire	Concord	June 2, 1 p.m.	Furn. trap rock, estimated about \$4,500	F. Driehs, Clk. Bd. Co. Comrs.
Ohio	Cincinnati	June 2	Improving Crookshank Road in Green township	Sam'l L. Burgess, Township Clerk City Clerk.

Lafayette, La.—Mayor A. R. Trahan has recommended need of sewerage system.

Lake Charles, La.—Bids are being asked for the construction of system in Sewerage District No. 1 to cost approximately \$150,000.—W. G. Kirkpatrick, Jackson, Miss., Engineer; T. H. Mandell, City Engineer.

Baltimore, Md.—Calvin W. Hendrick, Chief Engineer Sewerage Commission, American Bldg., is completing plans for sewers in bed of Jones Falls between Union Station and water front; cost, \$160,000.

New Bedford, Mass.—Council has concurred with Aldermen in orders appropriating \$1,100 for sewer in Sisson st., from Arnold to Union; \$2,400 for sewer in Arnold st., from Rotch to Sisson; \$12,000 for extension of Grape st. trunk sewer in Reed and Union sts. and Rockdale ave., and \$2,000 for sewer on Lake and Hussey sts.

Duluth, Minn.—Cost of constructing sanitary sewer in three alleys near Grand ave. has been estimated at about \$6,000.

Proctor, Minn.—Citizens will vote on \$25,000 bonds for sewers.

Libby, Mont.—Citizens will soon vote on \$20,000 bonds to install \$15,000 sewer system and make other improvements.

Trenton, N. J.—Council is considering ordinance for issuance of \$10,000 bonds to cover preliminary work necessary to establishment of sewage disposal plant; also passed ordinances for constructing sewers in four streets.—H. B. Salter, City Clerk.

Albany, N. Y.—Council has passed ordinance for construction of intercepting sewer; \$400,000 bonds will be issued.

Buffalo, N. Y.—Mayor Fuhrmann has signed notice of intention for system of trunk and other sewers which it is estimated will cost about \$1,000,000.

Herkimer, N. Y.—Board of Trustees will consider election on raising \$25,000 to build sewers.

Poughkeepsie, N. Y.—Council has ordered construction of sewer in Davis st.

Owasso, Okla.—City has decided to construct sewer mains at cost of \$20,000.

Oregon City, Ore.—Council will sell bonds for sewer work in Dist. No. 6.

Pendleton, Ore.—Citizens have voted to extend sewer system for one mile.

Roseburg, Ore.—Bids will be received until about June 1 for extension of sewer system at cost of \$20,000.—M. B. Gormond, Engineer.

McKeesport, Pa.—City Engineer J. Monroe Smith has submitted to Chief Engineer Snow, of the State Health Department, plans for proposed sewage systems of Eighth, Ninth and Eleventh Wards.

North York, Pa.—Town Council is considering installation of sewer on Eighth ave.—E. M. Bare, Chairman Highway Committee.

Pittsburg, Pa.—All bids for constructing portion of sewer system in Try st. drainage basin have been rejected; new bids will be called for.

Sharon, Pa.—Trimble & Miller, Pittsburg, are preparing preliminary plans for sewage disposal plant.

West Chester, Pa.—Council has adopted plans for proposed sewer system with outfall mains; bids will be asked at once.

Blacksburg, Va.—Citizens have voted \$12,000 bonds for installation of sewerage and water system.

Pomeroy, Wash.—Engineer M. K. Spider, Pullman, will prepare survey and estimate of cost of constructing \$25,000 sewerage system.

Morgantown, W. Va.—Council has decided to hold election on \$40,000 for installation of sewers.

Ingersoll, Ont., Can.—Board of Health has recommended installation of sewerage system.

Neepawa, Man., Can.—Town has selected Chipman & Power, Toronto, Ont., to prepare plans for construction of sewerage and water works system at cost of \$125,000.

CONTRACTS AWARDED

Austin, Minn.—Building sewers on several streets, to J. W. Turner & Co., Des Moines, Ia., about \$5,769.

Dansville, N. Y.—Construction of extension of surface water sewer system, to the lowest bidder, H. C. Schroeder, Rochester, \$2,000; James M. O'Hara, Dansville, bid \$2,407.75, and Kern & Miller, Dansville, \$2,327.12.

Old Forge, N. Y.—Putting sewer through the main street, to the Old Forge Hardware and Furniture Co., \$1,475.

Rochester, N. Y.—Building Humboldt st. sewer, to John Petrossi Co., \$12,531.

Ironton, O.—Building storm sewer in Richell Creek and Cedar Alley, to M. A. Mulligan, city, \$13,859.

Xenia, O.—By County Commissioners for sewage purification plant for Children's Home, to Huonker & Williams, Springfield, \$1,310; for the sewage purification plant for Infirmary, also to same firm, \$1,500.—A. Elliott Kimberly, Columbus, Sanitary Engineer.

WATER SUPPLY

Hot Springs, Ariz.—Fire Chief Blevius has recommended installation of larger mains and additional fire plugs.

Oxnard, Cal.—Board of City Trustees has ordered plans and estimates prepared for water works and also for paving of all streets.—S. G. Bennett, City Engineer.

Vallejo, Cal.—Bids will be readvertised for construction of proposed 13,000,000-gal. storage reservoir; \$35,000 available.

Arcadia, Fla.—Citizens have voted \$20,000 bonds for water works extension.

Ocala, Fla.—Citizens have voted \$100,000 bonds to install water works system.

Claxton, Ga.—Council is considering proposition submitted by capitalists for construction of water works and electric light plant.

Cornelia, Ga.—Citizens have voted \$5,000 bonds for water works and sewer system.

Anna, Ill.—Council has passed ordinance providing for the laying of distributing mains totaling 23,347 ft.; total cost, including fire hydrants, valves and valve boxes, \$20,608.

Canton, Ill.—City is considering construction of water works system.

Carthage, Ill.—City proposes to procure new water supply.—J. J. Welch, Mayor.

New Athens, Ill.—Bids will be received in about 60 days for construction of water works system at a cost of \$35,000.—C. G. Redinger, Chemical Bldg., St. Louis, Mo., Engineer; A. Loos, City Clerk.

Lafayette, Ind.—City is considering installation of system of driven wells, with capacity of 7,000,000 gals. in 24 hours.—J. E. Camardy, Superintendent Water Works.

Leesburg, Ind.—Town Board is considering construction of water works; cost about \$8,000.—Jacob Whitecather, Town Clerk.

Goose Lake, Ia.—City proposes to construct water works at cost of \$3,000.—H. Thiessen, Mayor.

Lafayette, La.—Mayor A. R. Trahan has recommended need of city market and abatement of dust nuisance.

Topsham, Me.—Trustees of the Brunswick & Topsham have voted to have plans and specifications prepared for the construction of large reservoir on Sprague's Hill.

Cumberland, Md.—Citizens have voted \$500,000 bond issue for water works; water to be taken from Eviitt's Creek.

Lynn, Mass.—Council has authorized \$75,000 bond issue for construction of two pumping stations, one at Montrose and the other at east end of Glen Lewis section of Walden Pond, laying of 5,100 ft. of 36-in. pipe from Glen Lewis Pond to Breed's Pond, and preparation of plans for raising Breed's Pond to a height of 51 ft.

South Dighton, Mass.—Citizens have voted \$10,000 bonds for water supply system.—Julius G. Romers, Chairman Water Committee.

Clara City, Minn.—Citizens have voted \$10,000 bonds for construction of water works.

Biloxi, Miss.—Citizens will soon vote on \$70,000 bonds for water works improvements and extensions.

Concord, N. H.—Fire Department Committee of city government and officials of Concord water department are considering advisability of extending high pressure water supply to hydrants in West Concord other than those which are situated on State st.

Bridgeton, N. J.—Bids will be at once asked for erection of pumping and filtration plant; supply will be taken from lakes of City Park property.

Newark, N. J.—Work preliminary to construction of a great impounding reservoir that will reserve flow of the Wanaque River at Midvale will be begun at once by staff of engineers, under direction of Engineer Morris R. Sherrerd, of State Water Supply Commission.

Endicott, N. Y.—Extensive improvements are soon to be made at the Endicott water works plant.

Fredonia, N. Y.—Citizens have defeated proposition to issue \$20,000 bonds to improve water works.

Mexico, N. Y.—W. G. Stone, Mann Bldg., Utica, is preparing plans for construction of water works; estimated cost about \$40,000.

Niagara Falls, N. Y.—Citizens have voted \$360,000 to parallel mains of private water company at south end of city.

Bartlesville, Okla.—E. T. Archer & Co., Kansas City, Mo., have been selected as engineers for proposed water works, which will cost about \$200,000.—C. A. Lamm, Mayor.

Baker City, Ore.—Bids will be received about June 1 for construction of 43,100 lin. ft. of 18-in. concrete or wood-stave pipe for gravity water supply; cost about \$90,000.—I. W. Bailey, City Engineer.

Eugene, Ore.—Council is considering \$55,000 appropriation for betterment in water system and to help install proposed city lighting system.

Pendleton, Ore.—Citizens have voted \$200,000 bonds to construct pipe line from Thomas Hollorn Springs to city; distance 18 miles; two reservoirs are also included.

North Wales, Pa.—Citizens have voted to build up-to-date filtration plant and continued town committee on subject, to procure further data.

Greenville, Tenn.—Citizens will vote June 5 on \$65,000 bonds to construct water and electric light plant.

Lenoir City, Tenn.—Citizens will vote June 3 on bonds for water works.

McKenzie, Tenn.—Citizens have voted \$40,000 bonds for extension of water and electric light systems and street improvements.

Clarksville, Tex.—City will expend \$10,000 on water works extension and repairs; will also install 120-h.p. boiler, air compressor and settling basin.—C. E. Terry, Mayor.

Dallas, Tex.—Board of City Commissioners has given instructions to the City Secretary to advertise for bids for drilling of two and probably more additional artesian wells, to be sunk to Woodbine strata, near Turtle Creek pumping station.

Yorktown, Tex.—Citizens have voted \$6,000 bonds to extend water mains.

Cambridge, Vt.—McIntosh & Crandall, Burlington, are preparing plans for water works; cost \$18,000.—H. N. Gray, Chairman Board of Trustees.

Richmond, Va.—Council Committee on Water is considering plan calling for pumping main from reservoir to standpipe and concentrating at one place all water pumping; cost about \$20,000, of which \$14,000 has been set apart for new pumps.

Seattle, Wash.—Board of Public Works has approved specifications for pipe line and penstock for Lake Union plant.

Snohomish, Wash.—Citizens will vote June 6 on extension of water works.

Neepawa, Man., Can.—Chipman & Power, Toronto, Ont., have been engaged by town to prepare plans and specifications for construction of proposed water works and sewerage systems; estimated cost, \$125,000.

Windsor, Ont., Can.—Ratepayers will soon vote on \$50,000 bonds to extend water mains.

CONTRACTS AWARDED

Chicago, Ill.—Laying water pipe: Torrence ave., 103d st. to 110th st., to David Walsh, 6628 South Chicago ave.; Grand ave., N. 44th ave. to N. 48th ave., to Jas. H. Roche, 222 E. 31st st.

Tipton, Ia.—Drilling artesian well, to J. D. Shaw, Davenport, about \$4,000.

Holyoke, Mass.—Building dam at former storage reservoir, to Connecticut Engineering and Construction Co., Norwich, Conn., \$33,361.

Chappell, Neb.—Construction of water works and an electric light plant, to Des Moines Bridge and Iron Co., Des Moines, Ia.—W. E. Donner, Grand Island, Engineer.

Jersey City, N. J.—By Street and Water Board, to Stillman, Delehanty & Ferris for repairing break in the city's old water main under Hackensack River at foot of West Newark ave., \$40 per ft. for piling under river and \$3,000 for repairs to main.

Perth Amboy, N. J.—Construction of 21-in. main; John H. Gregory, city, bid \$26.75 per ft. for approximately 2,000 ft. of main; the Merritt & Chapman Derrick & Wrecking Co. bid \$15.92 per ft. on specifications and presented an alternate bid on other specifications for \$14.43 per ft., for approximately 2,000 ft. or a total of about \$31,840.

Rahway, N. J.—Installing 5,000,000-gal. per day pump at city water works, to the Snow Steam Pump Company, of Buffalo, N. Y., \$14,335.

Ft. H. G. Wright, N. Y.—Water system: Two pump houses, two electrically driven pumps, motors, etc., conduit and cable line to supply power, to L. B. Jacobs, Newark, Del., \$6,890, and 200,000-gal. reinforced concrete reservoir, to McHarg-Barton Co., New York City, \$11,000.

Geneva, N. Y.—Laying a 20-in. water main, to Lupfer & Remick, Buffalo, N. Y., \$10,640; other bidders: Thomas Fitzgerald, Fredonia, \$10,909; John D. Kuhn, Greensburg, Pa., \$13,741; D. D. Dugan, Olean, \$14,830; Henry W. Golden, Troy, \$14,127; Burns, McConville Construction Co., Ogdensburg, \$12,034.

Mt. Vernon, N. Y.—Sinking four artesian wells on city property in Hutchinson River Valley for the provision of emergency water supply, by Alderman H. J. Stolte, Chairman of Aldermanic Committee on Water and Sewers, to A. L. Washburn, Pleasantville.

Rochester, N. Y.—Laying water pipe in Group 248, to N. Desiderio, \$16,011.00.

Fargo, N. D.—To James Kennedy, for building filtration plant, \$96,220, for furnishing pumping engines, to Allis, Chalmers Co., \$12,625, and the boilers and stokers, to Minneapolis Steel and Machinery Co., \$7,547.

Mansfield, O.—Water works improvements: 260-h.p. Corliss engine, to Hooven, Owens, Rentschler & Co., Hamilton, \$3,200; pumps, to Henry R. Worthington.

Niles, O.—Construction and equipment of filtration plant, to Ensinger Bros., Columbus, \$32,900; all bids rejected on clear well.

Portland, Ore.—Furnishing 1,500 tons of 6, 8 and 12-in. c-i. pipe, to Oregon Iron and Steel Co., \$22,250; 100 tons of specials, to Smith & Watson Iron Works, \$4,900.

Bellevue, Pa.—By Ohio Valley Water Co. for drilling additional 12-in. wells for the water supply on Neville Island, to J. M. Allen, Pittsburg; Chester & Fleming, Union Bank Bldg., Pittsburg, Engineers.

Nashville, Tenn.—To J. N. Stone Construction Co. for building over 41,000 ft. of water mains touching about 50 streets, \$12,294.49; other bidders: M. J. Cunniff, \$15,442.69; Southern Roofing and Paving Co., \$14,178; T. I. Curtis & Son, \$14,250; E. T. Lewis & Co., \$15,724.31; Foy-Proctor Co., \$16,478.17; J. P. Le Sueur & Co., \$18,761; W. M. Leftwich, \$14,113.70; S. T. Stewart & Bro., \$18,572.96; John Broderick, \$13,773.11.

Rockford, Wash.—Furnishing 1,600 ft. of pipe for water mains, to D. C. Farnsworth.

LIGHTING AND POWER

Grandview, Ark.—North Arkansas Power Co. has been organized by E. H. Ingram and J. R. Neff, Berryville, and E. D. Munger, Springfield, Mo.; will build water power, electric plant and construct tunnel 180 ft. long and concrete dam 300 ft. long, dam to give head of water 25 ft. high; will also develop about 2,860 h. p. for transmission by electricity to Northern Arkansas and Southern Missouri cities; will invite construction bids by Aug. 1.

Mammoth Springs, Ark.—Mammoth Springs Light and Power Co. will develop additional water power and extend transmission lines.

Kingman, Ariz.—Arrangements have been made by the Desert Power and Water Co. to issue \$400,000 bonds to be used for enlarging system; proposed improvements include the installation of additional machinery and extension of its transmission lines to chloride district.

Birmingham, Ala.—Board of Commissioners is considering construction of municipal electric light plant, using North Birmingham electric light plant as nucleus.—Maury Nicholson, City Engineer.

Redwood City, Cal.—Board of Supervisors of San Mateo County has awarded franchise to J. J. Gomes and Benjamin Cunha to operate electric light and power system in country north of Half Moon Bay.

Ault, Col.—Establishment of municipal electric light plant is being considered.

Longmont, Col.—Citizens have voted \$16,000 bonds for construction of electric light plant.

Hartford, Conn.—Hartford City Gas Light Co. will construct steel gas containing vessel 150 ft. in diameter and 150 ft. high on Arch st.

Hastings, Fla.—Installation of electric light plant is being considered.

Tallahassee, Fla.—Bids will be received June 8, noon, for \$15,000 bonds for improving and extending electric and gas plants and water works.—A. H. Williams, City Clerk.

Claxton, Ga.—Council is considering proposition submitted by capitalists for construction of electric light plant and water works.

Macon, Ga.—Macon Gas Light and Water Co. will spend \$45,000 on improvements to gas plant.—H. T. Powell, President.

Twin Falls, Ida.—Council has passed ordinance granting W. W. Seymour and F. C. Brewer right to maintain and operate gas plants and lay mains and pipes for purpose of distributing gas through city streets.

Gibson City, Ill.—Council has granted to A. Hood and H. L. Carke, of Chicago, franchise to construct and operate an electric light plant.

Center Point, Ia.—F. J. Cross, Monticello, has been granted franchises to install and operate electric lighting and power systems in the cities of Center Point, Waker, Coggon and Central City.

Hampton, Ia.—Electric light plant has been destroyed by fire; will be rebuilt.

Keokuk, Ia.—Keokuk Railway and Power Co. is considering installation of one 800-h.p. Cross compound Corliss engine and condenser, for 140-lb. steam pressure; one 400-kw., 133-cycle, 1,100-2,200-volt, three-bearing, composite wound Westinghouse generator, with exciter and switchboard panel; one 400-kw., 550-volt. railway generator with switchboard panel, for power house.—A. D. Ayres, General Manager.

Lake Charles, La.—Bids will be asked for sale of franchise for gas plant.—C. B. Richard, Mayor.

Chestertown, Md.—Council has granted franchise to Philadelphia capitalists for gas plant.

Boston, Mass.—Council has rejected unanimously the Rising Sun Street Lighting Co.'s offer to light side streets and alleyways by gas for next 10 years for \$2,500,000, and referred to the Committee on Finance an order for appropriation of \$300,000 for purchase of equipment to enable city to do its own lighting.

Anderson, Mo.—Harry V. Forest, Kansas City, will construct electric light plant.

Moberly, Mo.—Citizens have voted to grant 20-year gas and electric franchise and five-year street lighting franchise to T. F. Fulkerson, Trenton, Mo.

Queen City, Mo.—City will construct electric light plant to cost \$5,000; will invite bids on machinery.—W. M. Saxbury, Mayor.

St. Louis, Mo.—City Lighting Department will recommend addition of 133 blocks to underground wiring district.

Kimball, Neb.—Plans are being considered for installation of electric light plant.

Rockville Centre, L. I., N. Y.—Appropriation of \$17,000 will be made for erection of a power house; two 800-h.p. boilers will be installed.

Durham, N. C.—Southern Power Co. is planning to build steam power plant at cost of \$250,000.—Albert Milmo, Charlotte, Constructing Agent.

Waynoka, Okla.—Town is having plans prepared by William Haviland, Alva, for electric light plant and water works; \$27,000 bond issue has been voted.—C. D. Willard, Town Clerk.

Eugene, Ore.—Council is considering \$55,000 appropriation to install proposed city lighting system and for betterments in water system; \$25,000 has already been voted.

Roseburg, Ore.—Franchise has been granted to W. F. Boardman & Co., San Francisco, to operate gas system in all the streets and alleys for period of 50 years.

Philadelphia, Pa.—Philadelphia Electric Co. will erect auxiliary power plant on Susquehanna ave.

Greenville, Tenn.—Citizens will vote June 5 on \$65,000 bonds to construct electric light and water plant.

McKenzie, Tenn.—Citizens have voted bonds for extension of electric light system and other improvements.

Bryan, Tex.—Council has purchased the local electric light and power plant and will make improvements and extensions.
Knox City, Tex.—R. W. Warren and associates will install electric light plant, ice ant and steam laundry.
Rosenberg, Tex.—Council is arranging for installation of electric light and power ant.
Mayfield, Utah.—Gunnison Valley Light and Power Co. has been granted franchise.
Casterock, Wash.—Council has passed ordinance granting Silverlake Railway and Lumber Co. power to construct and operate transmission lines within town.
Waitsburg, Wash.—Council has passed ordinance granting Waitsburg Electric Light Co. right to maintain electric light and power lines.
Arcadia, Wis.—Vaughn & Meyer, Milwaukee, will prepare plans for reconstruction of village electric light plant.
Baraboo, Wis.—The Baraboo lighting ant has been sold at auction for \$60,000 to bondholders; new company will be organized and plant greatly improved, with ny current.
Stettler, Alta., Can.—Ratepayers have passed bylaw to install electric power plant to provide for 2,500 16-c.p. lights.

CONTRACTS AWARDED

San Bernardino, Cal.—To Pacific Light and Power Co. for street lighting, \$3.73 per light per month; system will be equipped with new direct current magnetite lamps.
Jacksonville, Fla.—By Board of Bond trustees, to Merrill-Stevens Co. for driving necessary piling for foundations to new electric power plant, which is to be erected in city on Talleyrand, \$1.40 per pile; proposals include furnishing material and doing all necessary work; the piles to be 35 ft. in length and for each additional ft., 7c.
Dalton, Ga.—Construction of new pole and wire line for new electric light plant, to E. L. Hedges Co., Chattanooga, Tenn.
Escanaba, Mich.—Constructing concrete ant and pulp mill on Escanaba River for Escanaba Traction Co., to Bragen & Rice, Green Bay, Wis.
Chillicothe, Mo.—Building electric light ant; Machinery and building foundation and concrete floor, to E. Meek, Chillicothe, \$28,500; brick power house building concrete, to John Gier, Chillicothe, \$5,740.90; brick or concrete chimney, to Metal Concrete Co., Kansas City, \$1,440; pumps, eaters, steam specialties and pipe work, eam engine and equipments, electric apparatus, dynamos, switch board and regulators, pole line and street lighting system, over and tank for water storage, to the Quire Co., Kansas City, \$27,765; deep well r water supply, to Bloom & Hinkle, Independence, Kan., \$2,100; total amount, \$33,354.40.—Fuller & Coultre, St. Louis, Electrical Engineers.
Albany, N. Y.—Lighting city streets for years from June 21, to Municipal Gas Co.
Nyack, N. Y.—To Rockland Light and Power Co. for supplying light to village for five years; arc lights, \$88; 50 c. p., \$28; 25 p., \$19.
Rochester, N. Y.—Installing electricity for sewer and lighting purposes in Buildings bs. 2, 3 and 4, also boiler house at Exposition Park, by Board of Contract and Supply, to Rochester Electric Motor Co., 2375.
Cincinnati, O.—Furnishing 350,000 arc lights, by Union Gas and Electric Co. of is city, to General Electric Co., New York; about \$1,000,000, including installation of lights.
Hampton, Va.—Lighting streets for period of five years, to Newport News and Old Point Railway and Electric Co. and e Hampton, Phoebus and Fort Monroe is Corporation.
Sheboygan, Wis.—Furnishing and installing a 1,500-h.p. turbine and appurtenances for Sheboygan Railway and Light Co., to General Electric Co., Schenectady, N. Y., \$5,000.

FIRE EQUIPMENT

Fort Smith, Ark.—Council has appropriated \$1,100 for purchase of auto fire engine.
Hartford, Conn.—Mayor Jno. M. Halloran has recommended purchase of auto combination hose wagon.
Tampa, Fla.—City will soon purchase a two-driven aerial truck.—B. Torres, Assistant Chief.
La Salle, Ill.—Fire Marshall Matt Buntant has recommended purchase of extension ladders.
Coshen, Ind.—Council has passed ordinance to purchase site for a central fire station and city hall over veto of Mayor Samuel F. Spohn.
Lafayette, La.—Mayor A. R. Trahan has recommended need of electric fire alarm system.

North East, Md. Citizens are considering purchase of steam fire engine.
Chicopee, Mass.—Mayor S. E. Fletcher has signed order for immediate purchase of \$5,000 auto fire truck.
Mason, Mich.—Fire Committee is considering purchase of additional hose.
Butte, Mont.—Fire Chief Peter Sanger has recommended purchase of aerial truck and auto for chief.
Elkhorn, Neb.—Council is considering purchase of fire hose.
Bayonne, N. J.—Bids will at once be asked for rebuilding No. 2 engine and furnishing 2,000 ft. of hose.—Alfred Davis, Fire Chief.
Mountainside, N. J.—Fire Department has been organized.—Wm. Brown, Chief.
West Orange, N. J.—Fire Committee has decided to ask for bids for purchase of auto fire apparatus.—Julius Wiegell, Chairman.
Binghamton, N. Y.—Election on \$15,000 bonds to establish paid fire department is being urged.
Mattewan, N. Y.—Citizens have voted to erect \$15,000 house for W. H. Manse Hook and Ladder Co. No. 1.
New York, N. Y.—Architects Hoppin & Koen, 244 5th ave., have filed plans for erection of \$51,000 truck house at 50th and Lexington sts., \$33,000 truck house on Fulton st., \$75,000 engine house on 111th st. and \$79,000 engine house on 181st st.
New York, N. Y.—Plans have been filed by Architects Hoppin & Koen, 244 5th ave., for erection of \$59,200 fire house on Morris ave., \$31,800 fire house on Castle Hill ave., and \$57,900 house on Bailey ave.
Niagara Falls, N. Y.—Citizens have voted \$42,500 for erection of two fire houses and purchase of three pieces of fire apparatus.
Cleveland, O.—Plans have been completed by Architect Frederic Wm. Striebinger, New England Bldg., for erection of model fire station on W. 112th st.
Massillon, O.—Safety Director Shepley has recommended purchase of 1,500 ft. of fire hose.
Muskogee, Okla.—City is considering purchase of additional auto combination hose and chemical.—John L. Templeton, Chief.
Pottstown, Pa.—Purchase of \$5,700 truck for Empire Hook and Ladder Co. is being considered.
Columbia, S. C.—City will at once erect \$6,000 fire house on Green st.
North Vancouver, Wash.—Fire Chief Turner has recommended installation of fire alarm system, purchase of auto combination hose and chemical wagon and 1,500 ft. of 2½-in. hose.

CONTRACTS AWARDED

San Francisco, Cal.—Erecting fire house No. 43 in Brazil ave., to O. C. Holt, city, \$11,940.
Waterbury, Conn.—To American-La France Fire Engine Co., Elmira, N. Y., for the proposed motor fire engine.
New Bedford, Mass.—Furnishing 3,000 ft. of hose, to American-La France Fire Engine Co., Elmira, N. Y.
New York, N. Y.—Furnishing 500 fire alarm boxes, to Star Electric Co., Binghamton, N. Y.; city will soon need 6,000 additional boxes.
Rochester, N. Y.—Furnishing 3,500 ft. of conductor cable for fire department, to Standard Underground Cable Co., New York, \$609.
Beloit, Wis.—Furnishing 11 fire alarm boxes, to Star Electrical Co., Binghamton, N. Y.; 16 miles of copper-covered steel wire for revamping fire alarm system, to Duplex Metal Co.

BRIDGES

Atlanta, Ga.—Solomon-Norcross Co. of Atlanta has completed plans for viaducts which city proposes to construct on Pryor st. and Central ave. from Decatur to Hunter st.
Fort Wayne, Ind.—Hoomingdale residents are urging County Commissioners to erect bridge across St. Mary's River from Barthold st. to new playgrounds.
Iowa Falls, Ia.—Contract will be let in about 60 days for construction of bridge over Iowa River, to cost about \$15,000.—E. L. Marriage, Eldora, County Auditor.
Independence, Mo.—Jackson County will vote on \$40,000 bridge and culvert construction bonds.
Hackensack, N. J.—Board of Freeholders has instructed the County Engineer to prepare plans for erection of \$200,000 bridge across Hackensack River.
New York, N. Y.—Interstate Bridge Commission has tentatively approved of 57th to 59th st. location for proposed bridge.

Decatur, Ind.—Business men of city have decided to build city hall and fire department building.
Manchester, Ky.—Clay County is considering erection of \$10,000 jail.—T. J. Rowlings, Judge County Court.
Easton, Md.—Grand Jury has recommended purchase of new site and erection of almshouse.
Boston, Mass.—Council has authorized \$120,000 loan for municipal building in South Boston, with court house, public hall, branch library and gymnasium; also \$80,000 loan order for playground in Ward 5 and \$50,000 for playground in Ward 20.
Leominster, Mass.—Voters will soon decide on erection of town hall.
Lowell, Mass.—Council is considering erection of \$1,500 shelter house on South Common; plans prepared. Councilman John J. Coughlin is interested.
Ovett, Miss.—City has decided to erect annex to Charity Hospital.
Camden, N. J.—Council is considering improvements to pier at Pyne Point Park.
Hoboken, N. J.—Council has decided to ask for bids for \$125,000 bonds to erect addition to city hall.
New York, N. Y.—Bethesda Fountain in Central Park will be surrounded by mosaic flooring which will cost \$22,000; mosaic design, work of the Park Department, has been approved by the Municipal Art Commission; work of placing mosaic around will be done this summer.

Yonkers, N. Y.—Board of Estimate and Apportionment has approved ordinance providing for purchase of two oil sprinkling wagons.
Beloit, Wis.—Tentative plans have been prepared for erection of two-story \$55,000 city hall.

CONTRACTS AWARDED

Rochester, N. Y.—Cleaning water mains, to Central Park Main Cleaning Co., \$2,210.
Saranac Lake, N. Y.—Extra street sprinkling, to Fred Williams, 11c. per hour.
Cincinnati, O.—Building general hospital, to Westlake Construction Co., St. Louis, Mo., \$1,648,717 for 18 buildings complete.
Spokane, Wash.—Furnishing three street flushing machines, to Beall & Co., \$1,115 each.

TOO LATE FOR CLASSIFICATION

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Minnesota	Duluth	May 26, 10 a.m.	Grading, paving and otherwise improv. por. of Wyoming st.	Olof G. Olson, Pres. Bd. Pub. Wks.
Kentucky	Louisville	May 29, 2 p.m.	Paving with asphalt 26,237 sq. yds.; 4,521 sq. yds. vitrified brick gutters. Est. cost \$94,000.	Caldwell Norton, Chm. Bd. Pub. Wks.
Ohio	Cincinnati	May 31, noon	Improving Haven Alley, Hooker St. & Buck St. by grading, setting granite curbs, paving roadway with brick macadam and wood block and constructing necessary drains and inlets.	John J. Wenner, Clk. Dept. Pub. Wks.
Pennsylvania	Pittsburg	May 31, 8 p.m.	Grading, curbing and paving various streets, about 6,734 sq. yds. vitrified brick paving and 1,825 sq. yds. vitrified hill-side brick or block.	Jos. Moody, Chm. Street Com. W. G. Stone, Engineer.
New York	Whitesboro	May 31, 8 p.m.	Paving about 7,000 sq. yds. with brick or bitulithic.	Stanley Stuble, Pres. Bd. Co. Comrs. Borough Clerk.
Ohio	Cincinnati	June 2, noon	Repairing Indian Hill avenue in Columbia township.	Stanley Stuble, Pres. Bd. Co. Comrs. Borough Clerk.
Pennsylvania	Arnold	June 5, 8 p.m.	Grading and curbing portion of Kenneth ave.	Stanley Stuble, Pres. Bd. Co. Comrs.
Ohio	Cincinnati	June 16, noon	Improving the Loveland and Madeira road; constructing culvert and approaches on Betts ave. in Springfield township.	Stanley Stuble, Pres. Bd. Co. Comrs.
SEWERAGE				
New York	White Plains	June 1, 1:30 p.m.	Laying in a water tight manner 322 ft. of 48-in. cast iron pipe from the end of the sewer as now laid, extending out into the Hudson river, in a double line 161 ft.	F. N. Glover, Sec'y Bronx. Val. S. C. Olof G. Olson, Pres. Bd. Pub. Wks.
Minnesota	Duluth	May 26, 10 a.m.	Constructing sanitary sewers in various streets.	Olof G. Olson, Pres. Bd. Pub. Wks.
Pennsylvania	Johnstown	June 1, 4 p.m.	Constr. 1,240 ft. of 8 to 12-in. terra cotta sewers with appurtenances, in Dale Borough.	O. P. Thomas, Boro. Engr.
WATER SUPPLY				
Virginia	Lexington	June 1, noon	Furn. 41,800 ft. of wood pipe and 16,800 ft. of 8-in. cast iron pipe, valves and special castings; also, building a small concrete intake and pipe laying.	N. Wilson Davis, Engr. Harrisb. Va.
Michigan	Marquette	June 9	Constr. an extension to the water works intake, consisting of about 2,230 ft. of 36-in. c. i. pipe with all appurtenances, riprap, dredging, etc.	J. P. Kern, Secy. Bd. Fire & W. C. Geo. H. Davis, Town Clerk.
Wyoming	Upton	June 9	Constructing system of water works.	Geo. H. Davis, Town Clerk.
BRIDGES				
Delaware	Wilmington	May 29, noon	Rebuilding of the long bridge over Northwest branch of Smyrna river in New Castle County.	County Engineer. J. S. Whitaker, County Auditor.
Indiana	Martinsville	June 5, 2 p.m.	Constr. a concrete bridge over White river at Waverly.	County Engineer. J. S. Whitaker, County Auditor.
Indiana	Salem	June 5, 1:30 p.m.	Constr. a concrete bridge at Colvin's Ford in Jackson twp; steel bridge on stone abutments and fills in Brown twp; crossing of concrete at Reymon Ford, Washington twp.	Frank S. Munkelt, Co. Aud. G. B. Huntington, County Aud.
Indiana	Shelbyville	June 6, 10 a.m.	Constructing certain culverts, abutments, etc.	Frank S. Munkelt, Co. Aud. G. B. Huntington, County Aud.
LIGHTING AND POWER				
Virginia	Barton Heights	June 9	Installing a municipal gas plant.	Town Clerk.
MISCELLANEOUS				
Texas	San Antonio	June 12, 10 a.m.	Remodeling the county jail, est. cost about \$50,000.	County Commissioners.

STREET IMPROVEMENTS

Santa Monica, Cal.—Council has decided to widen Peer ave. between Ocean Front and Main st. from 50 to 63 ft.

Canon City, Cal.—Work will soon begin on construction of road between this city and Salida; Legislature has appropriated \$26,000.

Jacksonville, Fla.—County Commissioners have decided to construct remainder of highway leading to Fernandina; cost, including bridge over Nassau River, \$78,942.

Freeport, Ill.—Board of Local Improvements is considering plans for paving Galena st. and Lincoln ave.

Harlan, Ia.—Council has refused to accept all bids for paving fifteen blocks in the business and residence districts of this city for the reason that the lowest bidders failed to file a sufficient certified check; lowest bidders were as follows: G. Mancini, Omaha, \$21,201.10; John Beebee, Omaha, \$21,504.55, and H. C. McMakin & Son, Platte, Neb., \$22,219.75; Council ordered readvertisement for bids, and contract will be let on June 5.

Lexington, Ky.—Council has ordered reconstruction of Maxwell st. from Woodland ave. to High st.

Bemidji, Minn.—Citizens will vote May 31 on \$20,000 bonds to pave eleven business blocks.

Bethany, Mo.—Preliminary surveys covering about 12,000 yds. have been ordered; concrete pavement, curb and gutter are contemplated.—John J. Werninger, County Surveyor.

Jersey City, N. J.—The Street and Water Board has adopted specifications for improvement of Wilkinson ave., Neptune ave. and Pearsall ave.; Chief Eugene Van Keuren has been ordered to prepare specifications for repaving of Tonnele ave. from Broadway to Tonnele ave.

New Egypt, N. J.—Engineer Cranmer is surveying proposed new gravel road between this place and Lakewood.

Trenton, N. J.—Following instructions from State Road Commissioner Stevens, County Engineers of Mercer, Hunterdon, Warren and Sussex counties will shortly begin survey for the Delaware River Drive from Trenton to New York line at Port Jervis.

Penn Yan, N. Y.—Jas. Brennan, Geneva, Engineer, will make survey and estimate of cost of paving Main and East sts. with brick.

Rochester, N. Y.—Council has passed following improvement ordinances: Commer-

cial st. cement walks, estimate \$275; Cumberland st. resurfacing, \$10,000; Delmar st. grading and walks, \$1,900; Magee ave. cement walks, \$1,000; Lyell ave. Medina block pavement, between rails of the New York State Railways, \$32,000; Aves. A and B, Vick Park, care and embellishment, \$440; Massets st. resurfacing, \$3,000; Van Stallen st. brick pavement, \$11,000; Rohr st. brick pavement, \$16,400; Iroquois st. brick pavement, \$5,600; Copeland st. brick pavement, \$9,000; Humboldt st. grading, \$8,000; Winton road N. asphalt pavement, \$13,000; sanitary and storm water sewer in Blossom road, \$25,000; Gardiner ave. asphalt pavement, \$16,000; Lakeview Terrace asphalt pavement, \$6,000; Ave. D asphalt pavement, \$29,000; Sawyer st. asphalt pavement, \$36,000; Zimbrich st. brick pavement, \$6,000.

Bonham, Tex.—Citizens have voted \$100,000 street paving bonds.

Vancouver, Wash.—Tenth st. from Washington to Reserve, the entrance to Vancouver barracks, will be paved with hard surface pavement.

Seattle, Wash.—Board of Public Works has approved plans and specifications for grading and paving University and other streets, filling Fifth ave., South, and grading Twenty-fifth ave.

Spokane, Wash.—City Commissioners have rejected all bids for improving five streets.

CONTRACTS AWARDED

Phoenix, Ariz.—Paving principal business streets, about 25,000 sq. yds., with bitulithic, to Barber Asphalt Paving Co., Los Angeles; Bitulithic paving, per sq. yd., including excavation and grading, \$2.09; gutter, per lin. ft., 50c.; curb, per lin. ft., 27c.; 24-in. drainage pipe, per lin. ft., \$1.50; 18-in. drainage pipe, per lin. ft., \$1; other bidders were: Worsyck Asphalt Paving Co., Fresno, Cal.; Texas Bitulithic Co., El Paso, Tex.; Arizona Paving Co., city, and Federal Construction Co., San Francisco.

Lodi, Cal.—Paving several blocks of Main st. with asphalt, to Barber Asphalt Co., \$35,697.07.

Pasadena, Cal.—To the Barber Asphalt Company, Los Angeles, for paving South Orange Grove ave., \$84,536, or 19½c. sq. ft.; G. M. Gerst, San Francisco, to build underground conduit along same thoroughfare, \$45,000.

Tampa, Fla.—Paving number of streets and roads, Barber Asphalt Co., Birmingham, Ala., only bidder, \$1.25 per sq. yd.

Lewiston, Ida.—Grading and improving streets in Normal Hill residence district, to Miracle Construction Co., Kaispell, Mont.; work involves about 7 miles of street improvements and 14 miles of concrete curb and gutter; about \$74,000.

Boston, Mass.—To James Doherty for tar macadam roadway in Wales st., between Harvard st. and Talbot ave., \$5,139.80; other bidders: D. E. Lynch, \$5,979.70; W. J. Rafferty Co., \$5,556.20; F. S. & A. D. Gore Corp., \$5,175; R. J. Young & Co., \$5,709; Jeremiah J. Sullivan, \$5,476.40; John McCourt & Co., \$5,685.20; Engineer's estimate, \$9,100; artificial stone sidewalks in Spencer st., between Athelwold st. and Talbot ave., to James Doherty, \$3,129; other bidders: Adam Pond Co., \$3,275.02; W. A. Murfield Co., \$3,337.60; Warren Bros. Co., \$3,312.57; Jeremiah J. Sullivan, \$3,233.30; Engineer's estimate, \$3,725; to John Kelly & Co. for tar macadam roadway in Ardale st., between Walter and Centre sts., \$11,543.80; other bidders: Daniel E. Lynch, \$13,551.50; Thomas F. Min-ton, \$12,176.75; West Roxbury Trap Rock Co., \$13,949.50; William J. Rafferty Co., \$12,529.70; Engineer's estimate, \$14,600; to Central Construction Co. for brick block pavement in Geneva ave., between Columbia road and Bowdoin st., Mack block \$23,810.60; other bidders: Peter W. Hill Mack block, \$28,267.50; Coleman Bros. Clearfield and Mack block, \$24,735.30; John F. O'Connell, no block specified, \$25,026.50; William L. Dolan, Bessemer block, \$24,075.50; F. H. Cowin Co., no block specified, \$25,311.50; James Doherty, Mack block, \$24,157.20; Shawmut block, \$23,804.40; Engineer's estimate, \$30,700; to Timothy Coughlan for building retaining walls and fences on westerly side of Washington st., between Kittredge and Albano sts., West Roxbury, \$600; other bidders: Adams Pond Co., \$699; McCarthy & Walsh, \$840; John A. Costello & Co., \$846; West Roxbury Trap Rock Co., \$900; R. J. Young & Co., \$950; M. De Sisto & Co., \$985; R. Cartelle \$997.50; F. Williams & Co., \$1,016; John McCourt & Co., \$1,290; E. De Christoforo \$1,294; to Adams Pond Co. for artificial stone sidewalks in Melville ave., between Washington st. and Dorchester ave., 34.00 sq. ft., \$5,100; other bidders: Warren Bros. Co., \$5,355; James Doherty, \$5,423; Jeremiah J. Sullivan, \$5,440; Engineer's estimate, \$6,000.

Sewaren, N. J.—To M. Irving Demares for construction of macadam road in Hunterdon County extending through Lebanon Township toward Trenton, \$37,780.

NEW YORK, MAY 31, 1911

No. 22

GENERAL VIEW OF OLD BRIDGE AND EXTENDED PIERS FOR NEW ONE PARTLY BUILT

CONCRETE ARCH ROADWAY BRIDGE

cross the Genesee River at Rochester—Reconstructing and Extending Masonry Piers—Details of Concrete Work—Imitation Granite Facing—Tower Distribution of Concrete

A CONCRETE arch bridge is being constructed by the city of Rochester, N. Y., across the Genesee river, on the line of Central avenue, parallel and close to the bridge of the New York Central Railroad, in which several more or less novel features are being introduced. This is to replace a bridge 46 feet wide which was carried on three lines of steel trusses supported by nine piers. The old piers are being strengthened and rebuilt to support the arches of the new bridge, which is to be 66 feet wide. The contractor is using the old bridge, which has been closed to traffic, to carry the traveler

by which he is placing the steel latticed arches which form the reinforcement of the arch ribs.

The new bridge consists of 14 lines of arch ribs spaced 5 feet between centers, each line consisting of spans of 18, 25, 33, 39, 47, 53, 61 and 68 feet respectively, these arches supporting a reinforced concrete slab floor. Each arch consists of a steel latticed arch which is constructed complete in the shop and, after being set in place, is completely encased with concrete. There is a roadway 42 feet wide between curbs, and a sidewalk on each side 9½ feet between curb and para-

pet wall. The parapet is surmounted by a balustrade comprising posts, balusters and rail, all of concrete.

In reconstructing the old piers, which were of masonry, more or less of the top masonry of each is removed and a facing of concrete placed enclosing the old masonry, and additional concrete employed to extend the piers to the desired height and for several feet up stream. The piers rest on bed rock which forms the bed of the river, and the concrete extensions also rest on this. To insure a bond between the old masonry and the concrete facing, a great number of iron bolts are inserted and firmly fixed in the old masonry, extending for several inches from the face of this and having their ends turned up for about an inch. These are inserted at an oblique angle with the face of the pier so as not to pull out easily. On these as brackets are placed reinforcing rods; the whole being embedded in the concrete facing. The nosings of the new piers are of cut granite, no course less than 12 inches thick, which were built before the concrete and provided with anchor irons which extend into the concrete bodies of the piers, when they are placed, to tie the two together. The steel arches are placed before the piers have been carried to their full height, and their footings are thus embedded in the concrete of the piers.

One of the illustrations shows a number of the steel arches in place; and this and another show the recesses left in the piers to receive the concrete of the arch ribs.

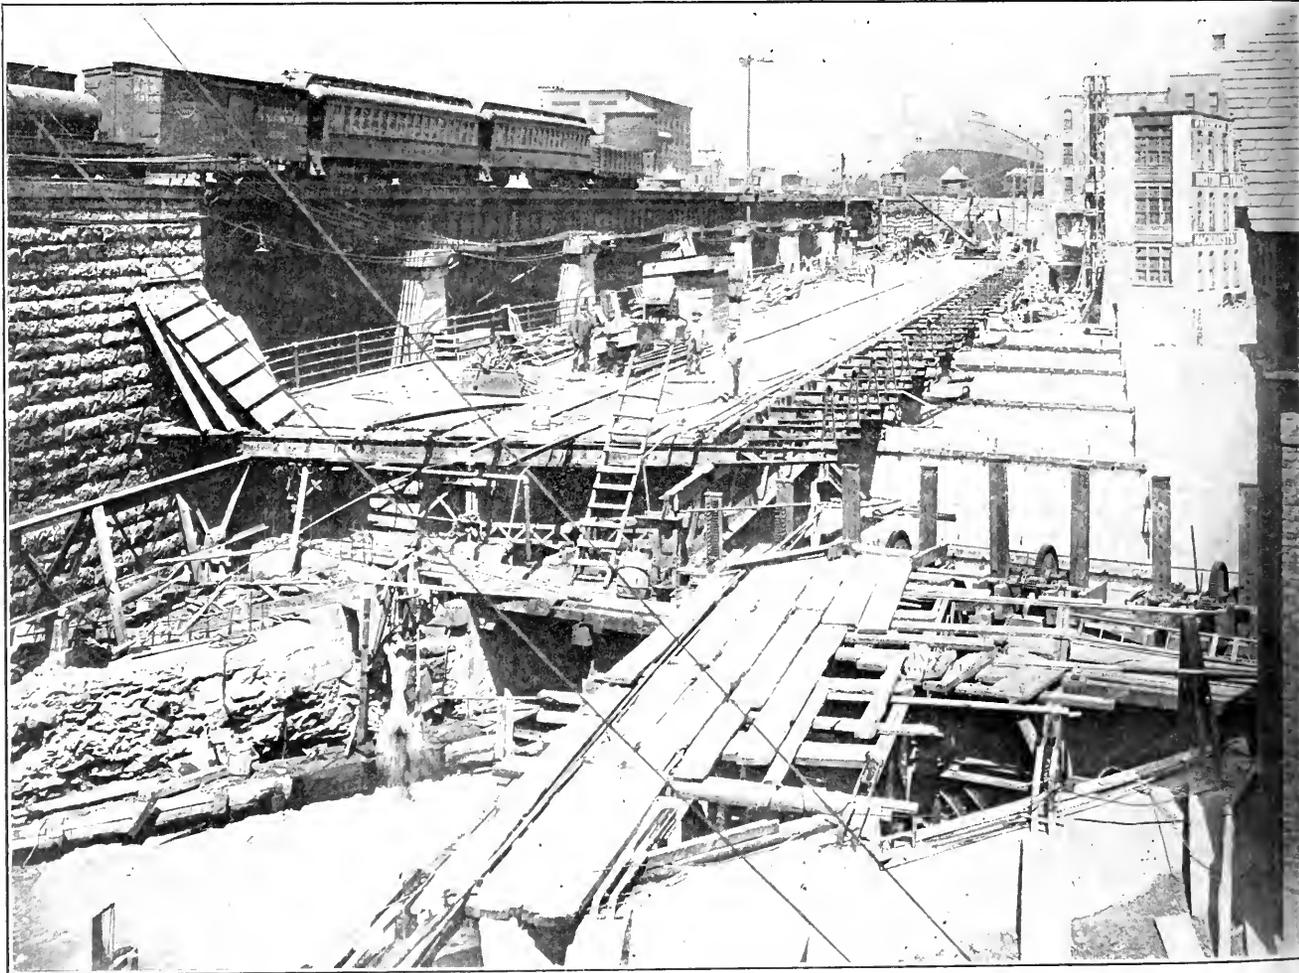

To assist in binding the concrete to the bottom chords of the arches, these are furnished with wires bent to the form of a flat heart or "pretzel" (by which name they are called) spaced 9 inches apart. These are sprung open and placed around the bottom flanges, from which they hang. The same object had been aimed at in a previous bridge by binding the bottom chord

with wire netting, but it was found that the concrete failed to pass through the netting as thoroughly and readily as was desired.

The forms for the concrete of the arch ribs are not supported on centering, but are suspended from the steel arches. This not only obviates the necessity of building centering over a river subject to floods, but also applies a weight to the arch before the concrete has begun to set, and thus to some degree avoids stresses and deflections in the concrete which would occur if the steel arch had carried no weight until after the concrete had set and the centering been removed, when the imposing of the weight on the arch would cause a deflection.

The roadway slabs are to be reinforced transversely with $\frac{1}{2}$ -inch square bars spaced 8 inches between centers, and longitudinally with $\frac{1}{4}$ -inch round bars 12 inches between centers. The roadway is to be paved with creosoted wood blocks. The curbs will be of granite. The sidewalk slabs will be of reinforced concrete, surfaced with 2 inches of asphalt mastic. They will have a slope of $\frac{1}{4}$ inch to the foot toward the roadway.

The balustrade spindles are cast separately in smooth cast iron moulds. Each will have a $\frac{1}{4}$ inch wrought iron pipe passing through its center and extending about 2 inches from each end. When the parapet wall is cast, holes will be left regularly along its top, and into the holes will be inserted the ends of the pipes projecting from the lower ends of the balusters. After these are in place and lined up thin grout will be poured into the pipes and fill the holes in the parapet to firmly bind the balusters in place. The top rail will then be moulded in a form around the tops of the balusters and its own reinforcing rods, previously placed in position. Follow-

OLD BRIDGE PARTLY DEMOLISHED

Comparing this with illustration on p. 771 it is seen that buildings in the background have been partly demolished to permit widening Central Avenue. In the foreground is a raceway, and at the right the gearing by which the gates to the same are operated. In the distance, partly hidden by a building, is a tower for distributing concrete.

ing this the posts will be constructed in their forms. The rails will be made of such length as to extend about 6 inches into each post. Before the post concrete is placed, about 2 inches of clay will be plastered on the end of the rail, and the surface where it enters the post washed with clay and wrapped with paper or oakum. This is to permit expansion and contraction in the rail without moving the post.

In the center of each of the heavy balustrade piers, one of which is placed over each pier and abutment, will be placed a 4-inch pipe to carry lighting wires to furnish current to the lamps. A lamp standard will be placed on top of each pier, fastened in sockets left in the tops of the piers.

Beneath each sidewalk the two continuous recesses between arch ribs from end to end of the bridge will be arranged for use as wire conduits. Forty-pound steel rails, spaced 12 feet apart, will be placed across these recesses to support wire ducts. The two outside ones may be reserved for high tension and the inner ones for low tension wires. Near the center of the bridge a manhole opening will be left in each sidewalk to give access to the wire conduits.

A wooden dam about 4 feet high, just up stream from the bridge and making an angle with its direction interfered with the extension of the piers and was replaced by a concrete one parallel to the bridge, the lines of the two intersecting at about mid-stream. A trench about a foot deep was blasted out along the center line of the new dam, to hold it in place against the pressure of ice and logs which come down in considerable quantities at certain seasons. Also on account of the logs there was constructed from each pier nosing to the dam crest, a distance of about 10 feet, a buttress whose top was level with the crest of the dam.

The concrete is mixed in two grades, class A being 1:2:4 and class B 1:2½:5. The former is used in the superstructure, the latter in the substructure, dam and buttresses. Bids were received for class B only; where class A is ordered it is paid for at a rate 8 per cent greater than the bid. The sand is permitted to contain up to 7 per cent of clay, loam or other foreign matter. In proportioning, each bag of cement is considered as one cubic foot when the concrete is machine mixed, but as only 0.9 of a foot when hand mixed.

Forms are of planed pine, the surfaces next to the concrete being given three good coats of boiled linseed oil applied with brush, and not used until the oil is dry.

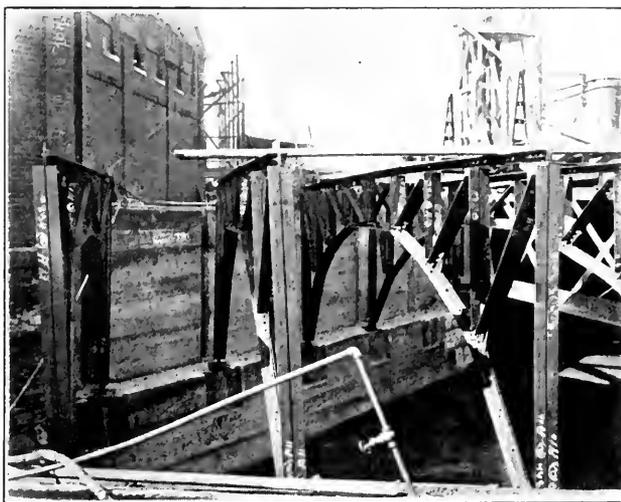

Each arch rib is to be poured continuously so as to form a monolith. A space two feet wide will be left at each pier, between the concrete of successive arches, to be filled with concrete after that in the arches has taken its set. This is to provide for any slight changes in the volume of the concrete while setting.

For the same reason a very unusual provision is made for joining new to old concrete. This and the one just mentioned are the result of experiments conducted by John F. Skinner, principal assistant city engineer, which we expect to describe in a later issue. The specifications read as follows:

Before laying new concrete upon or in contact with that which has been already laid and has set, the old material shall be thoroughly cleaned with water and brooms and, if necessary, roughened. Special care must be taken to remove all loose, inert or foreign material from the old concrete before any attempt at bonding the new work is made. If laitance is collected it must be carefully and completely removed before the new material is added. Upon this prepared surface shall be spread a thin coat of mortar which shall be mixed of one part cement and two parts sand, and which has been thoroughly re-tempered shortly after having taken its initial set. This mortar shall be applied thin, and shall be well rushed into the old concrete with ordinary brooms. After this has been done the new concrete shall be immediately placed on this bonding material. These joints must be made with great care and in a manner satisfactory to the engineer.

The use of *re-tempered* concrete is the special novelty.

A granolithic finish is applied as a facing to all exposed surfaces such as the balustrade, parapet, spandrels and faces of exterior arch ribs. It is 3 inches thick and is placed in the forms just before or at the same time as the placing of the mass concrete. It is composed of one part white Portland cement, two parts clean white sand and three parts crushed

STEEL ARCHES IN PLACE, READY FOR THE ENCASING CONCRETE

Barre granite which will pass a ¼-inch sieve. As soon as possible the forms are removed and the surface washed and scrubbed with water and brushes until the grit is exposed. This gives an excellent imitation of light granite.

Most of the details above described had previously been employed by the city on the Red Creek bridge, a single span bridge in Genesee Valley Park, or had been suggested by experiences with that bridge.

The concrete is being mixed with a Milwaukee mixer, immediately adjacent to which is a timber tower about sixty feet high from which it is distributed. The concrete is raised to the top of the tower, or to some intermediate point, depending upon the distance to the work in progress, in Koppel buckets. Here it is automatically dumped into chutes through which it runs to the point where it is wanted. These chutes consist of 10-foot lengths of U shaped steel troughs 15 inches across, which are suspended by small blocks and falls from a steel cable.

The coffer dams around the foundations are pumped out by a pulsometer. The steel arches and other heavy materials are handled by a traveling boom derrick and four-drum hoist; the traveler running on the floor of the old bridge.

The contractors for the entire work were Whitmore, Rauber and Vicinus. The plans were prepared and the construction is being supervised by the City Engineering Department. E. A. Fisher, city engineer.

WATER WORKS QUESTIONS

At the June 7 session of the convention of the American Water Works Association it is proposed to discuss a number of questions of considerable interest to water works officials, of which the following seem to us to be the most important:

Washing mechanical filters with clear but unfiltered water. Using oil for fuel as compared with coal. Red color in hot water. Calking lead joints with pneumatic tools. Metering free public supplies. Preventing electrolysis. Limitations to the use of hypochlorite. Steam turbine pumps. Under-registration of water meters. Locating leaks in mains under concrete pavement foundations. Connecting electric light wires to mains or fire hydrants. The most satisfactory method of fixing water rates, whether by a minimum charge varying with the size of the meter, an overhead charge varying with the size of the meter, a greater charge for the first few thousand feet than for larger quantities, or a uniform rate for all quantities sufficiently high to produce the necessary revenue. Concerning failures in the pipe system, have these increased during the past twenty years in greater proportion than the increased mileage of the system; are the failures uniformly distributed; are they aggravated by outside influences; in what kind and conditions of soils have most of the failures occurred, and has chemical action from the surrounding soil been the only apparent cause in any cases?

EFFICIENCY RECORDS

Desirability for Municipal Departments—System Employed in New York—Division Into Three Classes—Use by Civil Service Commission

By LEONARD FELIX FULD, LL.M., Ph.D., Examiner, Municipal Civil Service Commission, New York

IN a small private business organization there is no need for efficiency records. The head of the business enjoys a permanency of tenure and he is brought daily into such close and intimate contact with his employees that he possesses personal knowledge of the efficiency of each employee, which he can utilize not only in maintaining the efficiency of his working force, but also in determining which employees shall be promoted in salary or in position. The need of efficiency records first becomes felt when the organization becomes so large that the head of it does not come into personal contact with all of his subordinates, and if in addition either the head of the organization or his principal supervising subordinates do not enjoy a permanent tenure the need of efficiency records kept contemporaneously becomes even greater. In the various departments of the municipal public service the head of department enjoys an exceedingly short tenure of office and comes into personal contact with very few of the hundreds of employees under his jurisdiction. He is obliged to rely upon the reports of his supervising subordinates, who also do not enjoy the same stability of tenure found in the case of similar men in private life. This condition of affairs renders imperative that the records of the employees' efficiency be carefully kept.

Under the efficiency record system which has recently been installed in the civil service of the City of New York the supervising officer most closely in touch with the work of the employees is required to furnish quarterly a descriptive report upon the efficiency of the employees under his jurisdiction. In this report he divides his employees into three classes. In the first class he places those who have performed their duties satisfactorily. In every office this class ought to include a large majority of the employees, and in the case of these employees the reporting officer need only give their names and their titles. In the second class he places those whose work has been more than satisfactory—those who have distinguished themselves by marked intelligence and zeal in the performance of their duties. These employees are selected by the reporting officer by establishing a standard of average efficiency among the subordinates under his jurisdiction and then picking out for special mention those employees whose work has been distinctly superior to the grade of work performed by the majority of his employees. In the case of these superior employees it is required that the reporting officer furnish in addition to the name and title of the employee a specific statement of his reasons for considering his work above the average of his office force. The reason assigned by the reporting officer must give the particulars in which the employee's work excels that of the other employees under his jurisdiction.

In the same manner the reporting officer places in a third class those whose work has been less satisfactory or unsatisfactory. These are the employees whose work has been distinctly below that of the average of his department or bureau. For those who are placed in this unsatisfactory class reasons must also be assigned, giving the particulars of the unsatisfactory character of their work. On the report blank on which these efficiency reports are made a separate page is reserved for the employees of each of these three classes. This report blank is a four-page blank. On the first page are printed the instructions to the reporting officer and at the bottom is a space reserved for the date and the signature of the reporting officer. The second page is for the names and the titles of the employees who belong to the satisfactory class. The third page is intended for the names, the titles and the particulars of those who are considered to be in the "more than satisfactory" or "above the average" class, and the fourth page is reserved for

the names, the titles and the particulars of those placed in the less than satisfactory or unsatisfactory class.

In the preparation of these quarterly efficiency reports each bureau chief and other reporting officer establishes a standard of average efficiency for his bureau and classifies his employees in accordance therewith. When promotions are made, however, as the result of a promotion examination the employees of all the bureaus of the department are brought into competition and it would be unjust to rate competitively their records which have been prepared in accordance with varying bureau standards. Under such a system the employees under the jurisdiction of a lenient marking officer would be rated "more than satisfactory" or "above the average" for the same grade of work as other employees under a more severe marking officer might be rated merely "satisfactory" or "average" or even "less than satisfactory" or "below the average." To obviate this difficulty and prevent this injustice there has been provided under the New York system of keeping efficiency records a board of promotion for each department of the municipal government.

The board of promotion consists of at least three superior administrative officers of the department designated by the appointing officer of the department subject to the approval of the Municipal Civil Service Commission. In the actual administration of this efficiency record system the members of the board of promotion are generally the more important bureau chiefs or other supervisory administrative officers of the department and the appointment is made by the head of the department. This board of promotion holds a meeting quarterly for the purpose of considering the efficiency reports submitted by the rating officers of the departments, and at these quarterly meetings it rates the employees subject to its jurisdiction. The board of promotion organizes by the election of a chairman and the designation of a clerk to keep and transcribe stenographic minutes of its deliberations and to make the entries in the efficiency record book of the department. The board considers each of the reports submitted to it separately. It may in its discretion accept the reports as submitted or it may change the reports as they affect individual employees. If in the exercise of its discretion, however, it sees fit to change a report, the members of the board are required to state the reasons for this change in the minutes of the board of promotion.

Employees who have been reported by their superiors as having performed satisfactory service and in whose case the promotion board agrees with the report of the employee's superior officer are rated "C" on all items of their efficiency record. In the case of those who have been reported for sufficient reasons as being either more or less than satisfactory and in the case of those who having been reported as merely satisfactory are considered by the members of the promotion board for reasons specified in their minutes to be either more or less than satisfactory, the board is required to assign definite marks in each of the six items of their efficiency record. These items are quality of work, quantity of work, general conduct, executive ability and capacity for initiative, average general efficiency, and punctuality. The average general efficiency mark is the average of the ratings given on the first four items of the efficiency record—quality of work, quantity of work, general conduct, and executive ability and capacity for initiative. The mark for punctuality, which includes attendance, is kept separately. No mathematical formula is required to be followed in determining the mark for average general efficiency; the determination of the relative weight to be attached to each of the component elements of this mark is left entirely in the discretion of the promotion board. It is, therefore, allowable to rate an employee "C" in three of the four items of his efficiency record and yet give him an average general efficiency mark of "B," if in the opinion of the promotion board the fourth item of the record on which he was given a rating of "B" is more important in the case of that employee than the other three items of his record.

The marks are entered in specially prepared efficiency record books supplied to each department by the Civil Service Commission. The efficiency record books, the original quarterly re-

ports to the promotion board and the minutes of the promotion board's meetings are inspected at regular intervals by an examiner of the Civil Service Commission. This inspection not only affords an opportunity for the introduction of such additional safeguards as may be deemed necessary to protect the integrity of the records, as, for example, the time-stamping of each report with the date of its receipt, the initialing of all changes in the marks entered in the efficiency record book, etc., but also presents an opportunity to the heads of the various departments to discuss the needs of the department from the point of view of its personnel with a representative of the Civil Service Commission, who can report to the commission such suggestions and recommendations of the heads of departments as seem to possess practical merit. A detailed report is submitted by the examiner after each departmental inspection.

Once each year a transcript of the marks entered in the efficiency record books of each department is sent to the Civil Service Commission and entered upon the efficiency record cards kept by the Civil Service Commission for each employee in the city service. These efficiency records are kept for all employees in the competitive class of the civil service, excepting the members of the uniformed police and fire-fighting forces. Furthermore, no efficiency records are kept by the Civil Service Commission for school teachers, laborers and employees in the city service who are not subjected to examination. In every promotion examination the average percentage of each candidate is determined by his percentage on his written examination and his percentage on his efficiency record and seniority. A weight of 50 per cent is attached to the written examination and a weight of 50 per cent is attached to the efficiency record and seniority. No candidate, however can have his name placed upon a promotion eligible list unless he secures at least 70 per cent in his written examination.

[The writer will be pleased to give any additional information which municipal officers may desire regarding the New York system for the keeping of efficiency records and the rating of these records in promotion examinations.]

LOUISVILLE WATER WORKS FILTERS

The filter plant of the Louisville water works, which has been described by us, was in continuous and successful operation throughout the year 1910, although for a considerable portion of the time it was working under adverse conditions due to the delays in completing the coagulating basin and the cleaning of the reservoirs. During the year 8,315,272,730 gallons of water were filtered at a cost per million gallons of \$3.46. This cost varied from a maximum of \$4.51 in March to \$2.57 in August. The principal item of variation in the monthly cost was the coagulant, this varying from the maximum of \$1,751 to a minimum of \$482.65. The cost per million gallons of the several items was as follows: Superintendence and laboratory pay-roll, 42 cents; filter operators' pay-roll, 92 cents; coagulant, \$1.49; wash water, 5½ cents; heat, light and

power, 23½ cents; supplies, 10 cents; repairs, 15 cents; incidentals, 9 cents.

The average results of the filtration was a reduction of the alkalinity from 68 to 59; a reduction of the bacteria per c. c. from 14,860 to 208; of the turbidity from 196 to zero. The amount of wash water required averaged 2.82 per cent of that filtered, this varying from a minimum of 1.82 in June to a maximum of 6.80 in August. The alumina sulphate used averaged 1.25 grains per gallon, this varying from 0.57 in August to 1.99 in July. The free ammonia was reduced 42 per cent; albumenoid ammonia, 71 per cent; nitrites, 75 per cent and oxygen consumed, 63 per cent.

The bacterial reduction obtained by the filters was not as great in most instances as would be considered desirable, and it was hoped to produce better results by installing a small auxiliary apparatus for supplying hypochlorite of lime in conjunction with the other media used in filtration.

A gratifying reduction in typhoid death rate has occurred since the filter was put in service. The average number of deaths from typhoid for the years 1906, 1907, 1908 and 1909 was 127, equivalent to 58 per 100,000 of population; while for the year 1910—the first full year in which filtered water was used—the death rate was but 26 per 100,000. It is believed this would have been much lower but for the fact that many of the citizens persist in using well water, which is more or less polluted.

As stated, the coagulating basin was not in service during the entire year; in fact, the southerly division was not in use until August 25, and the northerly division had not been accepted from the contractors at the end of the year, owing to the development of certain leaks in the bottom and side walls.

SIDEWALK FALLACIES

By JEROME B. LANDFIELD

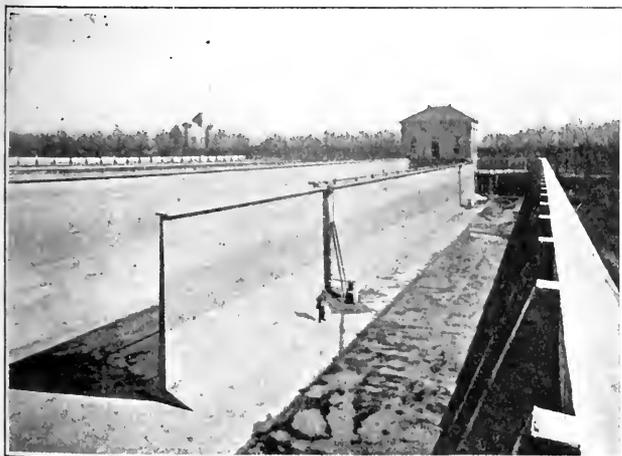

A good proportion of all of the sidewalk work that is being done nowadays is constructed under the direction of engineers, or in accordance with specifications laid down by them. It is therefore strange that there should be such a diversity in the methods employed and in results obtained. This is a curious state of affairs, considering the extent of the work and the opportunities afforded for determining to a nicety the best possible practice.

Where there is such diversity of practice it naturally follows that in some cases it is correct and in others all wrong. There seems to be a mistaken notion that sidewalk work is not deserving of serious attention and may be properly left to the untrained man. What is true of sidewalk work is equally true of concrete curb and combined curb and gutter work. Surely this is a great mistake and municipal engineers in particular should realize that they owe it to their profession to devote sufficient attention to the subject to secure first-class results.

In this paper I desire to point out a few fallacies that have crept into sidewalk and curb and gutter work from different sources, especially those which have been sanctioned in many instances by engineers of standing.

Probably the most generally accepted fallacy is that of the cinder sub-base, and it is a fallacy that has cost our cities hundreds of thousands of dollars. It is probable that the fact that many are to-day specifying that a sub-base of cinders or sand should be put under a walk can be explained in this way. In the laying of flags of natural stone the under side of the flag was nearly always irregular and to dig out and shape the natural soil to fit it was a task quite out of the question. It was far easier and more practical to fill the excavation with cinders or sand, which would naturally mold itself to fit the configuration of the under side of the stone. What was more natural than to continue the same practice when concrete walks came to be laid, and to set up the argument that this sub-base ensured good drainage and was a safeguard against heaving due to frost?

This sounded perfectly plausible. In fact, I presume that a large portion of those who read this article will regard the views expressed in it as heretical. But the following fact

COAGULATING BASIN, SHOWING BAFFLE WALL, LOUISVILLE

appears pertinent. If one lifts a good-sized flat stone from its resting place in a field in the winter time he will notice that there is rarely to be found beneath it any frozen ground, while all around are evidences of frost. The reason is that, first of all, the natural soil that forms its bed is tightly packed so as to make a snug resting place that did not admit water readily, and, next, that the stone itself under these conditions affords good protection.

Now consider for a moment the concrete sidewalk. In constructing this, first the natural soil is removed whether it be clay, gravel or hardpan, making a trench that becomes the finest kind of reservoir to collect moisture. This trench is then filled with porous material that never becomes as compact as the original soil, but which absorbs and holds moisture like a sponge. Even if tile is placed in the bottom of this trench, this does not make the sub-base any the less a sponge. Four or 5 in. of concrete would have protected the compacted natural soil that would hug it so closely as scarcely to admit any water, but severe cold is very liable to freeze the cinder foundation in spite of the concrete. These are some of the considerations that lead me to believe that the cinder sub-base is useless and detrimental, even when carefully drained with tiles, and extended practice bears this out.

Another fallacy that is very prevalent, but which is happily growing less, is the idea that a sloppy top-coat is good practice. Somehow or other many concrete men have got the notion that in sidewalk work the wetter the mix the better. They argue from experience in other kinds of work where they find that poured concrete makes a dense mass and reduces the voids, and do not take into account the points wherein the conditions differ. Let us consider just what the conditions of sidewalk work are and how they affect the question of how much water to use.

In sidewalk work water-tight molds are not used in which to form the blocks. The mass dealt with is thin and has two large surfaces, one of which is exposed to the absorbent action of the ground beneath, and the other to the drying action of the air. If, therefore, too much water is put into the concrete there is a tendency for it to drain away and carry with it particles of cement washed from the aggregate. If less water were used and the mass well mixed, the whole amount of water would be closely engaged with the cement. In warm climates it is frequently argued that more water should be used in order that the surface may not dry out too rapidly. But here we have also a fallacy. If there is more water at the surface than is needed for the setting of the cement, there is almost certain to have been flushed to the surface considerable neat cement and as the surplus water evaporates the foundation is laid for hair-cracks. The correct way is to use the proper amount of water and then protect the surface against the heat.

The lower course should have just enough water so that it will not quake when tamped. The top-coat should be mixed stiff enough so that you can mold it in the hand and it should be put on while the lower course is fresh and green. Then tamp it lightly, remove the surplus material by striking it off, and finish immediately with a wooden float. The tamping of the top-coat is of great importance for fine work and it really does not add to the expense, as it simplifies finishing. The first effect is to make the top-course dense and to bond it mechanically to the base. The moisture is distributed evenly throughout the mass and enough is gently flushed to the surface for immediate finishing. Where the top-coat is put on as wet as mortar, or sloppy, the amount of moisture in upper and lower courses differs, and consequently the change in volume while setting is in different ratios. This is a fruitful source of checking.

There is one more cogent reason why the top-coat should never be put on sloppy. Sidewalks differ from some other kinds of concrete work in that the surface has to be finished by manipulation. If the finished surface is to be durable it should be finished as soon as possible. Now if the concrete is too wet the finisher stands around half an hour or so waiting for the surface to dry out enough for him to do his work. If

he starts to use his trowel while it is too wet he flushes neat cement to the surface and this, being the softest part of the mass, makes a scale that wears away easily if it does not flake off. If, on the other hand, he waits until the surface is just plastic enough he is bound to disturb particles that have begun to set and which for the sake of strength and durability should have been left untouched in their original positions. Is it not strange that in view of these simple facts, easily demonstrated in practice, the big city of Chicago should specify a sloppy top-coat for her sidewalk work?

A number of other minor fallacies in sidewalk work might be pointed out, but they are mainly local and not widespread. One of these, however, which I desire to refer to is the notion that it is necessary to leave the forms in place in sidewalk work until the concrete has set. There is no special objection to this, except that persistence in the idea may prevent a contractor from adopting some of the modern styles of forms, which are usually of steel and more expensive than the old wooden forms, and the outlay for which is reduced if each section of form may be used more frequently. Experience during the past few years with this style of form has shown this to be practicable without any detriment to the pavement.

AUTOMATIC STREET LIGHTING

At the annual meeting this year of the New England Association of Gas Engineers there was a brief discussion of the matter of automatic street lighting. One of the members stated that at Roxbury, Mass., the gas company has installed near the works 93 automatic lights, 43 of which were in use ten months and 50 of another type in use five months; the first named being without chimneys and the second with chimneys. The failures of these automatic lights averaged about 2 per cent, due to various causes, such as frost and inherent defects. The lights without chimneys averaged 1.7 mantles per month and those with chimneys one-half mantle, the breakages of the former being due in the majority of cases to the instability of the lantern itself and to the wind. The former lamps failed to light on an average of once every 54 days and to extinguish once in 150 days. In the other system the average was one lamp failing to light once in 63 days and to extinguish once in 39 days.

The lamps are lighted by pressure impulse from the governor house at the Roxbury station by putting on a momentary pressure of 6½ inches for lighting and 5½ inches for extinguishing. This impulse amounted to a pressure of 4.8 inches at a distance of ⅞ mile from the power house, but is slightly less effective during the winter. Where the impulse system is used it is necessary to take into consideration the fact that the holders nearer the works are apt to take up the impulse and make it less effective at greater distances. Aside from this, however, the impulses are almost instantaneous a few miles away, and lamps have been lighted six miles from the station. Impulses could be intensified by main and outside stations, operating simultaneously.

These lamps are sold under the trade name of Kilchman which is operated by a pressure impulse on a float in mercury and the Monand, which operates by means of a diaphragm which sets clock work in motion. The speaker stated that the experiments made at Roxbury indicated about two minutes as being the most desirable length of time for maintaining the impulse

CONCRETE PAVING IN KANSAS CITY

Kansas City, Mo., is paving roadways in residence street and alleys this year with concrete mixed and laid similar to the concrete foundation for brick and asphalt pavements, except that a little more care is used in tamping it to give a smooth surface and an even crown. No mortar is placed on top of the concrete. Expansion joints are placed every 25 feet. On some streets the curb is built at the same time as the pavement. The city expects to place about 12,000 sq. yds. of this pavement on streets at \$1.10 per square yard and the same amount of alleys at \$1.25 per square yard, including five-year maintenance

Concrete Methods

The older engineers who may read this will undoubtedly
recall the time 20 or 25 years ago when most engineering
schools taught that the only way to mix concrete was to make
a dry mixture and tamp thoroughly until the moisture was
brought to the surface. During the last 10 years practice in
this respect has changed greatly, and now a wet mixture is
preferred for perhaps the majority of structures. Another in-
stance of changed ideas in cement work is the nature of the
aggregate used, especially the sand or "fine aggregate." It is
no longer considered necessary to exclude all clay, some even
claiming that 5 per cent. of this is beneficial. Probably the fact
is that this amount is beneficial if in such form or such nature
that it will be distributed uniformly throughout the material,
but it is objectionable if it is not.

There are other minor points connected with the use of
cement and concrete concerning which ideas have changed, but

possibly none of these would seem more radical to the con-
struction engineer than the removal of the ban against re-
tempering concrete after it has begun to set. A faithful in-
spector is expected to watch this point carefully and see that
any concrete or mortar which has taken an initial set before
use is thrown away. For the same reason great stress is laid
upon the necessity of not walking upon concrete or masonry
after it is laid, dressing stones upon the wall, etc.; and an
argument advanced in favor of wet concrete has been that the
ramming necessary with dry mixtures is apt to break the set
of that below. In view of this it would seem to be revolu-
tionary to propose the use of re-tempered mortar or concrete,
and yet just this is being done by a conservative engineer of
the highest reputation. In the article in this issue describing
some concrete work at Rochester, a quotation is made from
the specifications which not only permits the retempering of
concrete for certain purposes, but requires it. This, of course,
was not done in order to favor the contractor, but because the
engineers believed that it would be of advantage to the work.
Their reasons for introducing this radical change and some
of the experiments upon which they were based will be the
subject of an article in next week's issue.

Under the heading of sidewalk fallacies a writer who has
had considerable experience in concrete work calls attention to
another old and almost universal practice in connection with
concrete work which he believes to be erroneous in principle
and unnecessarily expensive in practice. While we are not
quite ready to subscribe to his ideas concerning the undesir-
ability of cinders under concrete walks, we believe that they
are worse than useless where they are not underdrained or at
least will not drain naturally toward some low point from
which escape of the water is provided. At any rate the idea
is deserving of serious consideration, especially in view of the
hundreds of miles of concrete walks which are being laid every
year.

Asphalt Repairing in Reading

On August 1st of last year work was begun repairing asphalt
streets in Reading, Pa., with the use of a Hooke portable plant
which, with the necessary tools, cost \$598.70. Five men were
employed to operate the plant and work was continued until
the latter part of November, at which time a semi-portable
plant was leased from a contractor with the idea that the work
could be done with it more cheaply.

The work done by the portable mixer was very satisfactory
in operation, but where all new material was used the cost per
square yard was \$2.50. When it was found that the cost was
running so high it was decided to utilize the old material re-
moved from the streets, and patches were made using one-half
new asphaltic mixture and one-half old asphalt. With this
method of operation the cost was brought down to \$1.35 per
square yard for binder and wearing surface. There was a
source of loss in the use of this mixture, in the idleness of
the men while the mixture was heating, as it required 2½ hours
to heat a panfull of material to the required temperature, and
½ hour to empty and fill the pan again. To meet this objec-
tionable delay Mr. Ulrich recommends the purchase of a dupli-
cate plant in order that the two may be operated alternately.
This method he figures would make the operation of repairs
almost continuous without any increase in labor cost.

The semi-portable plant was started in operation on October
10th and continued until quite cold weather. The cost of
repairing by using this plant varied from \$1.20 to \$1.35
per square yard. "This cost is excessive for a plant of this
kind, owing to short time of operation and to the large number
of men employed, which latter was necessary as our asphalt
pavements were wearing out in far greater ratio than the re-
pairs were being made; and as the time of cold weather was
rapidly approaching it became essential to push the work as
speedily as possible, even at a slightly greater cost. With a
properly regulated plant of this kind, there is no reason why,
under conditions similar to those which existed this year, the

street repairs should exceed a cost of \$1.10 per square yard and the repairing of cuts \$1.20 per square yard. . . . In the economical maintenance of asphalt pavement it may be stated that whenever repairs are needed to 30 per cent of the surface area of any pavement the entire area should be relaid."

NARROWING MINOR RESIDENCE STREETS

Under this title we published last week an abstract of a paper by Charles Mulford Robinson before the Philadelphia Conference on City Planning. Mr. Robinson requests us to state that this paper summarizes two chapters of a book which is now in press entitled "The Width and Arrangement of Streets: A Study in Town Planning," which is being published by the Engineering News Publishing Company.

SEWAGE PURIFICATION AT READING

THE Reading sewage purification plant, which includes screening, pumping, sedimentation and final treatment on sprinkling filters, has been described by us. One of the more unusual features of this was the screen or, as it is called by the inventor, the segregator. This is practically a revolving screen with fine mesh, the sewage discharging into the interior of the screen and flowing through the openings, the suspended matter being strained out and retained within the screen, where it is gradually moved forward to the further end and dropped into a sludge pit. In his report for the year 1910 city engineer Edmond B. Ulrich makes the following statement concerning this appliance:

"During the year the segregator at the pumping station has been out of service 1,500 hours or an equivalent of 63 days of 24 hours each. In 1909 this figure was 77 days. It has been impossible to keep this device in sufficient repair to keep it in constant operation and, therefore, a second device in the spare pump well should be installed.

"During the year the screenings removed by the segregator have amounted to 31 cubic feet of wet solids per million gallons of sewage screened. These screenings contained approximately 90 per cent moisture. This high amount of moisture is an undesirable feature of the segregator, because screenings containing 90 per cent moisture give twice the weight to handle for the same amount of dried material as do 80 per cent screenings. The criterion for screening efficiency should be the thoroughness with which the larger suspended matters are removed and not only mere bulk of removed matters. All materials large enough to clog sprinkler nozzles should be screened out, but it is more economical and just as satisfactory to remove finer solids by sedimentation. The cost of screening has been about \$1 per million gallons of sewage, while the cost of sludge removed from the settling tank has been about 5 cents per million gallons."

In the operation of the sprinkling filters it was found that clogging in the top 6 inches of the filter material is most serious in later winter and early spring. As warm weather comes the accumulated solids are voided by the filters. During the past year there was clogging in the fall, which had not occurred in the two previous years, this being attributed to the increased rapidity of flow through the settling tank, due to the increasing amount of sewage, which increased the strength of the filter influent and made the burden upon the filter heavier. "This shows that the ordinary method of rating the capacity of sprinkling filters at so many million gallons per acre per day is both unscientific and impracticable. The rate depends upon the strength of the influent, the character of the filtering material, uniformity of distribution and atmospheric temperature. With the present strength of influent the filters can be operated at a rate of between 2 million and 2½ million gallons per day."

The riser pipes which carry the sprinkler heads in one of the filters projected about one foot above the surface of the material, because the contractor had failed to fill the bed to the intended depth. During the night of February 7 the temperature fell to minus 10 degrees and in the morning 75 nozzles were found frozen completely shut. In the other bed, where the filter material had been carried up to the end of the riser

pipe, not a nozzle was frozen. "This shows the need of the filtering material coming to the tops of the riser pipes, in order to keep these pipes from cooling off in times of extreme cold."

The effluent from the filters is clarified of the solids voided by the filters by passing it through sedimentation basins. These basins were cleaned seven times during 1910, the amount of sludge in one averaging 1.95 cubic yards per million gallons treated, that in the other 2.09 cubic yards. This sludge has from the first been disposed of by pumping it upon the area adjacent to the basins. It has very little odor and after exposure to the air becomes perfectly odorless and upon drying assumes a humus like consistency.

COST OF PARK MAINTENANCE

Hudson County, N. J., owns and maintains six parks, varying in area from 5.898 to 207.823. The total area of the six is 517.904 acres.

The largest of these parks, West Side park, contains 6.91 miles of graveled paths, 2 miles of driveway, 58 miles of open lawn and meadow, 2¼ acres of water area, 22 acres of planted area. During the year 1910 the cost of maintaining West Side park was \$34,048.02, or \$318.21 per acre. Some of the principal items of labor in this maintenance cost, with the quantities involved, were as follows:

Drives, 42,446 sq. yds. Cleaning, 1.4 cts.; repairing, 0.7 cts. sprinkling, 1.4 cts.; rolling, 0.7 cts.; total, 4.2 cts.

Paths, 50,940 sq. yds. Cleaning, 0.8 cts.; repairing, 0.5 cts. edging, 3.2 cts.; rolling, 0.2 cts.; total, 4.7 cts. per sq. yd.

Fields, 48 acres. Rolling, \$3.515; mowing, \$16.25; cleaning \$11.544; sprinkling, 16.9 cts.; fertilizing, \$1.281; reseeding and sodding, \$1.995; total, \$34.754 per acre.

Lawns, 10 acres. Rolling, \$1.40; mowing, \$88.75; cleaning \$64.749; sprinkling, 95 cts.; manuring, 60 cts.; reseeding and sodding, \$3.15; total, \$159.60 per acre.

Flower gardens, 500 sq. yds. Planting, 45 cts.; manuring 10.1 cts.; weeding, 20.8 cts.; watering, 1.8 cts.; total, 77.7 cts. per sq. yd.

Trees. Planting 49, 86.7 cts. per tree; manuring 8,000 trees 2.2 cts. per tree; watering, 44.8 cts. per tree; pruning 8,000 trees, 0.5 cts. per tree; spraying, 4 cts. per tree; falling 1 trees, 27.1 cts. per tree.

Playgrounds. Cleaning 2,280 sq. yds., 6.6 cts. per sq. yd. repairing, 3.2 cts. per sq. yd.; equipment, 25 pieces of apparatus \$2,770. Instructing, 95,600 visitors, 0.6 cts. each.

Guards for 107 acres, \$45.107 per acre; police, \$89.719.

The above items were for wages only. Under the head of supplies the amount necessary for repairing drives was 0.9 ct per sq. yd.; that for repairing paths, 0.5 cts.; for mowing field 51.5 cts. per acre; fertilizer for fields, 31.3 cts. per acre; seed 82 cts. per acre; seed for lawns, \$2.636 per acre; manure, 50 ct per acre.

Plants for flower gardens, 46.2 cts. per sq. yd.; trees, \$43.1 each; 25 pieces of equipment, \$237.27.

POLICE SIGNALS AND FIRE BOXES

In his latest annual report the chief of police of Reading Pa., Harry S. Levan, makes the following statement: "I can not speak too highly of the red light signal system. It has aided this department greatly in the apprehension of criminals. Many important arrests have been made through this system. It has been the source of dispatching men quickly to places where riot and gross disorder prevailed. The officers have been educated to such an extent in this signal system that they are constantly on the lookout for its glare, and it is gratifying for me to state that on a number of occasions I have been able to get at least seven men in three minutes' time, which proves that it is working very efficiently."

The Reading Fire Department has adopted the plan of painting a red band about three feet wide around all poles to which fire boxes are attached. This is done for the reason that some of these poles are so thick that the box cannot be seen from the sides. It aims to keep this paint bright and easily recognizable from a considerable distance.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

Street Repair Work Is Begun

Marion, Ind.—Street repairs in Marion have started on an extensive scale, and the city street cleaning department is busy from early morning until late at night. The asphalt manufacturing machine which was purchased by the city several years ago has been brought forth from its winter quarters and placed in position along Spencer Avenue near the end of Boots Street. A large number of workmen are in charge of the machine and the season's patch work has started.

Narrow Street Is Dangerous

Boston, Mass.—Complaints are frequent, particularly from automobilists, on account of the narrowness of Norfolk Street, in the Dorchester District. The street is no wider than an ordinary residence street and two car tracks have been placed in it. A pole line close to the curbing

Courtesy Boston Herald

A DORCHESTER STREET TOO NARROW FOR SAFETY

adds to the danger. There is barely room for an automobile or large vehicle of any kind between the track and curb, and when two cars are passing there is no other choice of roadway.

Mayor Inspects Street Work Done by City Forces

Philadelphia, Pa.—Mayor Reyburn has inspected the street repairs being done by the emergency repair corps of the Highway Bureau, under Commissioner Thomas T. Haines, who has 32 gangs at work on streets occupied by car tracks. There is a total of \$500,000 available for this work and the Mayor has declined to approve contract to a paving company, believing that the city repair gangs can do the work satisfactorily. "The work being done by the city's own forces is all right and so long as that condition prevails there is no need for awarding contracts," said the Mayor.

Citizens Will Give Land for Boulevard

Binghamton, N. Y.—If plans now under way materialize Binghamton will soon be given land for a handsome boulevard along the bank of the Chenango River. Frank B. Newell, who recently acquired a valuable property on Front Street, running to the river, has signified his willingness to deed to the City of Binghamton 50 feet from the rear of his premises to be used for a boulevard, providing his neighbors will give an equal amount. It is understood that Alonzo Roberson, another large property owner, will make a similar contribution, all being required that the city agree to lay out a boulevard along the river bank. The cost of a retaining wall would be small and with cement walks along the shore and seats beneath the large elms which overhang the stream, the boulevard would prove most delightful.

Viaduct to Be Open to Public June 1st.

Milwaukee, Wis.—Grand Avenue viaduct, which was described in the Municipal Journal on May 10, and around which there has been almost constant dissension, frequent clashes and at least one court suit, will be opened to the public on June 1, according to Chairman James Sheehan, County Board. Little remains to be done to place the viaduct in first-class condition, and this is being finished by the county under supervision of Engineer Gustav Steinhagen, despite the protest made by the National Engineering Company against the "arbitrary and unreasonable" action of the county. The east approach is completed with the exception of some little surfacing, and the west approach is nearly paved.

Plan Elimination of Grade Crossings in Pawtucket

Pawtucket, R. I.—A report has been made by a commission having the matter in charge to eliminate grade crossings in Pawtucket, at an estimated cost of \$1,220,247.

Courtesy Providence Journal

GRADE CROSSING TO BE REMOVED

The report, however, does not discuss the question of division of expense between the city and the New Haven Railroad. At the point shown in the plan, Broad Street and Railroad Avenue, the railroad tracks will be relocated, moved to higher ground and depressed. A new street, much needed, will occupy the present railroad right of way.

Water Scarce; Oil to Be Used on Streets

New Britain, Conn.—State Highway Commissioner MacDonald has notified Selectman Newton that he will ship a car tank of road oil here within the next few days to be used on the highways in town. The roads are at the present time in very poor condition as a result of the prolonged dry spell and Selectman Newton has requested the commissioner to send some oil here in the hope that it will improve them. Owing to the small amount of water in the reservoir rigid economy must be used to avoid a shortage this summer unless rain comes to the rescue, and consequently the roads cannot be sprinkled with it. The macadam is so dry that it breaks up easily under the automobiles which go through town at high speed, and unless something is done soon the highways will have to be resurfaced.

Will Try Oiling Streets

Waterbury, Conn.—The Street Department is just entering upon its long period of spring and summer activity. Grading is going on in several sections of the city and Superintendent Benjamin Chatfield has his plans all mapped out for the new departure of oiling the streets instead of depending wholly on water as a dust layer. The oil campaign will start within the next 10 days.

Leads in Mileage of Paved Streets

Kansas City, Mo.—With its 357.59 miles of paved streets and boulevards, Kansas City leads the cities of the country in its paving mileage, it is said. And practically every foot of it has been laid, and much of it relaid several times, since 1880. There was practically no street paving in Kansas City prior to 1880.

New Board Faces Serious Paving Problem

Chicago, Ill.—More than two-thirds of the streets in Chicago's downtown district are in bad condition, and Mayor Harrison's new board of local improvements is facing a huge task in carrying out the program for repaving these thoroughfares. Although the former board of local improvements paved more downtown streets in the last two years than had been resurfaced in the ten preceding years, much of the extensive work planned by the old board remains to be carried out by new men. The condition of some of the streets in the downtown district is declared to be "frightful." Old "turtle-backed" granite blocks, which were laid twenty years ago, still are doing service, a menace to traffic and a disgrace to the city. Inspection of the streets in the downtown district revealed that there are 123½ blocks of pavement in bad condition, either in need of repair or repaving. There are 36½ blocks of good creosoted wood block or asphalt pavement, exclusive of Jackson Street and Michigan Boulevard, which are under the jurisdiction of the South Park commissioners.

City Will Be Improved by Elimination of Grade Crossings

Youngstown, O.—The plans of the Erie grade crossing elimination were explained in detail by City Engineer F. M. Lillie at a recent meeting of the Engineers' Club. By the use of diagrams and maps it was shown how the completion of the proposed plan will give both the railroad and the city better grades. The total cost of the improvement is estimated after careful figuring at \$2,000,000. Under the law requiring the city to pay 35 per cent., the city's portion would be about \$700,000. The street railway, however, pays part of the city's cost, and Mr. Lillie said he thought \$500,000 would cover the city's share. It will be necessary to rebuild parts of several sewers because of the lowering of the tracks. Mr. Lillie mentioned the theory of elevating the tracks, which is advocated by some people, and said the Erie refused to consider that at all. He said he thought it was out of the question for Youngstown to consider an elevated road through the heart of the city also.

Refuse to Pay Twice for Paving

Rensselaer, N. Y.—Interesting developments are anticipated as a result of the action of the Rensselaer Common Council in authorizing a bond issue of \$145,000 to redeem the old bonds issued to pay for the granite block pavement in the old village of Greenbush. Property owners who have paid for the granite block pavement abutting their property are demanding exemption from paying for the new bond issue. They claim it is an injustice and threaten to take the matter to the courts before they will pay for the improvements the second time. Comparatively few of the property owners paid for the granite block pavement and the money realized from this source is to go toward paying for the new bond issue. It has been suggested that the citizens who have paid for the improvement be exempt from the proposed additional expense if it is necessary for a special act of the Legislature to bring about such a thing.

Mayor Persuaded 100-Foot Draw Bridge Is Necessary

Boston, Mass.—The necessity of consulting with the War Department officials on the construction of the Chelsea Bridge took Mayor Fitzgerald to Washington, where he spent the better part of a day. Mayor Fitzgerald will use his influence to have the city of Boston and towns in the neighborhood affected by the Chelsea Bridge appropriate the \$65,000 necessary to build a bridge with a 100-foot draw. Mayor Fitzgerald went to Washington to oppose the War Department's proposition that Boston raise \$65,000 for the Chelsea Bridge. He felt that that was too much money, but after he had talked with General Bixby he changed his mind. The general pointed out how far behind Boston was in the matter of bridges and how necessary it was to have the 100-foot draw.

SEWERAGE AND SANITATION

Sewer Work Halts; Fund Is Overdrawn

Minneapolis, Minn.—Sewer construction work has been ordered suspended all over the city because the main sewer fund is overdrawn \$15,000 at least. More than 400 men employed on the city's ditches must go without their pay for two months pending realization of funds on sewer bond sales. It is patent, say city officials, that the city council has ordered work begun to cost more than \$200,000 when but \$50,000 was available.

School Children Co-operate in Freeing City of Mosquitoes

East Orange, N. J.—The School Board and Board of Health, with the aid of school children, are co-operating in the work of mosquito extermination. The subject of Mosquito Breeding Places is given out as topic for school composition and the children are encouraged to hunt up breeding places and describe them, together with an account of the general theory of the relation of mosquitoes to disease. Each breeding place is reported to the Board of Health, an inspector is sent to investigate, and if the report is correct a prize of a dime is given to the scholar. The board has appropriated \$200 to carry on this work.

Gases in Big Sewer Exploded With Terrific Force

Defiance, O.—A terrific explosion of gas, the detonation of which was heard all over the business part of the city occurred one morning last week in the sewer main extending from First to Second Streets on Clinton. The greatest force of the explosion occurred at the corner of First and Clinton Streets, where the large manhole cover there was blown high into the air and broken in two. The street commissioner has ordered all sewer to be flushed in an effort to prevent a recurrence of similar trouble in the future.

Sanitary Subjects to Be Taught in Schools

Indianapolis, Ind.—Dr. J. N. Hurty, secretary of the State Board of Health, who has been using the common schools of the State, when possible, as a means of spreading the doctrine of disease prevention advocated by the State board, has prepared an outline of sanitary subjects for consideration by the teachers of the schools. The outline will be printed, and a copy placed in the hands of every teacher in the State by the time school opens next fall.

Must Cover the Meat

Indianapolis, Ind.—H. E. Barnard, State food and drug commissioner, has notified meat dealers who have stands at the city market, either to place cases for the protection of their meat displayed there or to show that they have ordered such cases. The corps of field inspectors spent last week, on market days, watching the meat stalls, and reported the necessity at once. Reports of shoppers with soiled hands handling the meat, of its being unprotected from dust and dirt and germs, were made to Mr. Barnard. Butchers who have stands in the city market house have demanded that the city put in a refrigerating plant, and uniform glass covered cases, despite the fact a city ordinance requires the butchers shall put in refrigerated cases at their own expense. Members of the safety board do not believe the City Council will appropriate this money, but are willing to assist the butchers in delaying prosecution by the State Board of Health, if possible. Mayor Shank is opposed to the appropriation, saying he sees no reason why the city should spend \$100,000 for a refrigerating plant for the accommodation of the butchers and fish men, who compose a small part of the total number of stand holders in the market. Butchers say if the city will start the plant they will pay increased rentals.

No Dairies May Be Established in City

Indianapolis, Ind.—The city Board of Health has decided on the enforcement of an ordinance forbidding in the future any person to own more than two cows in the city. The order is not to affect anybody who already owns more than two cows. This will prevent any new dairies from starting inside the city. While the ordinance has been in effect some years, it has not been enforced strictly, and there are several dairies in the city.

WATER SUPPLY

Vote for Municipal Control of Entire Water Supply

Niagara Falls, N. Y.—Pure water for the south end as well as the north end of the city is assured after the magnificent victory last week, when the water proposition to parallel the mains of the Western New York Water Company was carried by an overwhelming vote. The vote of the taxpayers shows in no mistaken terms that the entire water supply of the city must be under municipal control. The south end voters were just as emphatic in favor of the city laying mains in the streets now supplied from mains of the private company as the north end—a stinging rebuke to the company's claims of faithful service and its assertion that it was treating consumers fairly. It was a remarkable exhibition of the sentiment of the people. Men and women voted almost as a unit for spending \$360,000 to extend the city mains to the south end of the city.

New Water Main Bursts

Minneapolis, Ind.—The new 36-inch water main on Aldrich Avenue, put in service last week, burst, flooding basements of business places on Plymouth Avenue from Aldrich Avenue to Third Street. A torrent of water filled the street, rushing over curbs and sidewalks. Where the main burst a hole 20 feet deep, 50 feet long and 20 feet wide, was torn in the street, stopping traffic on the Plymouth & Bloomington Street car line. When the water was finally cut off sand two feet deep covered Plymouth Avenue from Aldrich to Lyndale Avenues. The feeder main extends from Camden Place to Lyndale and Hawthorn Avenues and was laid to supplement water pressure so as to serve a large portion of the city which has long lacked water in sufficient supply to cope with drought.

City Officials Inspect Source of Water Supply

Portsmouth, Va.—The members of the Portsmouth Water Commission, together with the members of the Norfolk Water Commission, are making a visit to the Lake Drummond Canal to inspect the proposed source of supply for city water for Norfolk and Portsmouth. The two bodies are the guests of Mr. M. K. King, president of the Lake Drummond Canal and Water Company. The result of the trip will largely determine the action of the two cities with regard to a new municipal water plant. It is understood that the Lake Drummond Company has made proposition to the commissions of the two cities, which looked upon as being very advantageous. The proposition is that a pumping station will be established on the banks of the Pasquotank River and that water from that river will be pumped into the canal. At this end of the canal another pumping station will be established and from this station the water will be pumped from the canal and delivered through pipes to the city under pressure. This relieves the Lake Drummond Company from getting water from Lake Drummond, there having developed some question as to the ownership of the lake, and gives them their water from a running stream. It also relieves the city of Portsmouth from the necessity of establishing an expensive plant to pump the water from the lake into the city.

Company Considering Plans to Increase Water Supply

New Britain, Conn.—To increase the water supply in the reservoir and thus ward off a water famine, of which there is grave danger within the next few months, unless there is considerable rainfall, the directors of the Plainville Water Company have under consideration the matter of installing a pumping station at Hamlin's pond. The officers of the company admit that the situation is getting quite serious and something must be done if a water famine this summer is to be avoided. The reservoir is a great deal lower at the present time than it has been at this season in any previous year and there is not near enough water in the lake to supply the needs of the town during the summer. The problem has confronted the company for some time and the officers feel that it can only be solved by using the water in Hamlin's pond. Orders have been issued forbidding the use of outside faucets while the storages are in operation and it is now the intention to notify the property owners that until water is more plentiful the use of outside faucets and hydrants must be stopped entirely.

Water Plant May Bring Litigation

Salem, Ore.—Although Mayor Lachmund has won out in killing the ordinance to authorize a bond issue for the purchase of the Salem water plant, it is said that there is a storm brewing due to break in a short time which bids fair to involve the city in litigation. It is rumored that the mayor plans to compel the present owners of the water plant to live up to the franchise and furnish the citizens of Salem with a pure and ample supply of water. If this cannot be accomplished by referring back to the agreement in the franchise granted the company the Mayor will try to secure ordinances to bring about the desired condition. Many of the people of Salem approve of the Mayor's action in vetoing the ordinance, while many others bitterly oppose his attitude. Whether or not the Mayor succeeds in forcing the company to furnish better water, many business men are desirous that the city own its water system, and several have stated they intend to work to this end.

Verdict Against City for \$25,000

Newark, N. J.—After deliberating for a little over an hour the jury in the suit brought by the Weidmann Silk Dyeing company against the city of Newark for damages sustained by the company through the diversion of water from the Passaic river by Newark, brought in a verdict of \$25,000. The Weidmann company had brought suit for \$100,000, and presented claims aggregating about \$75,000, the principal items of which consisted of \$17,000 for money expended in the laying of pipes and the erection of a filter, \$51,000 paid to the Passaic Water company for water, due to the fact that the dyeing concern could not take water for its purposes from the river, and \$5,000 paid to Mr. De-Gray for the use of his land in connection with the securing of water. The claim of the Weidmann company, was that these expenditures were made necessary through the diversion of water from the Passaic river, and that Newark was liable for such part of the expenditure as the diversion of water made by Newark bore to the whole diversion, or about forty per cent. of the amount.

Favorable Report on Water Supply

North Tonawanda, N. Y.—The report of the State hygienic laboratory on the water supply of Lockport, Tonawanda, and North Tonawanda for domestic purposes, which was completed last week, shows that the water supply now taken from the Niagara River for the three communities is the best it has been in years.

Purchase of Water Systems Is Urged

Portland, Ore.—More than 200 residents of Southeast Portland, most of them from the Mount Scott district, appeared before the Water Board recently and urged the early consummation by the board of the purchase of the Woodmere and the Woodstock private water systems. They declared they feared that if the final acquisition of the private plants was delayed much longer they would be unable to secure Bull Run water before the dry summer season, in which case they would suffer on account of shortage of water. In many homes, they asserted, they are now short of water and that conditions will become serious within a few weeks unless relief is given. They also asserted that there is much typhoid fever in the Mount Scott district, which they attribute to the use of water from the private systems which is obtained from wells. The board already has decided to purchase the Woodmere system for \$50,000 and this probably will be taken over June 1 and all the consumers provided with water at city rates. The Woodstock system has not yet been purchased, but members of the board are negotiating with the owners.

Water Supply Grows Short; Sprinkling Is Stopped

Dayton, Ohio.—Service Director Ely has ordered a stoppage of all street sprinkling. This action was taken after a conference of Safety Director Lienesch, Fire Chief Ramby and Service Director Ely. The officials do not wish to alarm the public, but the situation they are facing is considerably worse than it has ever been before at this time of year. The increase in the water consumption of the city over last year can be seen when the average consumption per day for May last year was 9,000,654 gallons, while it now averages above 12,000,000 gallons every day.

STREET LIGHTING AND POWER

Palo Alto Lighting Plant Lowers Rates

Palo Alto, Cal.—As a result of competition from the United Gas and Electric Company rates for electricity for lighting purposes have been reduced by the municipal plant from 10 cents to 7½ cents per kilowatt hour maximum and 4 cents minimum. For motor and power loads the rate for any quantity is reduced to 4 cents. For heating, cooking and household electric appliances the rate is reduced to 3 cents per kilowatt hour for any quantity. The reduction was made possible because of the monthly profits accumulating in the municipal plant amounting to \$2,000 to \$2,500 a month.

Satisfactory Report From Light Plant

Richmond, Ind.—Satisfactory returns from the Municipal Light Plant for the month of April were reported to the council meeting Monday evening. The total receipts were \$8,694.18, while the excess of receipts over the operating expenses was \$6,876.38.

Company Cuts Price of Gas

Tacoma, Wash.—Gas will be cheaper in Tacoma after July 1. Close on the heels of progressive moves that have followed one another so rapidly as to be almost continuous, official announcement has been made by Henry H. Hyde, general manager of the Tacoma Gas Company, that beginning about July 1 the price of gas will be reduced 10 cents per thousand cubic feet. Hereafter the price will be \$1.15 per thousand feet net, grading down as the consumption per meter increases. Hitherto the rate has been \$1.35 per thousand, but a discount of 10 cents per thousand is allowed on bills paid within two weeks after the meter is read, so that the gas consumer who pays his bills promptly has been able to obtain gas for \$1.25. The reduced price, however, will mean a saving of thousands of dollars to consumers in the course of a year.

FIRE AND POLICE

Motor Patrols Prove Economical

Detroit, Mich.—The Detroit police department has issued a statement bearing on the use of motor patrols in the police service for six months from October 1, 1910, to April 1, 1911. "The installation of automobiles in place of horse-drawn patrols has been remarkably successful in this department," says Police Commissioner Croul. "During the six months we have shown a saving of \$7,112.51 in favor of the automobiles and in addition we have derived most endless benefits on account of the greater speed and distance the automobiles travel."

Police Dogs Presented by Citizen

Cincinnati, O.—Two genuine police dogs, at present members of the Paris (France) force, will be sent to Cincinnati within the next few weeks as adjuncts to the local department. Safety Director Small has been offered the canines by Henry Ziegler, who is at present in France, and he immediately replied that the gift will be greatly appreciated. These dogs have been specially trained for their peculiar work, and those who have seen them on duty in Paris say they seem to possess almost human intelligence. They not only aid the police in making arrests and in locating criminals, but also guard the prisoner so that he will not make his escape. The two bloodhounds which the local department tried out some months ago did not come up to expectations, and consequently were not retained by the police.

Report Approves Work of Fire Department

Los Angeles, Cal.—The work of the fire department and the new high-pressure salt-water system at the blaze at Twelfth and Webster Streets recently was commended in a letter by W. J. Duval, district secretary of the Board of Fire Underwriters of the Pacific, read before the ordinance and judiciary committee of the City Council. A report from Mr. Duval was called for by the president of the board, in view of a request to the underwriters to lower the insurance rates. The report found that the work of the department was only handicapped by a lack of high pressure hose tenders.

New Police Motorcycle Sub-Station a Benefit

Toledo, O.—Since the new police motorcycle sub-station, which adjoins No. 4 engine house at Monroe and Bancroft Streets, was placed in commission, April 20, the efficiency of the police force has been increased to such an extent that Chief Perry D. Knapp has announced that he will recommend that similar sub-stations be established as soon as possible in the north and south sections of Toledo. At the new station, which is a one-story brick structure, equipped with desk, chairs and telephone, two motor patrolmen are stationed daily from 3 P. M. until 7 the following morning, working in 8-hour shifts. The men at the new station respond to calls and complaints from that section of the city west of Collingswood Avenue and the Air Line Junction district. In addition they go to all fires to which the firemen of No. 4 engine house are summoned, and when not

Courtesy Toledo Bl.de

POLICE SUB-STATION FOR MOTORCYCLE MEN

otherwise engaged one of the men patrols the streets in the vicinity of the station and tries the doors of business houses, while his partner remains in the station. In cases of emergency the men at the sub-station are assisted by motor patrolmen and detectives from police headquarters. "The speed with which motor patrolmen work," said Chief Knapp, "is of great benefit to the police department, and I hope soon to have the motorcycle squad increased so that two men can be kept on duty at the new sub-station every hour of the day and night."

Automobile Fire Engine Test a Success

Washington, D. C.—The new automobile fire engine sidled up to a fire hydrant in front of No. 2 engine house one day last week and went through its paces to the great delight of a large multitude. Several hundred thousand gallons of perfectly good water was squirted all over Fourteenth Street during the test, and many a coal cart driver, truckman and automobilist who tried to dash too close to the five-hundred-gallon-a-minute stream, emerged looking as if the clouds had broken loose upon him. The opinion of the officials who watched the test and took measurements is that the automobile fire engine is a success. Commissioner Rudolph, Commissioner Johnston, Chief Wagner, Fire Marshal Nicholson and T. M. Robinson, superintendent of machinery, were among the officials making the test.

New Automobile Engine Damaged in Accident

New York, N. Y.—The new automobile engine of the Fire Department was returning from a small fire in a tenement house when an automobile express truck ran into it at Fifth Avenue and 115th Street. The front wheels of the engine were broken and it was put out of commission. Dennis O'Connor, on the truck, was thrown to the ground and had two ribs broken.

Fire Chief Twenty Years

Paterson, N. J.—May 5 marked the twentieth anniversary of Chief John Stagg's being at the head of the paid Fire Department, and while he might retire on half-pay, he will continue in his present position until the new fire headquarters are completed and the automobile apparatus installed therein. Thus he will have seen the fire-fighting paraphernalia change from the days of old goose-neck engines throwing water through leather hose to the modern gasoline-propelled and driven apparatus.

GOVERNMENT AND FINANCE

Refuses Offices to Commission

Oklahoma City, Okla.—This city has two sets of contending municipal officers as the result of a refusal of the Mayor and city council to turn over the city offices to the newly elected Mayor and commissioners. Court proceedings will be brought by the officers-elect to secure possession of the offices. The holdover Mayor and council claim that the election by which a commission form of government was adopted was illegal.

City to Collect Franchise Fees

Spokane, Wash.—Commissioner C. M. Fassett is going to get after the public service corporations, with a view of forcing the collection of franchise fees which past administrations have allowed to accumulate. The commissioner has introduced a resolution, which was passed, instructing that a list of all public service corporation franchises be made, with amount of fees which should be paid to the city, how much of this has been collected and how much is still due. The street car and telephone companies, the Western Union, the Postal and a number of smaller corporations are included in the order.

Portland Inspects Spokane's City Government

Spokane, Wash.—Portland may adopt Spokane's plan of city government, according to Councilman George L. Baker of the Rose city, who is here examining the way the Inland Empire capital conducts its municipal affairs. "At the recent election," said Mr. Baker, "a charter commission was provided for with the idea of instituting the commission form of government. As a member of the council, which elects the commission, I am in Spokane to study what you have done and are doing. From reports I have heard the plan in your city is working beautifully."

Large Bond Issue Easily Carried

Oakland, Cal.—By better than the required two-thirds majority of the votes cast, the people of Oakland recently passed the three bonding propositions presented for their consideration, thus taking another big step in placing Oakland in the forefront of western municipalities. The bonds carried by about a 2½ to 1 ratio and are for school buildings and an auditorium building, the latter to cost \$500,000. The total amount of bonds authorized by the election is \$2,993,700. In addition to the increased school facilities and many things in favor of the city owning the big convention hall, there is an additional advantage in the passage of the bonds—that of increased property values in those sections of the city where improvements are contemplated under the various issues. This is an immediate gain to a large number of Oakland residents and a prominent factor in the adoption of the bonds. The individual outlay in the slight increase in taxation is more than compensated by this one feature alone.

City Borrows Half Million at Lowest Rate in Its History

Birmingham, Ala.—At a meeting of the Commissioners one day last week, the city borrowed \$500,000 from the Birmingham Trust and Savings Company at the lowest rate ever given Birmingham in the history of the municipality. A loan was made bearing interest at 3¾ per cent. for four months at the discount rate. The offer to lend Birmingham money at such a low figure is taken to be a splendid tribute to the integrity of the city and the personnel of the commission. In commenting on the loan one of the officers of the Trust Company said: "The figures laid before us that Birmingham owned \$1,000,000 were sufficient to discourage almost any banker. However, our bank had faith in the integrity of the Commissioners, their determination to get Birmingham on a financial basis and their serious task facing them. We have been fully informed of the condition of Birmingham financially. From the figures Birmingham will be in good shape within a short time. We took the view that all interests here should co-operate with the Commissioners. Our institution always endeavors to connect itself with the best interests here. We did not fail to grasp the fact that the Commissioners needed every assistance that could be rendered by the people of this community."

STREET CLEANING AND REFUSE DISPOSAL

Watervliet Will Clean Up June 12

Watervliet, N. Y.—The Municipal Improvement League of Watervliet has selected the week beginning June 12 for the annual clean up and the Executive Committee is working on the general plan. As Mayor Hanratta has already come out in favor of the movement when the committee meets with him he will ascertain in what respects the league will expect the city authorities to help. The Mayor has said that he believed that everybody should assist in this matter and is willing to have the police and firemen help. The general plan calls for the division of the city into districts by wards. The Chairmen of the Ward Committees are to secure the services of enough aides so that one man may look after a block. It is not likely that the league will give any prizes this year.

Night Removal of Garbage Indorsed

New York, N. Y.—Asserting that his experiments in collecting ashes and garbage in the night had been successful, William H. Edwards, Commissioner of Street Cleaning, has recommended to Mayor Gaynor that the night plan be adopted in the five boroughs. He said citizens, civic bodies, boards of trade and other organizations had given hearty indorsement to the system. Night collection, he said, would cost more, but the benefit to horses and men, particularly in summer time, would be worth the expense. The Commissioner's letter to the Mayor, in part, reads:

"Very few complaints have been registered, and those were based on noise. Conditions in this respect cannot be expected to be perfect at first. We have the hearty co-operation of citizens and various organizations. This system should be extended. It will undoubtedly cost some extra money, but the conditions which are improved under this new system warrant the expenditure."

The Commissioner says the system is the most successful one that had ever been undertaken in his department. The nuisance of ash dust flying in the air and the unsightly removal of garbage, are done away with, and the streets and sidewalks made more presentable in the day time.

Starts Free Collection of Garbage

Beaver Falls, Pa.—Having once come to a definite decision on the garbage question, the members of the sanitation committee lost no time in starting the good work. At the last meeting of Council it was decided to gather garbage free and this committee was instructed to procure several one-horse wagons and start the good work.

Garbage Reduction Company Sues City

Dayton, Ohio.—The City is involved in a law suit with the Dayton Reduction Company and has appealed from a judgment the company secured in the sum of \$79,000 for failure to furnish the Dayton Reduction Company as much garbage as the city had rashly bound itself to furnish in a rather absurdly framed franchise. Later \$89,000 more was demanded of the city, raising the total obligation alleged to be approximately \$160,000. The second part of the suit, that calling for an additional \$89,000, is now pending in the Common Pleas Court.

Clean-up Day a Big Success

Montgomery, Ala.—"Clean-Up Day" was a success far beyond the expectations of the officials of the sanitary department of the city. Throughout every section of Montgomery both sides of the streets were dotted with metal receptacles, barrels, boxes and devices of all descriptions, which contained one of the most varied assortments of refuse and rubbish that could be found in any city of the size of Montgomery. With one accord the people co-operated with enthusiasm with the sanitary department in making "Clean-Up Day" the best Montgomery ever had and they were successful. School children were given a package each of disinfectant to sprinkle around their homes, and Wednesday noon about 2,500 pounds of it had been sent out by the sanitary authorities.

Street Oiling Is Proving Popular Dust Preventive

Altoona, Pa.—Employes of the highways department this morning began the work of cleaning off the loose dirt from Fifth Avenue between Tenth and Eleventh Streets, preliminary to oiling the roadway as per an agreement entered into between the city and the property owners, whereby each shall pay half the cost of the oiling. Other streets have already been treated.

RAPID TRANSIT

Electric Lines Will Soon Be Completed

Burlington, N. C.—The management of the Southern Traction and Power Company has announced that contracts have been given for the completion of its electric lines for the city of Burlington and extension to Graham and Haw River, and that cars are to be in operation July 1. Work on this line was practically completed a year ago, when matters were tied up in court. All legal complications have been adjusted.

Motor Busses to Take up Passenger Traffic

Indianapolis, Ind.—A company capitalized at \$150,000 has been organized in Indianapolis for the operation of regular automobile passenger service in Meridian street, from Monument place to Thirtieth street. It will be a competitor of the street car lines in Illinois and Pennsylvania streets and the fare probably will be placed at 5 cents. It is planned to put six cars in service. If the Meridian street line is a financial success the company plans to extend the service to other parts of the city.

Considering Consolidation of Lines or 50-Year Lease

Boston, Mass.—A new and important alternative for the proposed consolidation of the Boston elevated and West End street railway properties is now before the legislative committee on street railways. The bill for the consolidation of the properties on which the joint commissions made report to the legislature is still before the committee. The controversy relative to the dividend rate to be assured the West End stockholders has been the most important issue. Instead of the proposed consolidation the committee is now considering the alternative of substituting a 50-year extension of the West End lease at $7\frac{1}{2}$ per cent. on the West End common stock.

To Build its Own Subways

Chicago, Ill.—Chicago's policy regarding construction of proposed subways under the present administration has been agreed upon. At the suggestion of Mayor Harrison, who took part in the discussion, the Council Committee on Local Transportation placed itself on record as favoring absolute municipal ownership of the subways, the construction to be paid for entirely by the city without aid from the traction companies or any other outside source. The decision was regarded as a blow to all advocates of subway construction by private capital.

Trolley Line Gets Franchise

Salt Lake, Utah.—By an unanimous vote, the Davis county commissioners have granted to the Utah Light & Railway company a franchise for a street car line from North Salt Lake through Bountiful to Centerville. The city council at Bountiful has already granted the company a franchise through the town, and now a committee of prominent citizens is going before the officials of the street railway company with a request that the proposed extension be built at once.

City Fight on Trolley Service

Jersey City, N. J.—Trolley traffic conditions in Jersey City were discussed at length at a recent conference in City Hall and further plans were made for the appeal which is to be presented to the Board of Public Utility Commissioners urging that body to exercise its rights under the new law and enforce adequate trolley service. The conference was called by Police Commissioner Job Lippincott, who recently assigned detectives on the job of carefully noting the overcrowded trolley cars and incorporate their observations in affidavits. It was decided to employ six citizens to follow up the findings of the detectives, to corroborate their discoveries and back up their statements to the Board of Public Utility Commissioners. The cumulative evidence is expected to accomplish some real results. "The appeal to the Utility Board," said Commissioner Lippincott, "is the quickest way to end the intolerable conditions on the Jersey City trolley lines." Mayor Wittppenn suggested that an engineer be engaged to look over the situation, suggest a system of trolley loops and prepare himself to contest any engineering objections that may be offered to the citizens' demand for more trolley cars.

MISCELLANEOUS

Proposes Bond Issue for New Playground

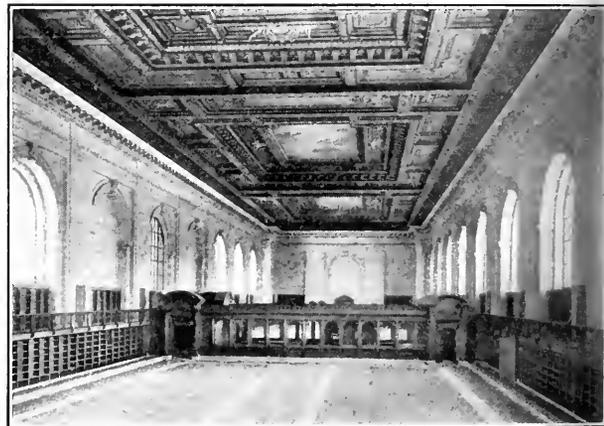

Dayton, O.—Dr. Lefkowitz and Dr. Curtiss interviewed Mayor Burkhart recently about the chances of a bond issue campaign to provide an extensive addition to the city's playground facilities carrying with the people. The Mayor proposed that the campaign be instituted with the Chamber of Commerce.

Park Playgrounds Are in Full Swing

Rochester, N. Y.—With the park playgrounds in six of the city parks open, the Children's Playground Association started in the fifteenth season of the work that it does for children who are forced by circumstances to spend the summer in the sweltering streets of the city instead of in the cool shade of the countryside. Four playgrounds opened last week, two were already open and two more will be placed in commission as soon as necessary arrangements can be made.

New York's Public Library Opened.

New York, N. Y.—The New York Public Library, was opened on the 23rd with impressive ceremonies, in which participated the President of the United States, the Governor of the Commonwealth, the Mayor of the city and distinguished civil and religious dignitaries. Noted scholars, artists, scientists and educators were in the company of five hundred which gathered in the vestibule for the exercises of dedication and at the public reception which immediately followed six thousand persons, representatives

DELIVERY ROOM, NEW YORK LIBRARY

of the metropolis, traversed the corridors of the great structure and inspected its manifold beauties. Other libraries in the world, as Mr. Taft pointed out in his address, exceed this which is given forever to the people, but none excels it in the manner in which its contents are made available for the education of mankind. Erected at a cost of \$10,000,000, standing on ground appraised at double that sum and containing almost priceless treasures of literature and art, it is a fane which millions of pilgrims are to visit in years to come. The accompanying illustration of the delivery room and desk is typical of the general style of the interior of the building. The finish is oak and the mural decorations are rich in coloring. The panels on the ceiling represent sky and clouds.

New Housing Code

Columbus, O.—Columbus took a long step forward recently when the City Council passed a housing code which is a distinct advantage over the housing regulations of any other American city. If properly maintained and enforced it will add much to the beauty as well as to the healthfulness of the capital city of Ohio. The distinctive point of the code is that it regulates the construction and use of dwelling houses as well as of tenement houses, guaranteeing to the tenant a minimum standard of light, air, water, toilet facilities and general sanitary conditions.

Citizen Offers Electric Sign Ordinance

Toledo, Ohio.—An ordinance pertaining to electric light signs has been presented to the City Council by Safety Director Mooney and was referred to the committee on ordinances. Mr. Mooney explained in a letter accompanying the ordinance that it was presented to the building inspector by a citizen, who was interested in the better regulation and maintenance of signs. Director Mooney also explained that the ordinance does not comply with the underwriters' rules and would affect insurance rates. It also permits signs in alleys, a condition which the city abolished after a hard fight. The ordinance places all signs under the jurisdiction of the building inspector, provides for annual inspections of electric signs, with a fee to cover the cost of these inspections, the number of lights to be used in signs of various sizes and makes signs in alleys possible.

Civic Association Plans Safe and Sane July 4

Tampa, Fla.—At the regular meeting of the Tampa Civic Association held one day last week a resolution was passed endorsing the campaign being made by the press and civic organizations of the country for a "safe and sane Fourth of July," advocating a celebration that will not endanger human life and limb in giving vent to patriotism.

Playground Work Is Taken Over by a City Commission

Worcester, Mass.—Work that is being done for the young folks of Worcester under the parental care of the municipality was shown at the meeting of the city council last week, when the ordinances were amended to provide for the appointment of a playground commission which will take over and continue the work that was started last year by the public playground association under the leadership of George F. Booth as president and Rev. Dr. John J. McCoy, pastor of St. Anne's church, as one of the prime movers. In appointing his municipal playground commission under the new ordinance, Mayor Logan showed his appreciation of the work done by the private association by making Mr. Booth a member for five years and Rev. Dr. McCoy a member for four years.

Neglected City Park is to be Beautified

Leavenworth, Kan.—After several years of neglect, the city park, Seventh and Spruce streets, is to be beautified this summer at the petition of residents of that part of town. Workmen are engaged now in repairing the fountain and raking rubbish from the place. They will plant flowers there and mount two bronze cannon souvenirs of the Civil War, given to the city by an act of Congress. Work will not stop then, according to Charles T. Cox, commissioner of parks and public property. Prisoners will keep the grass cut and keep the little triangular lot orderly through the summer.

Planning Trade School for Girls

Worcester, Mass.—The practical value of the work done by the boys in the Worcester industrial school is shown by the plans of the trustees in connection with the establishment of a trade school for girls. The trustees intend to have the new school ready for use in September if the \$6000 they have asked from the city council is appropriated.

Street Trees for Whole City Chosen

Pasadena, Cal.—The advisory committee on street tree planting has announced its last list of official street trees for every street in the city. Unless something has been unintentionally overlooked, an official tree has been designated for every street and avenue in Pasadena. The city will plant out the proper trees as fast as it can do so. In the meantime, those who wish to plant on their own account must observe the prescription.

Call Box for Sunday Mail is New System

Indianapolis, Ind.—A change in the system of Sunday delivery at the Indianapolis postoffice has taken place. Call boxes for that day have been established at the local office. This is the first postoffice in the country to try the call box system, which was suggested locally. By the new plan patrons of the office who rent "Sunday boxes" may get their mail at any time from 4 o'clock Saturday afternoon to 6 o'clock Monday morning.

Park Land Donated to City

Harrisburgh, Pa.—Mr. Isaac Freed has turned over to the Park Commission another link in the chain of river front parkway. The tract of land is 125 feet long and about 90 feet from the western line to low water mark. It is already parked to conform with the other river front parks. In 1892 Mr. Freed planted some handsome trees, and he has cared for the property every since to such good effect that it will become a part of the park system without any work being necessary by the Park Commission. Every year the property has been assessed for taxes and they have been paid by Mr. Freed. Members of the Park Commission, in announcing the gift, expressed their satisfaction with the generosity of the donor.

City Chemist's Department Inaugurated

St. Paul, Minn.—The city gas inspecting department is now a matter of municipal history, Mayor Keller having terminated its existence. At the same time he began the organization of the city chemist's department, authorized by the last Legislature. Victor Koehrich, chief gas inspector in the old department, was appointed city chemist in the new department. The work of the new department will be the testing of cement, asphalt, coal, paving and other materials used by the city in the making of public improvements. Gas and electric current used by the city will be tested, and probably street lights will be inspected. Among the first tasks to be undertaken will be the preparation of specifications for coal purchases on the B. T. U. basis, and specifications for city lighting.

City Declares Bill-Board War

Leavenworth, Kan.—The first step in what is expected to be an extended crusade against the bill-board nuisance in Leavenworth was taken before Judge Wendorff in the district court when Benjamin F. Endres in behalf of the city asked a temporary injunction against David Atchison, to restrain him from completing a board at the intersection of Fourth and Miami streets. The case was temporarily disposed of by the defendant promising to discontinue construction of the bill-board, pending the finding of another site for it. The specific reasons as set forth in the city's complaint for its cause for action were that, in the first place, the defendant had not secured a permit for the construction of the bill-board, as required by a city ordinance. Then, too, it was set forth that material being used in the work was of such inferior quality as to make the completion of the board dangerous to pedestrians.

City Will Receive War Memento

Birmingham, Ala.—Congressman Richmond P. Hobson, the hero of the Merrimac, is going to give Birmingham a conning tower. A letter has been received by the commission from Captain Hobson, in which he says the conning tower from the wrecked gun-boat Isla de Luzon, sunk by Admiral Dewey in Manila bay, is ready for Birmingham. The memento of the fearful sea battle at Manila was secured by Captain Hobson for Birmingham after it was reconstructed at Hong Kong. It is the suggestion of Captain Hobson to set the conning tower in a public place in Birmingham similar to the cannon from a battleship secured from the Cuban campaign.

City Officials Visit Adjoining Town to Inspect Playgrounds

Perth Amboy, N. J.—Accompanied by Mayor Bollschweiler, President C. C. Baldwin and Commissioners George F. Reynolds and Armin Tomaschoff, of the playground commission, visited New Brunswick recently to see what progress that city has made in the playground idea. The park commission of that city has donated a park to the playground commission about 200 by 500 feet, which is used as a playground site. Highland Park was visited where the private playgrounds of Watson Whittlesey were visited. The arrangement of the grounds attracted much admiration of the local officials and may be put into effect in this city. Next week the playground board will visit Morristown, where it is understood that considerable progress has been made with the idea. Mayor Bollschweiler, who accompanied the commissioners, is highly enthusiastic over the proposition for playgrounds in this city and stated that he would do all in his power to assist in the work.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Removal of Snow from Sidewalks—Obligations

Jefferson vs. City of Sault Ste. Marie.—It is a fact of common knowledge that a snowplow does not and cannot clear the walk in the center as well as it does at the edges where people have not trodden. A city is not liable for injuries from slipping on an icy sidewalk resulting from the fact that a snowplow belonging to the city, after passing over the walk, left a ridge of snow and ice which had become compacted by the tread of pedestrians or congealed by the dripping of water from buildings; the city being under no obligation to remove snow and ice from its streets.—Supreme Court of Michigan, 130 N. W. R., 610.

Assessments—Relevy—Laches

Byron Reed Company et al. vs. City of Omaha.—If the taxing officers of a city of the metropolitan class fail for more than ten years to relevy a special assessment after it has been adjudged invalid, or after other like assessments in the same district have been adjudged invalid for a reason that will control all the assessments levied at the same time, the delay will estop the city from relevying the assessment upon lots that have been transferred subsequent to the date the original assessment was levied, unless for some lawful reason the owner of the property is estopped to avail himself of the defense of laches.—Supreme Court of Nebraska, 130 N. W. R., 748.

Ordinance—House Moving—Electric Wires

Edison Electric Light & Power Company of St. Paul et al. vs. Blomquist et al.—St. Paul city ordinance, March 31, 1910, requiring electric light and power companies, telephone, telegraph and street railway companies at their own expense to remove or displace their wires lawfully in the street when a licensed house mover permitted to move a house through the streets requests them to do so, is invalid, in so far as it requires such companies having acquired the right to erect and maintain their poles and wires in the streets to cut or remove the same at their own expense to permit the moving of buildings, as a taking of private property for a private use.—United States Circuit Court, 185 F. R., 615.

Contracts—Power of Council

Audit Company of New York vs. City of Louisville et al.—A city had for several years owned all of the stock of a private water company which had been purchased from its sinking fund, and, as a preliminary step to the formal taking over of the property and operating it as a city department, its council by a joint resolution directed an investigation of the company and authorized the employment of experts and accountants for the purpose. Held that, although such action involved the expenditure of money raised by taxation, it was not governmental, but was the act of a proprietor with respect to property acquired for business and not governmental purposes, and that as such the delegation of authority by the resolution to the mayor and a commission to contract for the work directed to be done was within the powers of the council.—United States Circuit Court of Appeals, 185 F. R., 349.

Charter Construction—Initiative and Referendum

Rushton et al. v. Handley, City Clerk of City of Los Angeles.—City Charter of Los Angeles, permitting amendments to an initiative petition after the expiration of a certain number of days, in case the petition is found insufficient, is inapplicable to a petition to invoke a referendum with reference to an ordinance already passed, notwithstanding section 1, providing therefor, declares that the petition shall be in all respects, etc., in accordance with the provisions of the former section; and shall be examined and certified by the clerk in all respects as therein provided, since such provision refers solely to the form and substance and certification of the original petition.—Court of Appeal, California, 115 P. R., 56.

Highways—Public Easements—Right of Owner of Fees

In re Opinion of the Justices.—The public acquires an easement in the land of a highway, including a right to occupy the same for every kind of travel and communication of persons and every movement of property that is reasonable and proper in the use of a highway; but, subject to this right, the owner of the fee retains his ownership of every valuable interest in the land, and he may use it in any way not interfering with the rights of the public.

The Legislature may enlarge or limit public rights acquired in public highways, having due regard to private rights of property secured by the Constitution, and the Legislature may confer on municipalities the power to erect structures across public streets, or to permit individuals to erect structures bridging public streets; but the Legislature may not, without the consent of the abutting owners, take away any valuable right in their property, except for a public use and on compensation made.

The Legislature may authorize a municipality, owning the premises on the opposite sides of a street and the fee of the street, to erect a bridge across the street.

Where land over which a bridge across a street is to be built belongs to a private person, the bridge can be built without his consent only by paying him compensation, and then only for public purposes, as distinguished from an existing or intended use in a private business.

The Legislature may confer on any municipality the power to grant permits to individuals to erect structures which will bridge a public street connecting premises owned on both sides of the street, provided the individuals own all the land on or over which the structures are to be erected.

The Legislature may confer on any municipality the power to grant permits to bridge public streets connecting premises on opposite sides, subject to revocation at any time, and subject to the payment of rent to the municipality.

An abutting has, as against the easement acquired by the public for travel and communication, the right to have the street open for light and air, so long as there are no uses affecting his enjoyment of light and air to which the public desires to put the street, under the easement acquired by it.

Where the Legislature authorizes the imposition of an additional burden on property abutting on a public street for a different kind of public use, which will interfere with the abutting owners enjoyment of light and air, by erecting structures on or over his land within the limits of the street, he is entitled to compensation.

One has no right to have adjacent premises remain open for the admission of light and air.—Supreme Judicial Court of Massachusetts, 94 N. E. R., 849.

Covenant to Pay Public Taxes—Construction

J. W. Perry Company and John L. Roper (Plaintiffs in Error) vs. City of Norfolk, Va.—The covenant of a perpetual leaseholder with his municipal lessor to pay the public taxes which shall become due on the land embraces municipal taxes whenever they can thereafter be lawfully assessed on the land or the improvements which are part of the land, although when the lease was made the municipality had no power of taxation.—United States Supreme Court, 31 S. C. R., 465.

Taxation of Municipal Waterworks

In re Village of Delhi, Delaware County.—Though under tax law exempting from taxation the property of a municipal corporation held for public use except the part of municipal property not within the corporation, a municipality owning and maintaining a water works plant, a part of which is a tract of land partly within and partly without the corporation, is not subject to taxation on the land within its limits, but the part outside the limits is subject to taxation, an assessment of the entire tract is not void on its face, nor a manifest clerical or other error, but it is an illegal and improper assessment so far as it includes the land within the village; and hence where the municipality, with knowledge of the facts, paid the tax for several years without protest, it was not entitled to recover the taxes paid. The property of a municipality acquired and held for public use is not subject to taxation within the tax law, unless specially included.—Court of Appeals of New York, 94 N. E. R., 8731.

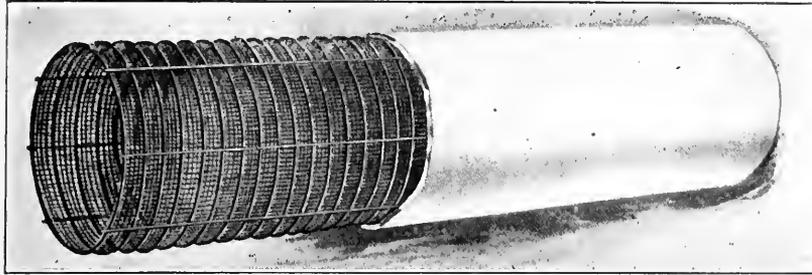

MUNICIPAL APPLIANCES

Sewer Pipe with Hy-Rib Reinforcement

The Trussed Concrete Steel Company, Detroit, Mich., manufacture a sheet steel reinforcement which may be used in the manufacture of sewer pipes and conduits. Hy-Rib is a steel sheathing stiffened by rigid high ribs. The ribs and lath are manufactured from a single sheet of steel. This re-

streets, and even more in parks, are often injured by the heat and smoke from a steam roller. The gasoline roller does no damage.

The contractor's engine made by this company is built very heavy to meet the requirements of road building, plowing up old streets and for extremely hard work. It is geared to move a trifle slower than the regular engine,

SEWER PIPE OR CONDUIT REINFORCED WITH HY-RIB

inforcement is furnished in three thicknesses of metal, represented by U. S. Standard Gauges Nos. 28, 26 and 24. Standard lengths are 6, 8, 10 and 12 feet. Four-rib Hy-Rib is bent in the shops to any desired arc of circle with radius varying from 13 inches to 20 feet. The shop-bending is said to insure absolute accuracy and smoothness of curve and avoids the necessity of expensive special field labor. In constructing a conduit or sewer a few rods, as shown in the illustration, extending the length of the conduit, should be provided to keep the Hy-Rib straight in line and as an additional safeguard against any shrinkage and temperature cracks. Either side of the reinforcement may be plastered first.

Petroleum Tractor-Roller

A COMBINATION gasoline or kerosene driven contractor's traction engine and road roller is made by the Ohio Tractor Manufacturing Company, Marion, O. The use of a petroleum product for motive power for a contractor's traction engine has an advantage as compared with steam in that the troublesome problem of supplying water for the boiler is eliminated. For use in a city as a roller or tractor it has a special advantage in that it avoids the smoke nuisance. Trees in city

has extra wide face gearing, large diameter shafts and axles, extra heavy drive wheel rims, bearings of the loose-running shafts are lined out with brass bushings, and everything is made to insure strength and long life.

The tractor-roller is the same machine as the contractor's engine. The front wheels of the machine are made regular, but are easily and quickly removed, and a roller of good weight and rigid construction, built upon its own frame, takes the place of the regular axle and wheels, thus changing the machine from a tractor to a practical roller in a short time. The maximum width of the machine in 45-horsepower size is 9 feet when 24-inch drive wheel is used. The drive wheel stands 68 inches to 72 inches and the front roller 37 inches. Weighs complete 12 tons. This is also built with an 84-inch drive wheel, the front roller standing 45 inches, and when built in 70-horsepower tractor, weighs 15 tons. With the large wheel and roller the 45-horsepower weighs 13 tons. When built from the 30-horsepower tractor, weighs 10 tons.

The general construction of the operating parts of the engine are shown in the illustration, which is of the regular traction engine. The cut shows the engine, hub, friction pulley, friction shaft and bearings of the same, the flywheel and its relation to the friction

drive and steering gear. The internal friction wheels are located and hung on pivoted bearings between the hub and rim of engine flywheel. These friction wheels transmit the power from the engine to the traction gearing. They occupy a neutral position and are brought in contact with the rim of the flywheels for the forward motion and against the hub of the flywheel for the backward motion.

Iron Fences

THE Vulcan Company, Detroit, Mich., manufacture plain and ornamental iron and steel fences, as well as other architectural iron work, in many designs. Standard designs of fence are made with extra heavy channel steel rails, into which pickets are calked by pneumatic power. This construction is much superior to the old construction of light channel rails and hand calking. Adjustable connections are provided at the ends of each panel, allowing of adjustment to meet the expansion and contraction of the metal, due to different weather conditions. These adjustable features allow of perfect alignment at all times. Adjustable center supports are placed under

LINE POST

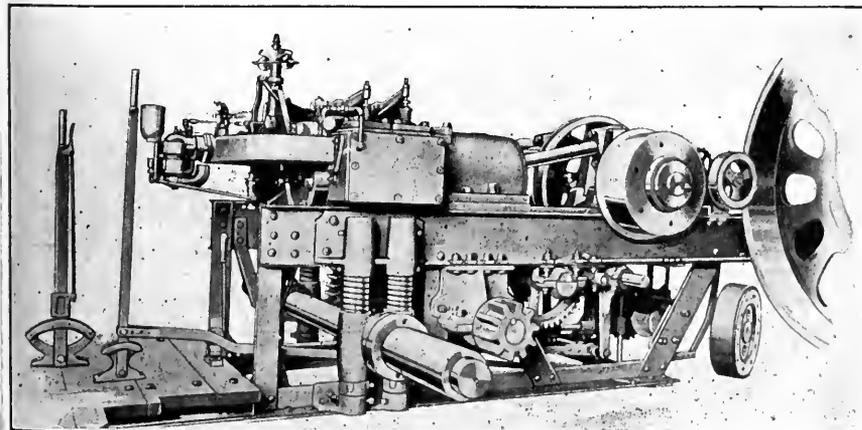

the center of each standard panel of fence, making it more substantial and keeping it in line. All picket heads, rosettes and connections used in the construction of Vulcan fences are made of the best malleable iron. In selecting fences for municipal purposes, surrounding reservoirs, parks and public buildings it is desirable, for reasons of economy, to select standard heights. The height is measured from the ground to the top of the picket, allowing the fence to stand three inches from the ground.

The illustration shows an ordinary standard picket used as a line post with a patented Vulcan foundation base. The base is connected to the picket by an adjustable brace clamp. The foundation is heavy and substantial. The picket and base have a common bed plate. This is movably attached to a table at the top of the base piece. When the picket is accurately set to line a bolt is tightened and the picket is held rigidly in place.

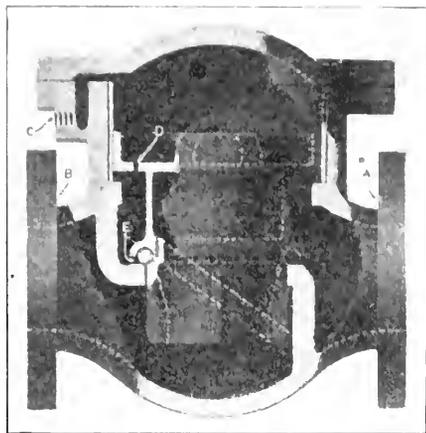

Fences made of pickets similar to that shown in the cut, where the rod is $\frac{3}{8}$ or $\frac{1}{2}$ round or square, are made in standard heights of 37, 42 and 48 inches high, when set as described. Pickets $\frac{3}{8}$ or $\frac{3}{4}$ inch in diameter, or square, are made in standard sizes of 37, 42, 48 and 60 inches in height.

Tubular fencing, suitable for bridges, with ball fittings, comprise another line of goods. They are made ordinarily with two or three rails of $1\frac{1}{4}$, $1\frac{3}{8}$, $1\frac{1}{2}$ and $2\frac{3}{8}$ -inch diameter.

For the construction of plain or ornamental entrances for public grounds this company offers a variety of styles to harmonize with the kind of picket chosen for the fence. If cement gate posts are desired the Vulcan Company can offer a number of designs which will look well with the fence. Any good carpenter, they state, can make the forms. Gates are made to match design of fence selected. Walk gates are 3 feet 2 inches wide between posts; drive gates 8 feet 6 inches.

WORKING PARTS OF PETROLEUM TRACTOR ROLLER

VALVE FOR MAINTAINING WATER LEVEL

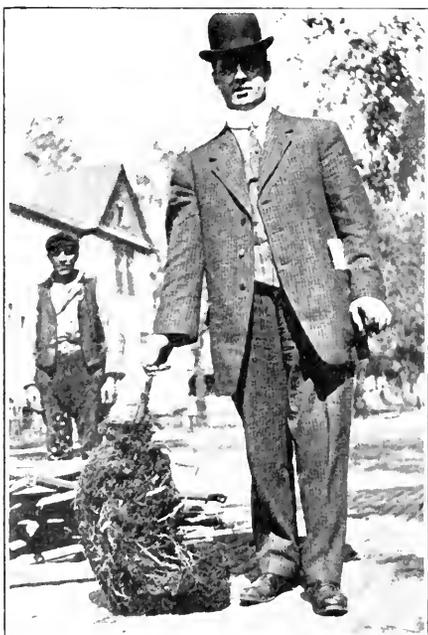

Paper Drinking Cups

The American Water Supply Company, 118 East Sixteenth Street, New York City, manufacture sanitary paper drinking cups. During the last year or two they have come into extended use as a result of the action of the boards of health of many states in prohibiting the use of the common drinking cup. The cups are made in folding and open patterns. They are strong and rigid, as the paper of which they are made is of a special manufacture, treated with paraffine.

Sieben Sewer Cleaner

The accompanying reproduction illustrates the work that may be done with the turbine sewer cleaner made by the Sieben System of Sanitation Company, Kansas City, Mo. The compact mass of tree roots was recently removed from a sewer in Cleveland, O., when a demonstration of the efficiency of the system was being made.

The cleaner itself consists of a nozzle supported on runners which discharges through a small turbine water motor, causing one or two sets of hook-shaped blades to revolve rapidly. The waste water carries away the dirt thus stirred up.

TREE ROOT REMOVED FROM SEWER BY SIEBEN MACHINE

Valve for Controlling Water Level

The Cleveland Steel Tool Company, Cleveland, O., has placed on the market a new valve, called the Hydromatic, for controlling the water level in stand-pipes, tanks, and the like. The special advantages claimed for this valve, which is made in ten sizes, ranging from one to eight inches in diameter, are the maintaining of the water level constant at all times within one inch; the elimination of leaky balance valves and the regrinding of balance valve seats; tanks are prevented from overflowing, and a saving in water is effected. The capacity is claimed to be greater than that of other valves of a similar rating, which is due to the form of its construction and the manner of its operation. The only part of the valve subjected to wear is the ring, which can be replaced without disturbing the piping in about ten minutes at a trifling cost. The illustration shows an interior view of the valve; A is the inlet and B the outlet; C is a 1/4-inch pipe through which water passes from the head chamber above the plunger to the tank when water has been drawn from the latter. Vent holes in the plunger top are located at D, and a lead or rubber gasket at E makes a tight joint between the plunger and its seat. As the copper float is lowered by the withdrawal of water from the tank, the pilot valve D is opened. This causes water to flow from the head chamber above the valve plunger through the 1/4-inch pipe C, and relieves the pressure on the upper part of the plunger enough to enable the pressure of the water entering the inlet A to force the plunger up. The flow of water through the valve into the tank then starts, and when the water level is re-established the pilot valve D closes. The pressure above the plunger is then built up through the vent holes D in the plunger top and the plunger is forced down against the gasket E and the flow of water through the valve shut off.

The valve body is of cast iron and has a removable cover plate of the same material. The brass plunger is made in two parts and the lower portion is threaded to screw into the upper one at E. The top of the plunger is piston-fitted into a brass bushing. A 5-inch seamless Hercules copper float is used in all sizes of valves, and is set at the height of the required water level inside the tank or in a casing on the outside. When mounted in this way the float casing is connected by a 1 1/2-inch pipe below and a 1/2-inch pipe above. The valve is connected in the supply pipe at any distance either above or below the float.

Grapple for Handling Garbage

The Browning Engineering Company, Cleveland, O., manufacture an automatic grapple or fork which successfully handles a class of materials which have hitherto proved difficult to handle by mechanical means. Garbage, for example, has been handled by hand at many of the reduction plants in the country. Recently the Chicago Reduction Company, Chicago, Ill., has installed a Browning automatic grapple in connection with a stiff-leg derrick and hoisting engine for handling their garbage, and have, it is said, saved \$20 a day in labor thereby. One of the accompanying illustrations shows this grapple just after it has taken its load

BROWNING AUTOMATIC GRAPPLE

from the pile below. The other illustration shows the construction of the device. The Browning automatic grapple is of the two-rope type, for use in connection with locomotive cranes, derricks, overhead trolleys, etc., for the rapid and economical handling of pulp or cordwood, manure, garbage and like materials. The yoke from which the tines of the fork are suspended is a solid casting, so constructed as to allow the grapple to hang vertically under all conditions. To it is attached the opening or lowering line and a guide sheave for the closing and hoisting line. The side arms are of forged steel, with removable bushings of either tool steel or phosphor bronze at each end. The forks or tines are of cast steel, rigidly braced together at the corners by angles strongly riveted to them. The opening of the grapple is governed by a chain which is fastened to the yoke casting and is wound or unwound on the extended hubs of the drum as the closing line is drawn in or let out, thus closing or opening the device.

Indirectly the use of this grapple diminishes the nuisance of odors from garbage, by providing a means for quickly handling it. The principal cause of objectionable odors about reduction plants is said to arise from standing garbage.

BROWNING AUTOMATIC GRAPPLE LIFTING LOAD OF GARBAGE

NEWS OF THE SOCIETIES

New York State Conference of Mayors.—The second annual convention opened at Columbus Institute, Poughkeepsie, N. Y., May 25. Mayor Charles Duryee, Schenectady, opened the meeting and presented Mayor John K. Sague, Poughkeepsie, as the chairman. In his address of welcome Mayor Sague spoke of the inclination of the citizens to celebrate because of the completion of the \$50,000 guarantee fund raised for the purpose of securing industries for Poughkeepsie. The first address was by City Engineer E. A. Fisher, Rochester, who spoke on paving and care of streets. The speaker suggested as essential to proper work in paving the establishment of municipal testing laboratories. He believed that property owners should select the kind of paving and that the city at large should pay for at least 25 per cent. In repaving the city should pay a larger per cent. Regarding widths of residence streets he favored 26 feet, or if they had car tracks 38 feet. A. Prescott Folwell, editor of the Municipal Journal, in a paper on "Paving Policies and Modern Streets," made the suggestion that where streets are cleaned regularly municipalities should also clean the sidewalks. He contended that the sources and nature of dust are the same and equally objectionable. He further argued that the modern standards of health and comfort demand the removal of filth and slime as well as dirt and mud. In regard to the cost of paving Mr. Folwell suggested that a municipality assess on property the cost to such roadway and sidewalk paving as will be suitable for side residence streets; if more expensive paving is required because of traffic the municipality should pay the balance from its treasury.

Following Mr. Folwell's paper, Mr. W. D. A. Ryan, head of the illuminating department of the General Electric Company, discussed "Street Lighting, Artistic Modern Methods Adapted to Cities." Mr. Ryan's address was illustrated with stereopticon slides. He said that one great difficulty is to get cities to realize that there is a proper height for hanging each particular kind of lamp and that the best results cannot be obtained unless the lamps are hung at that height. "Most lamps," he said, "are hung too low. To hang a powerful light too low is positively criminal." He urged cities not to place large lights where there are no large buildings to help in reflecting the light and contended that the reverse of the proposition is equally true. Mr. Ryan emphasized very strongly the difference between the American and European light and showed that we are not one-half lighted on this side of the water. He said that the best lighting in this country is done in Minneapolis. Not that more light is used there, but because what they use is used judiciously. Conditions were studied and the lamps so selected and placed as to get the greatest amount of good.

Governor John M. Dix delivered an address on "The Attitude of the State Toward the Municipality." He spoke for municipal home rule, declaring that the theory that legislators from widely diverse sections of the State could make provisions for the control of cities in every other section was false logic. Homer Folks, secretary of State Charities Aid Association, spoke on "Budgetary Provisions for Social Work in Mu-

nicipal Life." In the evening the delegates, including the Governor and his suite, were given a sail down the river to West Point, where the Governor's salute was fired and a parade and artillery drill was witnessed.

The first paper presented at the second day's session was by Edward L. Heydecker, assistant tax commissioner, New York City, on "Municipal Taxation and Assessment." He dwelt on the deficiencies of the law, which permit municipal funds to be spent without any report being made of them. Neither the State Board of Taxation nor the Comptroller are able to get full returns. "The Social Usefulness of the Police Force" was the subject of an address by John A. Kingsbury, general agent New York Association for Improving the Condition of the Poor. He made a plea for a broader view of the duties of the policeman and said if he must carry a billy he should also wear a red cross on his sleeve. Robert L. Owen, United States Senator from Oklahoma, made an address on "Commission Government." He reviewed the history of commission government and described the reforms that had been accomplished through its agency in a number of cities.

On account of the length of the program it was found necessary to omit most of the discussions of papers which had been announced. These, however, will be printed in the proceedings of the meeting. The events of the last two days of the convention will be given in these columns next week.

New England Conference on Street Cleaning.—The second annual conference was held at the Board of Trade, Springfield, Mass., May 17. The meeting was held under the auspices of the Bureau of Social Research of Rhode Island and the Springfield Board of Trade. One of the scheduled speakers, Dr. George A. Soper, president of the Metropolitan Sewage Commission of New York, was unable to attend, but sent a telegram, which was a brief but instructive document. It was an address in 16 words covering the subject, "Some Lessons to be Learned From European Street Cleaning Methods," and read as follows: "My entire paper here follows. Experience teaches that for clean streets we must organize, systematize, deputize, energize, supervise, economize, and philosophize. With hearty wishes for a successful conference, George A. Soper." This message was read by Carol Aronovici, director of the Social Research Bureau, and was heartily applauded. Dr. Ernest Meyer, United States Census Bureau, Washington, D. C., spoke on "Uniform Methods of Accounting in Street Cleaning Work." He said that many different equations in the matter of paving, litter, amount of travel, etc., enter largely into street cleaning cost and that they should be systematized for the best results to the city. Wallace Hatch, secretary of the Rhode Island Anti-Tuberculosis Association, spoke on the "Relation Between Tuberculosis and Dust." He said that according to different authorities the relation of dust to tuberculosis was near or remote, but all agreed that it was one of the predisposing causes. Carol Aronovici spoke on "Street Cleaning in City Slums." He said that a street should be considered as more than a connecting link from one portion of the city to another, but should be looked on as an approach to a home from school, factory and workshop. Considering the

street as a part of a home, it was a gathering place, especially in the slum districts, where the street is used as a nursery, meeting place, ventilating spot and common bedroom of a district. If it is accepted that the street is the main factor in the social intercourse of the poor, the construction and care of streets implies more than the requirements of accessibility, easy grade and safety. The streets should be constructed of smooth, washable and sweepable material. He favored the system of washing streets in preference to oiling, where, he said, greasy and contaminating dust results. Speaking of refuse removal, he favored the intelligent supervision and co-operation of the police. S. H. Stone of the Boston Anti-Tuberculosis Association made an address on the relation of street dust to tuberculosis. He argued that the dust itself, even though sterile, is a dangerous irritant, lacerating the air passages and thus making them less able to resist the planting and growth of the germs when they arrive. To avoid this danger three conditions of street management were necessary. Smooth paving cleaned by flushing, a minimum height of buildings, so as not to shut out sunlight, and the immediate removal of garbage so as to minimize the danger from flies. Prof. H. A. Blanchard, Providence, R. I., gave a very practical address on "Dust and Its Prevention," in which he advocated combined sweeping and flushing.

City Marshals' and Police Chiefs' Union of Texas.—The seventeenth annual convention was held in the main auditorium of the City Hall, Fort Worth, May 17-19. President John M. Brown, Weatherford, opened the convention. He made a sensation by saying that the unwritten law and habeas corpus proceedings in criminal trials were the two great loopholes of escape for criminals. Mayor W. D. Davis made the welcoming address in behalf of the city and Walter B. Scott in behalf of the people. Former City Marshal Fred Long, Itaska, responded. Dr. Samuel P. Benbrook, Dallas, made an address on the "Positive School of Criminology," the followers of which believe that the environment of the individual has much to do with determining the matter of crime. The speaker ascribed most of the anti-social acts of the criminal to failures in their full duties of the home, church and schools.

The recent ruling of the Supreme Court in regard to the right of a Texas city to set aside a reservation was made the basis for assault by speakers before the assembly. This ruling says that it is unlawful for a city to maintain a reservation, and was the result of an appeal from the city of Dallas. The decision was severely criticised, and chiefs of police and city marshals from all the larger cities in the State made known their intention of openly defying the order.

The association decided to use its influence to bring about a reform in the manner of handling the juvenile offenders against law or those juveniles who are waifs.

Henry De Spain, Sherman, was elected president; vice-presidents, Police Chief Hollis Barron, Waco; John R. Snyder, Amarillo, and W. L. Sallis, Brenham; M. T. Forrest, Houston, continues as secretary and treasurer; Charles W. Newby, Fort Worth, was elected assistant secretary. San Angelo was selected as the next meeting place.

International Association of Chiefs of Police.—Major Richard Sylvester, as president of the association, has called a meeting of the board of governors of the National Bureau of Identification to be held in Washington, D. C., June 10. The members of the committee are Frank J. Cassada, Elmira, N. Y.; John T. Janssen, Milwaukee, Wis.; Col. William Young, St. Louis, Mo.; William A. Pinkerton, Chicago; John B. Taylor, Philadelphia, Pa.; J. J. Donahue, Omaha, Neb.; T. A. McQuaide, Pittsburg, Pa.; T. F. Farnan, Baltimore, Md.; J. J. Downey, Detroit, Mich.; J. W. Reynolds, New Orleans, La., and Major Sylvester.

The meeting of the board will be held in the office of Major Sylvester at police headquarters, and a social session will follow the meeting. Members of the board will go from here to Rochester, N. Y., where they will attend the annual meeting of the International Police Association, June 13.

It is expected that there will be a large attendance at the convention in Rochester. Major Sylvester, as president, having already been assured by many members of the association that they will be in attendance.

Washington Society of Engineers—Members of the society made a trip of inspection to the concrete dam and generating station at McCalls Ferry, Pa., May 21. The party went by special train to Baltimore, where they were joined by a delegation of the Engineers' Club of that city. Local members from both cities of the American Institute of Electrical Engineers also took part in the excursion.

National Fire Protection Association—The fifteenth annual meeting was held at the Waldorf-Astoria, New York City, May 23. According to reports presented, the fire waste of this country so far this year is \$16,000,000 more than the average, and 1911 is the most disastrous year since that of the San Francisco catastrophe. The average yearly fire waste has jumped to \$250,000,000.

H. L. Phillips, chairman of the Committee on Resolutions, presented the appeal to the public in the form of resolutions which were adopted promptly as well as unanimously. The appeal is:

"The National Fire Protection Association, with all the force at its command, wishes to place before the public in the strongest possible terms that the situation in connection with the fire waste is becoming so acute that there is necessity for action.

"Action by all cities and towns in adopting proper building codes, which will call for improved conditions and the use of fire resisting construction in congested districts.

"Action by the State and municipal authorities covering the regulation of the transportation and storage of inflammable oils and explosives.

"Action by those in authority to the end that all buildings where people congregate, such as schools, theatres, factories and hotels, shall be so constructed and equipped that the lives of persons within them will be safeguarded.

"Action by the proper authorities requiring the introduction of automatic fire extinguishing apparatus in all commercial establishments and city blocks.

"Action by the proper authorities prohibiting the manufacture and sale and use of the snap match, and requiring the universal adoption and use of the safety match.

"Action by the public in bringing about a safe and intelligent celebration of Independence Day; and, above all

"Action by every citizen of the land in using his individual effort in the cause of educating the public in regard to the dangers from fire, not only in so far as it applies to the personal and immediate consideration, but also from the broader standpoint, namely, that of the welfare of our land.

"For the adoption of these principles for which it stands the National Fire Protection Association asks immediate action."

Calendar of Meetings

- May 29-June 2.**
National Electric Light Association.—New York City.—T. C. Martin, Secretary. 31 West 39th St.
- June 5-14.**
National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-8.**
Engineers' Society of Pennsylvania.—Annual Meeting at State College, Pa.—E. R. Dasher, Secy., P. O. Box 704, Harrisburg, Pa.
- June 6-10.**
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.**
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.**
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 8-10.**
National Association of Comptrollers and Accounting Officers.—Annual Convention, Arlington Hotel, Washington, D. C.—George M. Rex, Secretary, 525 Industrial Trust Building, Providence, R. I.
- June 11-16.**
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.**
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.**
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.**
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- June 22-24.**
Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.
- June 28-29.**
South Carolina Water Works Association.—Meeting for Organization, Columbia, S. C.—W. F. Steiglitz, Temporary Secretary, Columbia, S. C.
- June 28-30.**
International Association for the Prevention of Smoke.—Annual Convention, Newark, N. J.—R. C. Harris, Secretary, City Hall, Toronto, Ont.
- August 15-18.**
Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 12-15.**
International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 18-30.**
International Municipal Congress and Exposition.—Chicago, Ill.—Curb M. Treab, Secretary, Great Northern Building, Chicago, Ill.
- September 19-22.**
International Association of Fire Engineers.—Annual Convention, The Auditorium, Milwaukee, Wis.—James McFall, Secretary, Roanoke, Va.
- September 19-22.**
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.**
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.**
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6.**
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.
- November 13-17.**
National Municipal League.—Annual Meeting, Richmond, Va.—Clinton Rogers Woodruff, Secretary, North American Building, Philadelphia, Pa.

PERSONALS

ALVORD, E. B., was elected Mayor of Henderson, Tex.

BECK, HARRY N., has been appointed City Engineer of Muskegon, Mich.

BELLIS, ROGER, has been elected Mayor of Hyattsville, Md.

BEMIS, EDWARD W., of New York, has been appointed appraiser to make the valuation of Toledo Rail-Light property in connection with its being taken over by the city.

BETZ, CHARLES, has been appointed Superintendent of Streets of Belleville, Ill. BLISS, GEO. N., is the new Mayor of Port Arthur, Tex.

BROWN, T. C., has been elected Mayor of Tazewell, Va.

BUCK, H. M., of Waukeshas, has been elected president of the Wisconsin Gas Association for the ensuing year.

CAREY, FRANCIS K., has resigned as head of the City Plan Commission of Baltimore.

CONAWAY, JAMES C., is the new Mayor of Grass Valley, Cal.

CURTIS, DR. HENRY S., has recently visited Dallas, Tex., in the interest of the playground movement.

FOOTE, JOHN, has been appointed assistant city engineer of Little Falls, N. Y.

GRANT, WHIT M., is the new Mayor of Oklahoma City, Okla.

HAYNES, ROWLAND, field secretary of the Playground Association of America, has just paid a visit to Erie, Pa., where he gave illustrated talks in the interest of playgrounds.

KIRBY, E. N., is the new Mayor of Abilene, Tex.

MANDELL, T. H., has been re-appointed City Engineer of Lake Charles, La.

MCKENZIE, RODERICK, has been appointed by the Mayor as a member of the Board of Public Works of Salt Lake, Utah.

NIEDHAM, MRS. MABEL R., has been appointed secretary of the Board of Park Commissioners of Indianapolis, at a salary of \$1,200 a year, succeeding Leroy E. Snyder, who resigned to become secretary of the Indianapolis Trade Association.

O'CONNOR, THOMAS, the oldest fire chief in the United States, both in point of service and age, committed suicide recently following an illness which seized him several months ago. He became head of the New Orleans Fire Department in the spring of 1869, and has served in that capacity ever since. He was 72 years of age.

RANKIN, J. E., is the new Mayor of Knoxville, Tenn.

ROBINSON, CHARLES M., will shortly visit Binghamton, N. Y., to work on the new city plan system fathered by the Mercantile Press Club that is to be inaugurated.

SMITH, FRANCIS V., chemical engineer of New York City, has just completed an investigation of the asphalt pavements of Syracuse, N. Y.

STOWASSER, W. H., has resigned as Mayor of Barboursville, W. Va.

VELLA, T. C., who was recently appointed Chief of Police of San Bernardino, Cal., has been obliged to resign, as he is not a citizen of the United States.

WHIPPLE, GEORGE C., New York, N. Y., Consulting Engineer, who has been appointed Professor in the sanitary engineering department, Harvard University, will retain his present office, 103 Park avenue, New York City, and continue to carry on his work as Consulting Engineer.

WILSON, DR. C. S., has been appointed City Bacteriologist of Tacoma, Wash.

INDUSTRIAL NEWS

Cast Iron Pipe.—Chicago: Inquiries are good and a number of municipal contracts are pending. Prices are firm. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: The demand and general inquiry are reported good. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, average, \$21. New York: Inquiries are good and large municipal contracts are pending. Quotations: 6-inch, car loads, \$21 to \$22.

Lead.—Lead is weaker and demand is light. Quotations: St. Louis, 4.225c.; New York, 4.375c.

Valves.—The Chapman Valve Manufacturing Company, Springfield, Mass., has carried through its plan of financial reorganization. A new corporation has been organized under the same name, with the exception that a "the" has been introduced before the corporation title. The nominal capital stock is reduced from \$1,300,000 to \$1,000,000, but the actual cash capital is \$200,000 greater. Of the shares \$500,000 are 7 per cent cumulative preferred and an equal amount common stock. The incorporators are members of the old board, namely, Adolph W. Gilbert, Edwin A. Carter, George B. Holbrook, Dwight O. Gilmore and William C. Godfrey.

Auto Combination Wagon.—One of the American Fire Apparatus Company's auto chemical and hose wagons was exhibited at Westfield, N. J. Frederick Bryant, 1 Madison Avenue, New York City, accompanied the car and gave Fire Commissioner Hohenstein, Chief Dicher, Assessor Appley and representatives of the press a good demonstration of the machine.

Rapid Pipe Laying.—Forty-three miles of pipe, ranging from 2 to 12 inches in diameter, have been installed in San Leandro and the district recently annexed to Oakland, Cal., within the last six months by the Bay Cities Water Company, a subsidiary corporation of the United Properties Company. This achievement, involving an expenditure of almost \$500,000, has never, according to Manager Charles E. Gilman, been duplicated in any city in the United States of a similar size and in the same given time. So quietly has the company worked that it is not generally known that such progress has been made. Two hundred and fifty carloads of pipe will arrive in Oakland from the East within the next three months, and is to be installed from Seventy-sixth avenue, the street to which the system is now built, to Lake Merritt, completing the entire annexed district and East Oakland. This work will also cost close to half a million dollars. Sufficient revenue is now being taken in by the new company to pay the expenses of the office force in the First National Bank Building. This money is being taken in through the service to 1,250 residences in which the Bay Cities Company has installed pipe and meters. Although the new company invaded the local field less than a year ago, it is delivering on an average 750,000 gallons of water daily, secured from artesian wells at Roberts' Landing, near San Lorenzo, where the auxiliary plant is located. It is claimed that new customers are being secured at the rate of 25 a day.

Large Order of Motor Engines.—The Seagrave Company, Columbus, O., has received, through President Culpepper Exum, of the Board of Commissioners, Birmingham, Ala., an order for nine motor-propelled combination chemical and hose fire wagons. In addition to the nine wagons ordered, it is the ultimate intention of President Exum and Fire Chief Bennett to order nine additional wagons of the same type. The city will have, when the nine arrive, 12 Seagrave wagons, two Webb wagons and one fire engine, auto-propelled.

New York Fire Alarm Boxes.—The New York Fire Department recently awarded a contract for 150 fire alarm boxes to the Star Electric Company. The contract was awarded after a careful investigation, from which the following is quoted. As the competition was principally between the Star and Gamewell boxes, the report regarding the other boxes on which bids were made is omitted. J. C. Rennard, electrical engineer of the Fire Department, says:

"In accordance with the conditions of the specification and the resolution of the Board of Estimate and Apportionment, a test of the boxes submitted by the companies bidding was conducted at Fire Department Headquarters by the Chief Engineer of the Board of Estimate and Apportionment and the Fire Commissioner on March 20, 1911. At this test were present: Nelson P. Lewis, Chief Engineer, Board of Estimate and Apportionment; John C. Rennard, Electrical Engineer, Fire Department; George F. Sever, Consulting Electrical Engineer, Department of Water Supply, Gas and Electricity; Otto Klein, Chief Engineer of the Commissioner of Accounts; George L. Foote, Henry G. Pierson, representing Foote, Pierson & Company; C. E. Beach, G. E. Morley, representing Star Electric Company; A. H. Cross, F. W. Cole, representing Gamewell Fire Alarm Telegraph Co.

"The test consisted in a practical demonstration of the operation of the various boxes under conditions simulating actual service, and in a detailed examination of the mechanism of each box by the Committee with the assistance of the experts of the manufacturers.

"A further examination and test was made on March 27 at Fire Department Headquarters by Messrs. Lewis, Rennard and Sever. As a result of these tests the following conclusions are drawn:

"1. That the boxes submitted by the Gamewell Fire Alarm Telegraph Company and the Star Electric Company are non-interfering and successive and fulfil the conditions of the specification.

"2. That the successive feature of the Gamewell box is limited in that if more than four boxes on the same circuit are pulled at the same time not more than three or four boxes will transmit their signals. The Star Electric Company box will transmit its signals in succession up to the limit of the spring power, which in the box under test was thirty-six rounds of the circuit wheel, thus permitting nine boxes to be pulled together on the same circuit when each box in succession would send in a complete signal.

"3. That the Star Electric Company

box sends in signals with less loss of time than the Gamewell box in that it tests the circuit after every round of the circuit breaking wheel, whereas the Gamewell box tests the circuit only after every fourth round of the circuit breaking wheel, thereby causing a possible delay of the time required for three complete revolutions of the circuit wheel.

"4. The circuit breaker contacts in the Star box are mechanically snapped open and closed, giving an efficient sliding contact. On the Gamewell box the circuit breaker contacts are opened by the straightening of a flat spring which is bent by a tooth of the circuit wheel to make contact with another flat spring for closing the circuit. Practically no sliding movement is caused in this contact.

"5. The circuit breaker contacts of the Star boxes are normally open when the box is shunted out and are not liable to weld together by the passage of an abnormal current. On the Gamewell box this circuit-breaking contact is closed when the box is shunted out and the passage of a current may weld them together and thus prevent the further operation of the box.

"6. The Star box will properly operate on an increase of current that will make the Gamewell box interfering.

"7. If the Gamewell box is pulled on an open circuit it will run for about two minutes and stop, having, of course, not transmitted its signal. If the circuit should be closed immediately after the two-minute period still no signal would be received from this box. The Star box if pulled on an open circuit will not run at all until the circuit is closed, and will then send in its signal. This is considered an important advantage in that the circuit might easily be opened for a period of two minutes, due to a change being made in a cable or the replacing of a blown fuse, and while the length of time the circuit is open would be known there would be no indication of a Gamewell box having been pulled during this time. If the Gamewell box is allowed to run down from lack of winding, it may leave the circuit open, and, therefore, inoperative, until the box is rewound. If the Star box is allowed to run down it will mechanically close the circuit before stopping.

"8. The mechanism of the Star box is more complicated than the Gamewell box, and is so of necessity, because it accomplishes more. It is not believed, however, that the Star box is more difficult to maintain than the Gamewell box in actual practice. Each box is sufficiently complicated to practically require removal to a shop for any material repairs.

"9. The component parts of the mechanism of each box are well and substantially made and the adjustments are all practical.

"10. Both of these boxes have been tried in actual service a sufficient length of time to demonstrate practicability for operation under the conditions named.

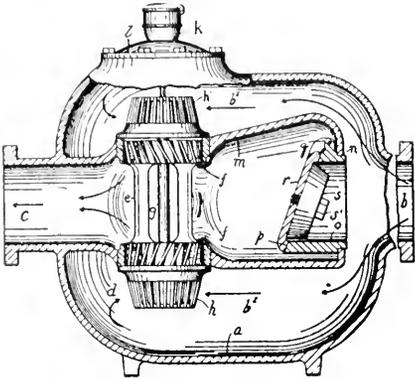

"11. Both boxes will operate in connection with the apparatus now installed in the Fire Alarm Telegraph central offices of the city of New York.

"For the above conclusions the Committee unanimously recommend the acceptance of the bid of the Star Electric Company, who are also the lowest bidders for the fire alarm boxes complying with the specification requirements."

PATENT CLAIMS

992,951. **WATER METER.** Ernest E. Gamon, Newark, N. J. Serial No. 496,851.

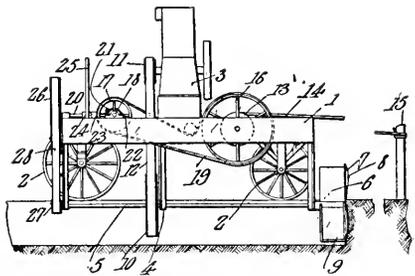

In a water meter, the combination with a main casing having inlet and outlet spuds, upper and lower receiving chambers and an intermediate supplemental chamber, propeller wheels mounted in said supplemental chamber for measuring the

flow of water therethrough under normal conditions and automatic means inserted in said supplemental chamber for permitting direct communication between said spuds and supplemental chamber under abnormal conditions when the difference in pressure between said spuds reaches a certain predetermined point.

992,866. **DITCHING MACHINE.** Horace G. Francis, Dexter, Mo., assignor, by direct and mesne assignments, of one-half to Emmett S. Willis and one-fourth to James K. Robinson, Dexter, Mo. Serial No. 561,632.

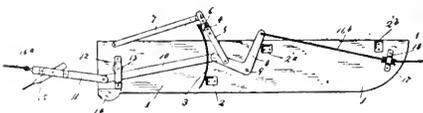

A ditching machine comprising a frame mounted at its end portion upon supporting wheels, an engine mounted upon the frame at a point approximately midway between the ends thereof, hangers depending from said frame, a shaft journaled in said hangers and at its end portions pro-

jecting beyond the ends of the frame, a cutter mounted upon the forward projecting end of the shaft, means operatively connecting the engine with the shaft at an intermediate point thereof, a winding mechanism mounted upon the forward portion of the frame, and a reducing gear operatively connecting the winding mechanism with the rear projecting end portion of said shaft.

991,665. **SCRAPER FOR CLEANING LAKE AND RIVER SHORES.** Charles W. Stubbs, Maple Plain, Minn. Serial No. 589,718.

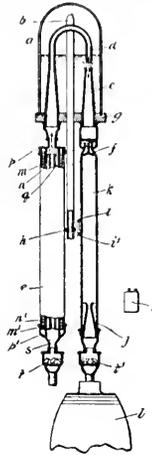

In a device of the kind described, the combination with a carriage and a scraper mounted for movements thereon to and from operative position, of connections for moving said carriage to and fro on a dis-

tant point including means for automatically throwing said scraper into operative position when said carriage is drawn in one direction and for throwing said scraper into inoperative position when said carriage is drawn in the other direction.

992,980. **OZONE-PRODUCING APPARATUS.** Octave Patin, Paris, France. Serial No. 454,260. Divided. Serial No. 584,434.

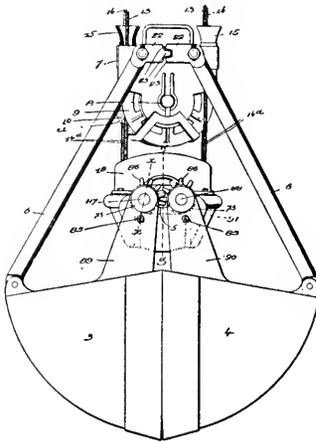

An ozone apparatus comprising two con-

centrically positioned tubes having an annular space therebetween, an electrode positioned within the inner tube, and a second electrode formed of a coil of wire, said coil being wound spirally upon the outer tube.

992,799. **HOISTING BUCKET.** Almon E. Norris, Cambridge, Mass. Serial No. 346,380. Renewed Sept. 29, 1910. Serial No. 581,575.

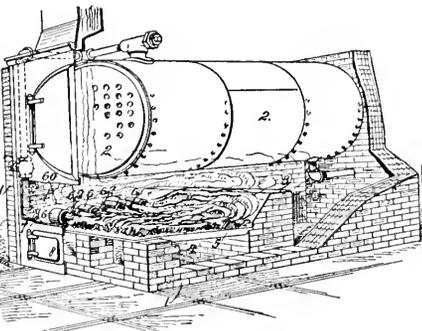

In a bucket, the combination with two bucket segments, of a head to which said

bucket segments are secured, three axially aligned sheaves carried by the head, a holding rope passing around one sheave, and an opening-and-closing rope passing around the other sheaves.

993,148. **SMOKE CONSUMER.** George Bromm, Saginaw, Mich., assignor of one-third to John Dengler and one-third to John L. Schwab, Saginaw, Mich. Serial No. 598,893.

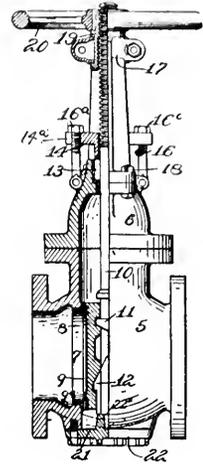

The combination with the furnace, of a smoke consuming attachment comprising a main flue having a series of smoke flues projecting through the side wall of the fur-

nace, said flues being projected at right angles from the main flue, a series of supplemental nozzles that project from the upper edge of the flue and incline downwardly with respect to the smoke flues and blower devices that enter the main flue and eject into the supplemental nozzles thereof.

992,933. **GATE VALVE.** Frederick R. Banks, Paterson, N. J. Serial No. 576,589.

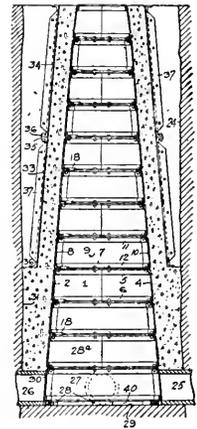

In a gate valve, a casing having valve seats therein, disk valves co-operating with said seats, a rod independent of the valves and having projections thereon engaging with the valves to open and close

them, detachable means for moving the rod, said casing having an opening in its bottom in line with said valves and rod and through which the same may pass, and a removable cover for closing said opening to the casing.

992,782. **FORMING CONCRETE MANHOLES.** Charles S. Lambie, Wilkensburg, Pa. Serial No. 572,026.

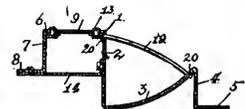

The herein described method of forming concrete manholes, consisting in supporting within the excavation a form composed of downwardly flaring sectional annular shells

by means of a removable support, molding the concrete around the form, removing the support and dropping the lowest sectional annular form into the space so provided, separating it into sections and removing the sections upwardly from the manhole and dropping and removing the other annular shells in the same way.

993,244. **METALLIC CURB AND GUTTER.** George W. Hanbrough, San Francisco, Cal. Serial No. 549,669.

In curb and gutter structures, a metallic plate fashioned to present in cross section a vertical inner wall having an offset top flange, a gutter floor, an outer abutment wall and an outer retaining flange for the adjacent edge of the pavement to rest upon; in combination with a second plate

fashioned to present in cross section a laterally extending base-retaining part, a vertical wall and a top flange; and a top resting upon and removably secured to said top flanges of the vertical walls of the respective plates, and constituting with the first and second mentioned plates a curb.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

Table with columns: STATE, CITY, RECEIVED UNTIL, NATURE OF WORK, ADDRESS INQUIRIES TO. Includes sub-section 'STREET IMPROVEMENTS' and lists various projects across different states like Ohio, New York, Pennsylvania, etc.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS (Continued)				
New Jersey	Camden	June 14, 11 a.m.	Resurfacing the Camden and Westfield Turnpike, material to be applied by the ton, consisting of about 4,065 tons asphalt concrete, 3,677 tons 1½-in. stone, 3,465 cu. yds. gravel	J. J. Albertson, County Auditor. Win. E. Munchenburg, County Aud.
Indiana	Winamac	June 15, noon	Constructing a highway on line bet. Paluski & Starke Counties.	
Tennessee	Chattanooga	June 15, 1 p.m.	Improving various streets, consisting of about 32,000 sq. yds. paving; 19,000 lin. ft. concrete curb and gutter.	E. D. Bass, Chm. Road Com.
New Jersey	Elizabeth	June 15, 8:30 p.m.	Paving various streets with brick, asphalt and trap rock, setting curbs and gutters.	N. K. Thompson, Street Comr.
Ohio	Cincinnati	June 16, noon	Improving the Loveland and Madeira road; constructing culvert and approaches on Betts ave. in Springfield township.	Stanley Stubie, Pres. Bd. Co. Comrs
New York	White Plains	June 19	Constr. a ten foot center strip of macadam asphalt in portion of Church street.	John J. Brown, Pres. Bd. Trustees.
Tennessee	Springfield	June 20, noon	Grading, ditching and macadamizing about 50 miles of public roads in Robertson County.	Jos. E. Washington, Chm. Bd. Co. C.
SEWERAGE				
New York	Fort Hamilton	June 2, 11 a.m.	Constructing a sanitary sewer.	Constructing Quartermaster.
Ohio	Bellefontaine	June 2	Constr. reduction tank, primary contact beds, outlet drains, etc	Dir. Public Service.
Wisconsin	Richland Center	June 2	Constructing sanitary sewers and appurtenance	W. F. J. Fogo, Chm. Com. Pub. Wks.
New Jersey	Englewood	June 3, 3 p.m.	Constructing a sewage disposal plant complete	Oliver Drake Smith, Secy. Sew. Com.
Illinois	Ft. Sheridan	June 5, noon	Constr. sewage dis. plant complete, at Fort Sheridan.	Capt. M. E. Saville, Constr. Q.M.
Ohio	Willoughby	June 5	Install a san. sewer with manh., house and lot con. in Euclid st.	C. C. Jenkins, Village Clerk.
South Dakota	Plankington	June 5	Disposing of sewage now emptied into small nearby dry creek.	C. E. Goodlad, City Auditor.
Dist. of Col.	Washington	June 5	Constructing sanitary sewers in various streets.	Cuno H. Randolph, Comr.
Pennsylvania	Chester	June 5, 8 p.m.	Constructing pipe sewers.	Jos. H. Griffith, Boro. Clerk.
New Jersey	Perth Amboy	June 5, 8:30 p.m.	Constr. sewers in Johnstone and Jeffreys sts.	Geo. M. Adair, Street Comr.
Nebraska	Omaha	June 5	Constr. 400 lin. ft. 6-in., 2½ ring brick circular sewer; 1,342 lin. ft. 6-in. reinforced concrete sewer; 16 lin. ft. funnel section; 1,392 lin. ft. 5-ft. 2-in., 2 ring brick circular sewer; 1,227 lin. ft. 3-ft. 4-in., 2 ring brick circular sewer; 556 lin. ft. 3-ft., 2 ring brick circular sewer; 420 lin. ft. 4-ft. 6-in. brick circular sewer; 1,710 lin. ft. 3-ft., 6-in. brick and plain concrete sewer; 510 lin. ft. 5-ft. reinforced concrete sewer; 510 lin. ft. 7-ft. 2½ ring brick circular sewer; 1,220 lin. ft. 5-ft., 2-in., 2-ring brick circular sewer.	Geo. W. Craig, City Engr. Harry B. Salter, City Clerk.
New Jersey	Trenton	June 6, 8 p.m.	Constr. sanitary and storm water sewers in various streets.	
New York	Ossining	June 6, 8 p.m.	Constr. the Kill Brook Trunk Sewer; bulkhead dock and screening chamber at outfall end; also other sewers.	J. M. Terwillinger, Village Clerk. Boro. Council.
Pennsylvania	Bristol	June 7, noon	Constr. complete system of sewerage and disposal plant.	E. H. Christ, Pres. Bd. Pub Wks.
Michigan	Grand Rapids	June 8	Constr. a public sewer to be known as the East Side Trunk Sewer	A. B. Maupin, City Engr.
West Virginia	Huntington	June 10, 1 p.m.	Constructing sewers in various streets, size 12 to 18-in.	Grover E. Yerdon, City Clerk.
New York	Jamestown	June 12, 7:30 p.m.	Constr. about 30,000 lin. ft. vitrified tile sewer 30 and 24-in.	Robert Tait, Treasurer.
Alabama	Montgomery	June 13, noon	Constr. sanitary sewer on Sayre St. and necessary inters. sewer	Boro. Clerk.
Pennsylvania	West Chester	June 14	Constr. of outfall sewers and disposal plants.	Chas. A. Trimmer, City Engr.
South Dakota	Madison	June 20	Installing a sewer. Estimated cost \$65,000	A. B. Pearsall, Chm. Bd. Pub. Wks.
North Carolina	Red Springs	June 27, 3 p.m.	Constr. a sewer system including 4½ miles of 8 to 15-inch pipe.	City Clerk.
California	San Jose	July 3	Construct septic tank for County hospital.	
WATER SUPPLY				
North Dakota	Mandan	June 2	Improving water works.	Lee Nichols, City Auditor.
Alabama	Ft. Morgan	June 2	Furn. a motor driven deep well pump, elec. trans. line, 4-in. cast iron water main, etc.	Lieut. E. F. Barlow, Con. Q. M.
Missouri	St. Louis	June 2, noon	Furn. detailed drawing, constructing and erecting at Low Service Pumping station two steam, turbine-driven centrifugal pumping units, complete with condensing apparatus.	Board Public Improvements. Henry S. Thompson, Comr. W. Sup.
New York	New York	June 5, 2 p.m.	Furn. pipes, valves and pipe fittings, boiler and pipe covering.	
New York	Yonkers	June 5	Furn. 513 lengths of 30-in. water pipe, 4,700 lbs. to the length, total of 1,205 tons. 32 tons of special castings; 5 24-in. geared gate valves.	James V. Mahoney, Secy. B.C. & S. J. W. Jacobs, City Recorder.
Oregon	Central Point	June 5, 5 p.m.	Extending water mains.	W. R. Salisbury, Village Clerk.
Minnesota	Eden Valley	June 5, 8 p.m.	Constr. about 2,200 ft. of 2-in. water pipe.	H. J. Leland, County Clerk.
California	Los Angeles	June 5	Constr. a one-story brick power house at County Farm.	City Clerk.
Iowa	Leon	June 5	Constructing water works system.	Village Clerk.
Minnesota	Slayton	June 5	Constr. water mains in var. sts., about 3,650 ft.	C. H. Rust, City Engr.
Ontario, Can.	Toronto	June 6	Furnishing vertically driven pumps.	
New York	Schenectady	June 6, 1 p.m.	Installing pneumatic water system complete consisting of one direct electric driven pump, capacity 200 gals, per hour, one electric motor, automatic starting device and pressure regulator and two 1,500 gallon tanks.	John H. Peters, Clerk, Bd. Superv. F. L. Austin, Secy Water & Lt. Com.
Minnesota	Chisholm	June 6, noon	Furn. 57 tons of 4 and 6-in. c. i. water pipe.	
Ohio	Kenton	June 6, noon	Constr. a reinforced concrete reservoir, about 2,000,000 gals. capacity. Also building additions and making alterations to pumping station.	G. S. Binckley, Clk. Bd. Pub. Serv.
Texas	Winters	June 7, 6 p.m.	Furnishing material for construction water works system including engines, pumps, boilers, pipe, valves, hydrants, tank and tower.	Guy T. McDonald, City Secretary. A. H. Crowell, Superintendent.
New Jersey	Perth Amboy	June 7, 8:30 p.m.	Furnishing 4,000 ft. of 6-in. B. & S. water pipe and 6-in. specials	
Pennsylvania	Bristol	June 7	Constr. complete system of w. w. and filtr. plant of 2,000,000 gals. capacity.	Boro. Surveyor. James F. Ewers, Town Clerk. C. T. Church, Superintendent.
Wyoming	Basin	June 7	Constructing water works and electric light plant.	
New York	Geneva	June 8, 7:30 p.m.	Constr. concrete covered reservoir 2 million gallons capacity.	
Michigan	Marquette	June 9	Constr. an extension to the water works intake, consisting of about 2,230 ft. of 36-in. c. i. pipe with all appurtenances, riprap, dredging, etc.	J. P. Kern, Secy. Bd. Fire & W. C. Geo. H. Davis, Town Clerk.
Wyoming	Upton	June 9	Constructing system of water works.	J. D. Hunter, Mayor.
Louisiana	Rayne	June 10	Furnishing 4, 6 and 8-inch cast iron pipe, gate valves, hydrants, etc., 5,000 lbs. of pig lead, and 300 lbs. of tarred hemp.	H. M. Hammond, Chm. Bd. Pub. W.
Indiana	Richmond	June 12, 10 a.m.	Furnishing water to city for period of 25 years.	
North Carolina	Tarboro	June 15, 3 p.m.	Improving water works consisting of 500,000 gallon concrete filter plant 260,000 gallon concrete storage reservoir, auxiliary electric pumping station and 1 mile of 10 inch cast iron pipe.	W. O. Howard, Mayor. Henry L. Heilman, Secy. Bd. W. C.
Indiana	Evansville	June 17, 10 a.m.	Furnishing about 250 tons of c. i. pipe and spec. valves, meters.	
Quebec, Can.	Montreal	June 29, noon	Installing pumping machinery, blower and cranes at filtration plant.	L. N. Senecal, Secy. B.1. Comrs.
BRIDGES				
Kansas	Hutchinson	June 2	Constr. reinforced concrete slab and girder bridge 50 ft. long and 90 ft. wide.	Ed. Metz, City Clerk.
Ohio	Cleveland	June 3, 11 a.m.	Repairing and general bridge work.	John F. Goldenbogen, Clk. Co. Comrs
California	Richwood City	June 5, 10 a.m.	Constr. a concrete arch bridge over Woodruff Creek.	Jos. H. Nash, Clk. Bd. Supervisors.
Kansas	Leavenworth	June 5, noon	Repairing bridge No. 8 over Nine Mile Creek, Delaware twp.	J. A. Hall, County Clerk.
Indiana	Martinsville	June 5	Constr. a concrete bridge to cost \$38,000.	J. S. Whitaker, County Auditor.
Illinois	Pekin	June 5, 1:30 p.m.	Constr. 2 small reinforced concrete bridges in Tremont twp. and Tazewell County.	County Clerk.
Indiana	Greensburg	June 5	Repairing bridges.	Frank E. Ryan, County Auditor.
Indiana	Franklin	June 5, 1 p.m.	Constructing 7 small reinforced concrete bridges.	Wm. B. Jennings, County Auditor.

Armstrong, of the Department of Public Works, for improvement of South 18th st. and repaving and improving of a number of other streets; successful bidders were: South 18th st., M. O'Herron & Co., \$88,300; paving Coleman st., R. D. Thomas & Co., \$4,190.13; paving Industry st., Ott Bros., \$9,013.25; paving Ewer alley, J. B. Sheets Co., \$1,378.55; paving Meadow st., Barber Asphalt Paving Co., \$5,880.81; repaving with blockstone, 47th st., H. C. Howard, \$2,774.10; Davison st., H. C. Howard, \$3,344.65; Locust st., H. O'Herron & Co., \$2,355.55; South 19th st., Booth & Flinn, \$2,837.05; Mulberry alley, Evan Jones Co., \$1,069.65; Milbridge st., Ott Bros. Co., \$2,166.40; Penn ave., M. O'Herron & Co., \$12,911.96; Grandview ave., \$2,628.41; 20th st., Evan Jones Co., \$650.70; Gibbon st., M. O'Herron Co., \$1,487.30; repaving with brick, Pleasant Valley, H. C. Howard, \$1,239; Lotus alley, H. C. Howard, \$1,902.80; Tustin st., Tvan Jones Co., \$1,599.60; Fox alley, Thomas Cronin Co., \$3,129.60; repaving with asphalt, Holmes st., Barber Asphalt Paving Co., \$7,699.77; 42d st., Booth & Flinn, \$2,398.45; 5th ave., Booth & Flinn, \$8,437.90; repaving with blockstone and asphalt, Greenfield ave., Booth & Flinn, \$6,395.20; repaving with brick and asphalt, Adelaide st., Booth & Flinn, \$4,243.10; repaving with creosoted wood block, Ohio st., M. O'Herron & Co., \$8,346.25.

Milwaukee, Wis.—Street contracts, bituminous pavement, to Badger Construction Co., Greenfield ave., Clinton st. to 11th ave., \$1.40 sq. yd.; to R. F. Conway Co., North ave., 7th to 26th st., \$1.45, and Greenfield ave., 11th ave. to Layton Blvd., \$1.40 sq. yd.

BIDS RECEIVED

New Orleans, La.—Constructing Colfax-Rochelle rd. in Grant Parish: A. L. Patterson & Co., New Orleans, \$60,833; Francis T. Constant, Alexandria, La., \$56,920.

Atlantic City, N. J.—Paving St. James st.: Atlantic Construction and Supply Co.: brick, 3 in. thick, \$3.45; 3 1/2 in. thick, \$3.75; 4 in. thick, \$3.92. Bitulithic, \$2.75 and \$2.10. E. L. Bader: brick, 3 in., \$3.49; 3 1/2 in., \$3.70; 4 in., \$3.90. United Paving Co.: bitulithic, \$2.70 and \$2.00. Both brick and bitulithic for Virginia ave. were as follows: E. L. Bader: brick, \$2.70; no bid on bitulithic. Atlantic Construction & Supply Co.: brick, \$2.65; bitulithic, \$2.75. United Paving Co.: brick, \$2.65; bitulithic, \$2.70.

New York, N. Y.—Constructing the transverse road at E. 170th st., in connection with the Grand Blvd. and Concourse, McHarg Barton Co., 165 Eway, lowest bidder, as follows: 16,300 cu. yds. of earth excav., 70c.; 24,800 cu. yds. rock excav., \$1.32; 4,400 cu. yds. filling and back-filling, 1c.; 50 cu. yds. cinder fill, 60c.; 5 M. ft. lumber, \$40; 480 cu. yds. Class "A" concrete, \$8; 4,000 cu. yds. Class "B" concrete, \$5; 25 cu. yds. cinder concrete, \$5.20; 9,300 sq. ft. waterproofing, 4c.; 250 cu. ft. granite newels, fenders and coping, \$3.50; 820 lin. ft. vitr. stoneware pipe drain, 15 in., \$1.50; 400 lin. ft. vitr. stoneware pipe drain, 12 in., \$1.50; 300 lin. ft. vitr. stoneware pipe drain, 10 in., \$1.50; 46 spurs for house connections, \$1; 12 manholes, \$75; 4 standard receiving basins, \$115; 4 Type "A" inlets, \$45; 2 Type "B" inlets, \$35; 2 Type "C" inlets, \$15; 80 sq. yds. paved gutters, \$2; 300,000 lbs. steel and iron, exclusive of railings, 3.2c.; 1,660 sq. ft. woven wire fabric, 6c.; 180 lin. ft. standard water pipe

2 in., \$2; 135 lin. ft. standard water pipe, 0 in., \$3.50; 2,800 lin. ft. new bluestone curb, \$1; 90 lin. ft. new granite curb, \$1.70; 30 lin. ft. old bluestone curb, 35c.; 20,300 sq. ft. cement flag, 23c.; 200 sq. ft. old bluestone flag, 5c.; 600 sq. ft. new bridge-stone, 85c.; 1,050 sq. ft. old bridge-stone, 6c.; 7,450 sq. yds. asphalt block pavt., 2.20; 1,600 sq. yds. macadam pavt., 80c.; 1 lin. ft. Type "A" railing, \$5; 970 lin. ft. type "B" railing, \$2.50; 100 lin. ft. guard all, 40c.; 18,300 sq. ft. surface treatment of concrete, 4c.; maintenance of traffic and leaning up, lump sum, \$1,000; total, \$111,445; totals of other bids: Leahy Cont. & Constr. Co., \$138,053; McDonald & Barry, 125,300; J. B. Malatesta, \$130,745; Godwin Constr. Co., \$131,705; T. Crimmins Contr. Co., \$129,298; T. J. & G. L. Brown, \$143,477; J. C. Rodgers, \$130,170; A. J. Schwartzler, \$118,591; Burnside Contr. Co., 122,985; Rodgers & Haggerty Co., \$122,932; Voorhies, Sullivan Contr. Co., \$118,449; Handy Bros. Contr. Co., \$117,899; following are the totals of the lowest bid on other streets: Paving with asphalt on concrete foundation, Hastings Pavt. Co., 25 broad st., bid for Kingsbridge rd, from erome ave. to Preston st., \$8,708; E. 166th run Webster ave. to Morris ave., \$11,802, and E. 178th st., from Burnside ave. to park ave., \$4,231; for paving with sheet asphalt, Freeman st. from Stebbins ave. to Intervale ave., Asphalt Constr. Co., Madison ave. and 137th st., bid \$7,936; and regulating, grading, flagging, etc., Van Cortandt ave., from Moshulu Parkway to Jerome ave., De Manna & De Paola, \$4,722.

Oklahoma City, Okla.—Paving with asphalt Linwood blvd., (a) from 10th st. and Pennsylvania ave. to 16th st. and Pennsylvania ave., estimated cost, \$140,000; (b) from 16th st. and Pennsylvania ave. to Grand blvd. and Linwood ave., estimated cost, \$60,000; Swatek & Parker, (a) and b) \$2.24 per sq. yd.; Severens Paving Co., a) \$2.15, (b) \$2.17; Western Paving Co., b) \$2.25.

Madison, Wis.—Paving with creosoted block Webster st. and brick on E. Wilson st., Nicholas Quinn, lowest bidder, \$7,956 and \$11,995, respectively; with asphalt on State st., John Blake, \$30,000; with asphalt on Park st., Andrus Asphalt Co., \$10,015; with creosote block E. Johnson st., John Cullinane, at \$16,709.

SEWERAGE

Ozark, Ala.—Citizens have voted \$15,000 bonds to install sewers.

Ansonia, Conn.—Sewer Commission is planning extension of the sewer system through First Ward. Vincent B. Clark, City Engineer, will prepare the plans.

Windsor Locks, Conn.—J. E. Egan & Son have completed plans for construction of proposed sewer system.

Albany, Ga.—Citizens will vote June 12 on \$100,000 bond issue for extension of sewer system, erection of gas plant, paving streets in business section, opening new streets, and enlargement of park and cemetery.

Blackshear, Ga.—Town is considering construction of sewer system.

Ft. Valley, Ga.—Bids will be received June 15 for \$15,000 sewerage, \$5,000 water works and \$20,000 school bonds.

Savannah, Ga.—Extension and improvement of the storm water drainage system is being considered.—John W. Howard, City Engineer.

Sylvester, Ga.—City is considering \$20,000 bond issue for extension of sewer system and water mains.—T. J. Bridges, Mayor.

Unadilla, Ga.—Citizens will vote June 15 on \$15,500 bonds for sewer construction.

Goshen, Ind.—Plans are being prepared and bids will soon be asked for construction of sanitary sewer system beginning in North 5th st.

Valley Junction, Ia.—The Iowa Engineering Co., Clinton, has completed plans for seven miles of sanitary sewer and disposal plant; cost, \$40,000.

Nashville, Mich.—Council has decided to construct sewer in section of village.

Reed City, Mich.—Mayor M. W. Brown has secured Engineer to plan erection of disposal plant.

Albany, N. Y.—Board of Contract and Supply has selected Rudolph Hering, of New York City, as engineer for proposed intercepting sewer.

Newburgh, N. Y.—City Engineer Blake is to prepare plans and specifications for sewer to border and cross Erie property on south and east of Washington Heights.

Schenectady, N. Y.—Bids will be asked by Board of Contract and Supply for building sewers in Baker ave. from Eastern ave. to City line.

Charlotte, N. C.—Citizens will vote July on \$865,000 bonds for sewer work and other improvements.

Clinton, N. C.—Citizens voted \$30,000 sewer and water bonds.

Niles, O.—Council has decided to construct street sewers on portions of four streets.

Reading, O.—Citizens will vote July 30 on \$20,000 sewer bonds.

New Philadelphia, Pa.—Citizens will vote June 5 on \$140,000 bonds for installation of about 12 miles of sanitary and three miles of storm sewers and a disposal plant.—G. E. Arnold, City Engineer.

Philadelphia, Pa.—Citizens have voted \$50,000 loan for reconstruction of Conocock-sink Creek sewer and \$160,000 for construction of main sewers.

Forney, Tex.—Citizens will vote June 5 on bonds for construction of sewer system.

Colfax, Wash.—City is about to let contract for proposed sewer work, J. H. Miller, City Engineer.

Morgantown, W. Va.—Citizens will vote June 24 on \$100,000 bonds to lay sewers and pave streets.

CONTRACTS AWARDED

Mullan, Ida.—Constructing sewage system to R. M. Bardsen & Co., of Butte, Mont., \$15,714.

Humboldt, Kan.—Furnishing material and constructing a system of sewerage and drainage in Sects. 1 and 2, from plans of J. S. Worley Co., Engrs., Reliance Bldg., Kansas City, Mo., to Launder & Linder, Kansas City, Mo., \$21,410.

East Las Vegas, N. M.—To Thomas McGovern and P. J. Ryan, Pueblo, Col., for construction of sewer system, \$20,663; other bidders: J. A. Pringle, Kansas City, Mo., \$24,347.50; W. F. Dicus, Douglas, Ariz., \$22,800; Rushmore & Gowdley, Hutchinson, Kan., \$23,840; Stokes Construction Co., Oklahoma City, Okla., \$24,952.50; J. C. Huff, Deming, N. M., \$24,200; National Construction Co., McAlester, Okla., \$34,872.50; Foster & Doll, Denver, Col., \$32,261.50; F. J. Gehring, East Las Vegas, N. M., \$29,516; Westcott & Doan Investment Co., Denver, Col., \$32,017; Peter O'Brien Construction Co., Denver, Col., \$25,737.50.

Syracuse, N. Y.—Building Colvin st. trunk sewer extension to Patrick & Kiely, \$51,703.50; building lateral sewers to following: Lancaster ave. sewer, James Swift, \$4,449.50; Livingston ave., James Swift, \$1,223; Sumner ave., Philip Thomas, \$1,294.50; Ackerman ave., Philip Thomas, \$4,066.75; to Jas. Swift for sewer through Dunn and Gore lots, across Hamilton st. and through Schuyler st., \$1,549.80.

Central Point, Ore.—Building sewer system, to Jacobson-Bade Co., 407 Stanton st., Portland, \$64,495.

Centralla, Wash.—Building trunk sewer, to F. A. Kessal, city.

BIDS RECEIVED

San Diego, Cal.—Furnishing f. o. b. San Diego 171,455 ft. 14 to 6-in. vitr. salt glazed sewer pipe and 5,520 yds. different sizes, Pacific Sewer Pipe Co., J. W. Hellman Bldg., Los Angeles, lowest bidder, \$31,542.

Syracuse, N. Y.—Building Colvin st. sewer extension; lowest bid was \$51,703.50, by P. R. Kiely, on specifications for reinforced concrete pipe; for brick, specifications designated as (a), and for concrete, specifications designated as (b). Frank George, Batavia, was lowest bidder, \$54,428.25 on specifications (a) and \$54,748.70 on specifications (b). On specifications (d), calling for concrete block, the lowest bid was submitted by John Davin, Jr., at \$51,888; Albert Gaffey, specifications (a) \$92,595, (b) \$92,295, (c) \$78,965, (d) \$92,595; John Young, (d) \$55,912.50; Samuel Bonn, (a) \$59,758, (d) \$59,019.50, (c) \$60,740.25, (d) \$59,110; Nicholas Marnell (a) \$65,543; Frank George, (a) \$54,128.25, (b) \$54,718.70, (c) \$57,269.45, (d) \$56,457.25; C. T. Hookway, (c) \$74,751; P. R. Kiely (c) \$51,703.50; John Davin, Jr., (c) \$54,888; lateral sewers of the same system were as follows: Lancaster ave. and Pooler st., A. Sperato, \$4,763.20; C. Bonn, \$4,813.75; John Davin, Jr., \$4,968; A. Barr, \$1,605.75; James Swift, \$4,449.50; S. Bonn, \$4,586.25; Philip Thomas, \$4,661.75; C. T. Hookway Construction Co., \$5,243.50; Ackerman ave., John Davin, Jr., \$4,693.50; A. Sperato, \$4,740; C. Bonn, \$4,462; A. Barr, \$4,672; James Swift, \$4,408; Philip Thomas, \$4,066.75; C. T. Hookway Construction Co., \$5,113.50; Sumner ave., C. T. Hookway Construction Co., \$1,579; S. Bonn, \$1,801; A. Sperato, \$1,137.20; C. Bonn, \$1,491; J. Swift, \$1,251; John Davin, Jr., \$1,385; P. Thomas, \$1,291.50; Livingston ave., A. Sperato, \$1,295.30; J. Davin, Jr., \$1,361; S. Bonn, \$1,389.50; C. Bonn, \$1,357; J. Swift, \$1,223; P. Thomas, \$1,233.50; C. T. Hookway Construction Co., \$1,412.50.

Syracuse, N. Y.—Constructing sewer across the Dunn and Gere lots, between Hamilton and Schuyler st., as follows: James Swift, \$1,549.80; Charles Bonn, \$1,918.20; Samuel Bonn, \$3,929.50.

WATER SUPPLY

Hamilton, Ill.—L. P. Wolff, of St. Paul, Minn., is preparing plans for proposed water works.

Peoria, Heights, Ill.—Village is considering bond issue for establishment of water plant; Engineer will be selected to prepare estimates. Jos. Downs is interested.

Clinton, Ind.—City is considering construction of two miles of 4, 6 and 8-in. c.-i. pipe.—Wm. Hamilton, Superintendent of Water Works.

Morocco, Ind.—Council will soon ask for bids for installation of modern water works plant.

Lawrence, Kan.—Lawrence Water Co. is contemplating expenditure of from \$40,000 to \$50,000 this summer in improving and increasing efficiency of system.

Topeka, Kan.—Purchase of 8,000,000-gallon pump is being considered by water works officials.

Baltimore, Md.—New bids will be asked for suction and installation of pump at Mt. Royal pumping station.

La Plata, Md.—G. E. A. Haerley, 511 Equitable Bldg., Baltimore, is preparing survey preparatory to construction of proposed water system.

Boston, Mass.—Council has authorized \$300,000 loan for purchase of equipment for lighting side streets by gas with automatic devices for lighting and extinguishing.

Franklin, Mass.—Town has voted \$50,000 to extend and improve water works.

Biloxi, Miss.—E. C. Castanera, Superintendent of Water Works, has estimated that extension of water works will require 16,000 ft. of 4-in. mains, 45,200 ft. of 6-in. mains, 2,000 ft. of 8-in. mains, 112 new fireplugs, reservoir, two pumps and a fire-house, costing about \$10,000. Citizens will vote June 27 on \$70,000 bond issue.—E. Glennan, Mayor.

Millard, Neb.—Citizens have voted \$10,000 bonds for water works.

Manchester, N. H.—City will install water mains on east and west sides at cost of \$30,000.

Conklingville, N. Y.—State Water Supply Commissioner has made final order approving plan for regulation of flow of upper Hudson River by the construction of a storage reservoir on Secandaga River, near Conklingville, at a cost of \$4,650,000.

Charlotte, N. C.—Citizens will vote July 4 on \$865,000 bonds for water works and other improvements.

Clinton, N. C.—Citizens have voted \$30,000 water and sewer bonds.

Cleveland, O.—Bids will be received about July 1 for construction of proposed water tunnel.

Dayton, O.—Council has voted to acquire land for sinking proposed well and as site for giant underground reservoir, which will be connected with present water-works pumping station by concrete conduit.

East Liverpool, O.—Mayor Samuel Crawford has signed ordinance appropriating \$50,000 for installation of a well system. C. V. Beatty, Director Public Service.

Old Harbor, O.—Installation of \$31,000 water works plant is being considered.

Wanoka, Okla.—Wm. Haviland, Alva, is preparing plans for construction of water works and electric light plant.—C. D. Willard, Town Clerk.

Philadelphia, Pa.—Citizens have voted \$500,000 loan for construction of mill district high-pressure fire main system.

Henry, S. D.—Town is arranging for construction of municipal water system.

Greeneville, Tenn.—Citizens will vote June 5 on \$65,000 bonds for construction of water works and electric light plant.

Haskell, Tex.—Extension of water mains at cost of \$5,000 is being considered.

Nocona, Tex.—City will construct water system at cost of about \$20,000; erect concrete pumping station; steel tower and tank of 50,000 gallons capacity; concrete reservoir, 100,000 gallons capacity. Fountain-Shaw Engineering Co., Dallas, Engineers.—Walter Hodges, Mayor.

Yorktown, Tex.—City will install 6-in. pipe for water mains extension; cost, \$6,000.—L. W. Hoff, Mayor.

Santaquin, Utah.—Town is considering bond issue for establishment of water system.

Point Pleasant, W. Va.—Council of North Point Pleasant has passed ordinance providing for \$6,000 bond issue for construction of water works.

Shinnston, W. Va.—Citizens have voted bonds for improving of water works, sewers and streets.

Montreal, Que., Can.—Plans and specifications have been completed for six-acre final sand filter plant for the Montreal water works; it is expected that specifications will be printed and tenders formally called for by Board of Commissioners, City Hall, during the first few days in June, tenders to be opened about five weeks

later, also that plans and specifications for filtered water reservoir and preliminary filters will be completed during latter part of June, ready for advertising.—Geo. Janin, Chief Engineer, Department of Public Works; Hering & Fuller, New York City, Consulting Engineers.

CONTRACTS AWARDED

Tucson, Ariz.—Building reinforced concrete standpipe, 1,000,000 gals. capacity to the Concrete Constr. Co., of Tucson; the structure is to be 90 ft. high by 45 ft. diam., with dome-shaped roof; the plans were prepared by L. A. Waterbury, Tucson.

Sacramento, Cal.—To Braun, Williams & Russel, Inc., 303 Market st., San Francisco, for erecting steel smoke stack 8 ft. in diameter by 188 ft. high for city.

Pittsfield, Mass.—Laying 10,500 ft. of 18-in. water main from the Farnham dam toward center of city, to Daniel A. Dory, Natick, \$10,018; other bidders: S. Camisia, of West Medford, \$10,474; Crowe & Walsh, of Pittsfield, \$12,456; Spinach Contr. Co., of Waterbury, Conn., \$13,645; Michael Russo, of Boston, \$14,148; Winston & Co., of New York, N. Y., \$16,762; Andrew Cusack, of Boston, \$17,693; Danis O'Riley & Co., of Pittsfield, \$20,723.

Lakewood, O.—Erecting steel water tower to Des Moines Iron & Bridge Co., Pittsburg, Pa., \$13,560.

Sapulpa, Okla.—Building water system to cost \$230,000, to Southwestern Engineering Co., Oklahoma City.

Willamina, Ore.—To Jacobson-Bade Co., Portland, for constructing water works.

Springdale, Pa.—Constructing 33,660 lin. ft. sewers, 35,660 lin. ft. c. i. water lines and a 350,000-gal. capacity reservoir, etc., from plans of Engrs. Douglass & McKnight, 1709 Union Bldg., Pittsburg, to McGlathery & Robb, Philadelphia, \$17,993.

Penticton, B. C.—Water works material: to Crane Co. for 10,000 ft. 12-in. pipe steel, lap welded, at \$1.1969, and 400 ft. 14-in. at \$1.6801, and gates for \$3,719; to Simson, Balkwell & Co., of Vancouver, for hydrants, \$2,668; to Canadian Fairbanks Co. for galvanized pipe, \$1,248, and to Drummond, McCall & Co., Montreal, Que., for steel pipe, \$2,850. F. H. Latimer, Consulting Engr., Penticton, B. C.

LIGHTING AND POWER

Fayetteville, Ark.—Fayetteville Electric Light & Power Co. will enlarge plant and install new machinery, cost \$20,000.

Oneonta, Ala.—D. M. Farson & Co., Chicago, Ill., are considering establishment of electric light plant; cost \$6,000.

San Bernardino, Cal.—The Southern California Gas Co. has petitioned Board of Supervisors for franchise for a period of five years to construct gas mains and laterals on all the roads within county; about \$100,000 will be expended first year.

Wilmington, Del.—Street and Sewer Department is testing street lighting system, whereby arc lights are replaced by numerous incandescent lamps strung along streets.

Wilmington, Del.—Street and Sewer Directors are seeking cost of conduit to carry all wires underground on Market st.

Blackshear, Ga.—Town is considering construction of electric light plant.

Manito, Ill.—Erection of a new power station for municipal electric light plant is being considered.

Terre Haute, Ind.—The Citizens' Heating Co. will soon ask for a heating plant to be located on Tippecanoe st.; also for laying main in Tippecanoe st.

Humboldt, Ia.—Northern Iowa Power Co., Humboldt, has been incorporated to operate light, heat and power plant; capital, \$1,000,000. N. T. Guernsey, F. A. Brown, A. G. Ripley and others, all of Des Moines, incorporators.

Lafayette, La.—Superintendent W. L. Eryls of Electric Light and Water Works has recommended that plant be changed from direct current to alternating system; improvements planned will cost \$40,000.

Boston, Mass.—Council has accepted legislative act authorizing city to borrow \$1,000,000 for installation of high-pressure water system.

Eveleth, Minn.—Bids will be asked for installation of four white way standards on Pierce st.

Rochester, Minn.—Earle D. Jackson, St. Paul, is preparing plans for street lighting system.

Miss Point, Miss.—F. Lynn Brown, Chicago, will at once erect \$150,000 gas plant.

Belton, Mo.—Citizens have voted to construct electric light system.

St. Louis, Mo.—Arcadia County Club will construct a dam and hydro-electric plant; cost \$50,000.—Dixon-Smith Engineering Co., 818-820 Wright Bldg., St. Louis, Mo., Consulting Engrs. Henry C. Muskoff is Landscape Engineer.

Billings, Mont.—Steps toward the erection of an improvement district for decorative lighting purposes have been taken by council.

Albany, N. Y.—Municipal Gas Co. has accepted city lighting contract and proposes to enlarge and improve plant on Trinity Place for generating sufficient electrical power to supply city and commercial supply.

Rockville Centre, L. I. N. Y.—Citizens have voted \$11,000 bonds for addition to the electric light plant. F. G. Hooley, Village Attorney.

Syracuse, N. Y.—Public Service Commission of the Second Department has authorized the Syracuse Lighting Company to issue additional bonds to amount of \$456,000 for general extension and improvement work in both gas and electric service.

Glen Ullin, N. D.—C. E. V. Draper, Mandan, has petitioned Council for franchise to install electric light plant.

Greenspring, O.—D. M. Scott has been granted franchise for 25 years to operate electric light and power plant.

Pleasant City, O.—The Midland Power & Traction Co. will extend lines to Pleasant City in near future.—W. A. Gibbs, Cambridge, General Manager.

Wanoka, Okla.—Wm. Haveland, Alva, is preparing plans for installation of electric light plant.—C. D. Willard, Town Clerk.

Claysville, Pa.—Council has granted franchise to the Claysville Electric Light, Heat & Power Co. A. C. Whitaker, Wheeling, W. Va., and M. G. Hertzog, Claysville, are interested.

Edgefield, S. C.—Citizens have voted \$15,000 bonds to establish electric system.

Faith, S. D.—Mills & Harrington will construct 100-kw. electric light, heat and power plant; cost about \$10,000; steam equipment is needed.—M. E. Brookman, Eagle Butte, S. D., Engineer.

Gallatin, Tenn.—City let no contract May 5 for supplying Corliss engine, two 100-kw., 3-phase engine-type generators, two marble switchboards and two electrically-operated pumps of 500 gals. capacity per minute; specifications will be changed and new bids called for.—L. Anderson, Chairman Water and Light Commission.

Greenville, Tenn.—Citizens will vote June 5 on \$65,000 bonds for construction of electric light plant and water works.

Knox City, Tex.—R. W. Warren and associates have decided to construct electric light plant.

Radford, Va.—Dominion Power Co., Radford, has been chartered by State Corporation Commission to operate water, electric, steam and other power plants.—J. J. Mott, Statesville, N. C., President.

CONTRACTS AWARDED

Jacksonville, Fla.—To the James N. Bruin Company for building certain portions of new electric light power station, which the city is arranging to erect on Talleyrand ave.

Uxbridge, Mass.—Building electric light plant addition for Worcester Suburban Electric Co., to E. W. Ward & Co., Worcester.

Barberton, O.—Council has passed resolution accepting bid of the Sun Vapor Street Light Company, of Canton, for lighting streets of the city for period of three years.

Ogden, Utah.—By Merchants' Light & Power Co., Ogden, which has recently been granted franchise for the lighting and power, and which has also obtained the municipal arc lighting contract to the Falkenau Electrical Construction Co., of Chicago, general contract for the complete installation and construction of system. Work will be undertaken immediately and pushed to rapid completion.—H. A. Strauss, Consulting Engineer. Stock Exchange Bldg., of Chicago, has prepared plans and specifications for system and is now engaged in making the necessary purchases.

FIRE EQUIPMENT

Los Angeles, Cal.—Establishment of fire station in Wilshire District is being urged.

San Francisco, Cal.—Fire Chief Murphy is advocating motor chemical engines and auto for Battalion Chief.

Hartford, Conn.—Fire Board proposes to expend \$65,000 for erection of fire house, \$6,500 for water tower and \$4,000 for rebuilding Truck No. 1.

Boise, Ida.—Citizens will vote on \$35,000 appropriation to purchase 80-ft. hook and ladder truck, 3,000 ft. of hose and 50 fire alarm boxes; also minor equipment.

Fredport, Ill.—Citizens will soon vote on \$15,000 bonds to purchase fire apparatus.

Decatur, Ind.—Business men of city have decided to erect fire house and equip it with combination auto truck, hose cart and chemical engine.

Fort Wayne, Ind.—Board of Public Safety has decided to ask bids for 500 ft. of fire hose.

New Albany, Ind.—Site at Culbertson ave. and Thomas st. has been purchased for erection of reel house for fire department.

Toileston, Ind.—Council is considering erection of fire station on Ridge road.

Lewiston, Me.—Board of Fire Commissioners has recommended purchase of auto fire truck.

Blackstone, Mass.—Fire department has been organized.—John H. Dwyer, Chief.

Holyoke, Mass.—Fire Commissioners have voted to secure a 35-ft. ladder aerial truck at once, appropriation being available.

Lawrence, Mass.—Chief Engineer D. E. Carey has recommended purchase of 3,000 ft. of 2½-in. hose and at least two wagon guns.

New Bedford, Mass.—Board of Fire Engineers has voted unanimously to recommend to Council purchase of automobile for Chief Dahill.

Waltham, Mass.—Board of Aldermen is considering \$2,000 auto wagon for Chief Johnson.

Lansing, Mich.—Fire Chief H. R. Delfs has recommended purchase of 2,000 ft. of hose, 15 fire alarm boxes, 6 circuit repeaters for alarm system, auto truck for use of electrical department, also erection of fire station.

Norway, Mich.—Town is considering purchase of equipment.

Eveleth, Minn.—City is planning to erect two-story \$10,000 fire hall.

Laporte, Minn.—Town is considering purchase of auto fire truck.

St. Joseph, Mo.—Fire Chief P. P. Kane has recommended erection of fire station at 6th and Jule sts., rebuilding of hook and ladder house at 7th and Charles sts., erection of new fire houses at 4th and Sycamore where city has a lot, and one in eastern part of city, somewhere between Faraon st. and Mitchell ave.; better fire protection in South St. Joseph, new, up-to-date aerial water tower, new hose wagon for No. 2 fire house, and placing all wires underground within the first-class fire limits.

Bordentown, N. J.—Resurfacing Farnsworth ave. to Thos. J. Barrett, city, \$8,188.

Rochester, N. Y.—Goldsmith place, asphalt pavement from Troup to Spring sts., to Whitmore, Rauber & Vicinus, \$2,599; Depew st., asphalt pavement, Rochester, to Vulcanite Pavement Company, \$14,512; Nellis Park, asphalt pavement, to Whitmore, Rauber & Vicinus, \$6,895.25; Kenning alley, asphalt pavement, to Whitmore, Rauber & Vicinus, \$2,984.80; Heberling alley, asphalt pavement, to Whitmore, Rauber & Vicinus, \$1,148; Agnes st., sewer, cement walks and grading, to W. H. Madden, \$3,141.30; C'een st., sewer, walks and grading, W. H. Madden, \$3,177.30; Harvard st., sewer, John Petrossi Company, \$168; Anthony st., cement walks, to Crouch Brothers, \$630; Hoffer st., brick pavement, to

F. C. Lauer & Sons Company, \$4,080.

Cincinnati, O.—To R. E. Cash, to improve Bond road from Montgomery pike to Carriage pike, \$15,500; to E. Robinson, to repair Colerain pike from Mount Airy to Poole road at estimated cost of \$5,893, and for improving Compton road \$1,952; macadamizing Struble road to H. E. Steele, \$4,053.

Youngstown, O.—Bruce st. paving to Turner & Olsen, \$7,219; Grace st., paving, to Miller Brothers, \$2,800.50; Floral avenue sewer, to E. Dioro, \$745.50; Hawthorn, sewer, to E. Dioro, \$543.12; Clifton ave., grading, to Shook & Gray, \$1,832.12; Ayers st., grading, to M. P. Connelly, \$755.

Fort Worth, Tex.—Paving Allen ave., North and other streets, to Texas Bitulithic Co., \$2,034.

Dallas, Tex.—Grading Bishop st., to A. F. Moberly, \$3,551.70; other bidders were: Doty & Conley, \$3,659.48; Rex Tune, \$3,759.75; Cullom & Bavouset, \$3,985.33; M. C. Shipley, \$4,061.53; Will Coats & Co., \$4,515.70.

Tacoma, Wash.—Paving work in Local Improvement District No. 434, to Keasal Construction Co., \$59,471; estimate, \$68,729; grading Madison and Monroe sts., to Galluci & Rose, \$5,973; paving with concrete alley between G and Yakima aves., to Ollar Robinson & Co., \$1,125.

WATER SUPPLY

Laporte, Ind.—City has authorized preparation of plans for auxiliary water plant on shore of Stone Lake.

Sylvan Grove, Kan.—Citizens will vote June 26 on \$35,000 bonds for water works and electric lighting.

Las Cruces, N. M.—Bids will be received by Board of Trustees, July 1, 10 a. m., for \$40,000 bonds for construction of water works.

Price, Utah.—Citizens have voted \$9,000 bonds for extending water system and creating public park.

CONTRACTS AWARDED

Sioux City, Ia.—To U. S. C. I. Iron Pipe & Foundry Co., for 2 cars of 6-ft. pipe and 1 car 10-in., \$24.95 per ton; steel tank and tower, to Kennicott Co., 100,000-gal. cap., \$1,846; gate valve, to Rensselaer Valve Co.; three centrifugal pumps with D. C. motors, to Geo. J. Caldwell & Co., \$4,300; two gas-oil pumps and engines, to Fairbanks, Morse & Co., \$2,730.

New York, N. Y.—Construction of deep-pressure tunnel from Union Sq., Manhattan, to Fort Greene Park in Brooklyn, to the Holbrook, Cabot & Rollins Corporation, \$5,272,475; next lowest bid was that of the United Engineering & Contracting Co., \$5,295,218.50; to Mason, Hanger & Co., for construction of tunnel from Burnside ave., Yonkers, to 99th st. and Central Park West, \$3,709,372; next lowest bidder, Grant Smith, Locker & Co., \$3,775,552.

Cincinnati, O.—Laying water pipe to Mount Washington, to J. M. Quill, \$8,931.

Dallas, Tex.—Sinking three Woodbine wells for city, to Sharp & Company, \$2.50 per ft.

Sherman, Tex.—Sinking two additional wells, to Green Well Co., city.

MISCELLANEOUS

Cambridge, Mass.—Mayor Barry has recommended \$8,000 appropriation for erection of office building and other improvements at Cambridge cemetery.

Saginaw, Mich.—Park Board has decided to ask for new bids for erection of waiting room at entrance to Forest Lawn Cemetery; estimate, \$11,000.

Harrisburg, Pa.—Board of Public Works has selected James H. Fuentes as Consulting Engineer of river front and Paxton creek improvements.—William Jennings, President.

CONTRACTS AWARDED

Haddonfield, N. J.—Removing garbage, to Marmaduke Still, Lawnside.

PROPOSALS

BRICK AND GRANITE BLOCK PAVING

Portsmouth, N. H.

The Board of Public Works, Portsmouth, N. H., asks proposals for the following brick and granite block paving on a concrete base:

Furnishing and laying about 1,540 lineal feet of straight edgestone;

Furnishing and laying about 510 lineal feet of circular edgestone;

About 7,890 lineal feet existing edgestones to be reset;

About 14,250 square yards to be made in preparing roadway excavations;

About 14,250 square yards concrete base to be furnished and laid;

About 3,200 square yards granite block paving to be furnished and laid;

About 11,050 square yards brick block paving to be furnished and laid.

The proposal, with certified check for \$250.00, is to be left at the office of the Board of Public Works, before 12 o'clock noon, of June 5, 1911.

J. E. PARKER,

Engr. & Supt.

(24-31)

ENGINES, BOILERS, GENERATORS AND SWITCHBOARD EQUIPMENT

Dyersburg, Tenn.

Sealed proposals will be received by the City Water and Light Department, Dyersburg, Tenn., until noon, June 13, 1911, for engines, boilers, generators and switchboard equipment for additions to the electric light plant.

Specifications furnished on application to the department or to M. W. EWELL, (24-31) Mayor.

City of London, Ontario

Engineering Department

Applications are invited by the City Council for the position of Assistant City Engineer of London. Such applications must be enclosed in plain envelopes and marked "Assistant City Engineer," and filed with the City Clerk not later than five o'clock on Thursday, June 1, 1911. A full statement of qualifications and references must also be enclosed.

S. BAKER,

City Clerk.

(26-31)

CIVIL SERVICE

NEW JERSEY CIVIL SERVICE

COMMISSION

Trenton, N. J.

Examination will be held as follows:

On June 15th—

Traffic Inspector—Public Utility Commission, salary \$1,800 per annum. Open to candidates between the ages of 25 and 40 years.

Inspector of Gas and Gas Meters—Public Utility Commission, salary \$2,500 per annum.

Applications must be filed up to noon, June 12th, 1911.

For particulars address

GARDNER COLBY, Chief Examiner. Civil Service Commission, Trenton, N. J.

Junior Engineer—The United States Civil Service Commission announces an examination June 14 to fill vacancies in the position of junior engineer Water Resources Branch of the Geological Survey. Salaries \$900 to \$1,200, with expenses when on field duty. Form 1312.

HORTENSE PLACE, ST. LOUIS, SHOWING PROVISION FOR INCREASE OF ROADWAY AND SIDEWALK TRAFFIC

STREET STANDARDS AND "ELASTIC" STREETS

Street Planning to Provide for Both Present and Future—Scientific Calculation of Traffic Requirements—
Initial Provision for Widening Roadway and Sidewalk

Papers before National Conference on City Planning by JOHN NOLEN and B. A. HALDEMAN

STANDARDIZED STREET WIDTHS

By JOHN NOLEN

PERMANENT progress in city planning will not result usually from spectacular schemes for the sudden transformation of our cities, nor from revolutionary programs and proposals. Advances will come more often from a patient but open-minded and scientific study of such problems as are represented by the title of this paper, followed by a close co-ordination of one subject with another in a comprehensive plan, thus recognizing the unity of the city and the inter-relation of all its parts.

At the present time an average of 20 to 40 per cent of the total area of cities is devoted to streets, rising in the case of Washington, D. C., to 54 per cent. Therefore, even a slight variation in the width of the streets of a city becomes a mat-

ter of importance, not only in the area of land involved, but also in hindrance to traffic caused by too narrow streets and the enormous sums required for future widening.

Some students of this subject are of the opinion that the existing difficulties connected with street widths are due, in part at least, to the fact that city councils or other municipal authorities have heretofore fixed upon a certain number of feet, usually 40, 50 or 60 feet, as standard widths for all streets. Undoubtedly such action has proved a handicap to many a city. Not standardization itself, however, but the arbitrary and unintelligent character of that standard is the evil, and the remedy is not the abandonment of all standards, but the adoption of more intelligent standards.

It would seem that street widths could be satisfactorily standardized because the facts upon which such widths rest

are capable of definite classification and it is practicable to collect scientific data concerning these facts, and from these data to reason to sound conclusions with a considerable degree of confidence.

The facts which should determine street widths are: (1) The width required for "a line of vehicles," thus fixing roadway units; (2) the width required for "a line of pedestrians," thus fixing sidewalk units; (3) the classification of the streets of a city according to the traffic requirements put upon them, or the other functions that they are to serve; and (4) an estimate of the present and future traffic of the streets of any given class, the width required to meet that traffic, and then the standardization of that width.

(1) It is not yet possible to fix with scientific accuracy the width required for a line of vehicles, partly because the data as to the actual average width of present day vehicles are inadequate, and partly because that width is just now in process of change, due mainly to the increasing size and use of the motor truck. Nevertheless, the conclusions on this point are already fairly definite. One set of investigators holds that 9 feet or thereabouts should be fixed as the width required for a line of vehicles, basing their opinion upon the fact that some motor truck bodies to-day have a width of 8 feet and that the tendency of manufacturers is to increase the width of trucks. The margin for safe clearance, taking into account average skill in driving, would require about another foot for each line of vehicles, making the total width 9 feet. Other investigators find that to-day very few vehicles, even large motor trucks, measure more than 6½ or 7 feet in width, and that conditions of construction or laws are likely to place a limit upon advantageous width close to 7 feet. This view has the support of some of the vehicle companies who hold, in the interest of the manufacturer as well as of the public, that 6½ or, at most, 7 feet should be the maximum width.

As a matter of fact, not only the width of vehicles but also the load is likely to be standardized by law, so that the engineer, landscape architect, or city planner will have a definite maximum figure to work with. These limits may have exceptions, but the exceptions should be discouraged by a vehicle license tax, which would increase very rapidly on vehicles above certain dimensions.

In addition to the space required for vehicles, allowance must be made on many streets for electric cars. Assuming double tracking, which is the most economical method usually, this allowance should be not less than 20 feet.

(2) Various methods have been devised and followed for determining the width of sidewalks. The most customary is to make the sidewalk some fixed proportion of the roadway, in some cases one-half, in others one-third. The latter appears to represent the most frequent practice and has proved fairly satisfactory. This method, however, appears arbitrary and, in some instances, would be unsound, because the use of the sidewalks does not necessarily increase and diminish with the amount of traffic on the roadway. Adopting the plan used for streets and fixing the width for a line of pedestrians at 2 feet, this allows for ten lines of pedestrians on a 20-foot sidewalk. The proper width of sidewalks, the method of determining that width, and a more rigid control of encroachments upon sidewalks, all deserve more attention than they have heretofore received.

(3) The classification of the streets of a city according to the traffic requirements put upon them or the other functions that they are to serve is, of course, one of the fundamental requirements of any attempt to standardize street widths. European countries have made such classifications. The London Traffic Commission made five divisions, as follows:

Main avenues.....	140 feet
First class arterial streets.....	100 feet
Second class streets.....	80 feet
Third class streets.....	60 feet
Fourth class streets.....	40 to 50 feet

No street was to be less than 40 feet. This standard classification, applying to London and its suburbs, is a great advance over the London Building Act of 1894, which put the average width of streets "in the public interest" at 40 feet clear or 20 feet from the centre of the roadway to the nearest external wall; and the Council could not require a greater width than 60 feet.

The standard classification for German cities of the second size, cities like Leipzig and Frankfort, is as follows:

Main thoroughfares.....	85 to 118 feet
Secondary thoroughfares.....	50 to 80 feet
Local streets.....	35 to 47 feet

A Prussian law, in force since 1875, apparently drawn to meet the requirements of Berlin, fixes the following dimensions for the laying out of new streets and for the alteration of old ones:

Main thoroughfares.....	95 feet or over
Secondary thoroughfares.....	65 to 95 feet
Local streets.....	40 to 65 feet

The width of streets in different American cities varies greatly. There are very few that have adopted standards for the classification of streets according to traffic requirements. Probably the best classification is that of Washington, D. C., which is as follows:

Main thoroughfares.....	160 feet
Secondary thoroughfares.....	120 feet
Local streets.....	60 to 90 feet

The German city standards, given above, appear to be more reasonable and logical than those of London or Washington, and there is a distinct advantage in having more or less range within each classification, as against fixing the width hard and fast to a single figure. It ought to be practical to classify most of the streets of a city either as main thoroughfares, secondary thoroughfares, or local streets, and to apply to them one of the standard widths adopted for their respective classifications.

(4) To determine such classification, however, requires an estimate of the recent and future traffic requirements of the streets of any given class. It does not seem wise to begin by fixing the width of a street at, say, 50 or 60 or 100 feet, and then apportioning that width as favorably as may be between roadway and sidewalk. It is better to begin at the other end and try to decide what traffic capacity in roadway and sidewalk the street should provide for, thus determining which class it falls in; and then, applying the unit of measurement adopted for car lines, for vehicles, for pedestrians, for trees, etc., decide upon the required width. For example, here are three illustrations of this method.

- I. An *average main thoroughfare* is to have, say,

A double-track car line.....	20 feet
6 lines of vehicles, 3 on each side of tracks, 8 feet each.....	48 feet
20 lines of pedestrians, 10 lines on each of the two sidewalks, 2 feet each.....	40 feet
Total for an average main thoroughfare.....	108 feet
- II. An *average secondary thoroughfare* is to have, say,

A double-track car line.....	20 feet
4 lines of vehicles, 2 on each side of tracks, 8 feet each.....	32 feet
16 lines of pedestrians, 8 lines on each of the two sidewalks, 2 feet each.....	32 feet
Total for an average secondary thoroughfare.....	84 feet
- III. An *average local street* is to have, say,

Roadway for 3 lines of vehicles, 8 feet each.....	24 feet
12 lines of pedestrians, 6 lines on each of the two sidewalks, 2 feet each.....	24 feet
Total for an average local street.....	48 feet

These are only averages and are given simply as illustrations the method of standardization proposed and its application. The range of street widths for such a classification might be as follows:

Main thoroughfares.....	from 90 to 180 feet
Secondary thoroughfares.....	from 60 to 90 feet
Local streets.....	from 40 to 60 feet

Such a standardization would naturally differ from city to city as conditions and requirements differed. Its advantages could be twofold; first, in fixing the range of normal street requirements of three or more important classes; secondly, in infinitely and conscientiously trying to determine in advance to which class a particular street belonged. Of course, even with such a classification there would be many exceptions—special streets, having special requirements and, therefore, calling for special provisions. But if no standards whatever are fixed—and this is the important practical point—there is danger that the normal differentiation of the streets of one class from those of another will be constantly overlooked, or that private interests through pressure and influence may succeed in securing action which is in conflict with the public requirements. It was largely to prevent these results that street width standards, in most cases unintelligent and indiscriminating, were adopted by cities in the past. Where no standards whatever have been adopted many illustrations can be found of the abuses that have crept in, particularly the failure to allow sufficient street width for main and secondary thoroughfares.

In the discussion thus far no reference has been made to trees, grass strips or other planting in the streets or of space aside primarily for the adornment of the street or for securing the benefits of light and air and an appearance of spaciousness. Such reference was omitted merely to simplify the subject and bring it within the compass of a brief paper. Of course, trees are desirable not only in residence streets, but also in most business streets. Of the many arguments against the greater use of trees in our business streets, the only sound argument in most instances is that there is no room for them. But as with traffic so with trees. The same method could be applied. If we are to have trees we must determine the width requirements of a line of trees or two lines of trees, or whatever else is needed. Except for temporary effects, it is not good policy to plant trees in a space that is needed for roadway or sidewalks; nor is it good policy to plant one or more lines of trees in a space that is inadequate for their successful growth. If, for instance, it is decided that a street is the minimum space in which a line of trees of a given species can flourish, then we should standardize that width for that species of tree and provide it. Exceptions there would undoubtedly be to standards for trees as for roadways and sidewalks, but they would be recognized as exceptions and justified because of exceptional conditions.

The traffic and use of many city streets increase from year to year, tending to shift some streets from one classification to another. How to provide a method of meeting this increase is a difficult question to answer. The utmost foresight must be exercised and then adjustments and widenings made to meet new conditions. The problem is how, by the exercise of skill and foresight, to design and arrange streets to fulfill their functions and then from time to time how to re-design and re-arrange them to meet new requirements. In the case of streets where increased traffic is expected, the most practical method of providing for it, perhaps, would be to reserve the extra space between the roadway and sidewalk, or in the center of the roadway, or between the sidewalk and the buildings, utilizing this space temporarily as an area planted with trees and shrubs or merely with grass.

The evils that might follow from the adoption of an indiscriminating set of standards or from an unintelligent application of a discriminating set, have not been overlooked. They might be serious. But it is my opinion that under our present organization such evils would ordinarily be less than

those that almost inevitably follow from a lack of any established standards and from the policy of determining street widths piecemeal as each is presented for decision.

STREET WIDTHS AND SUB-DIVISIONS

Standards of Widths Universal—Change of Desirable Widths with Traffic Development—"Elastic" Streets Provide for This

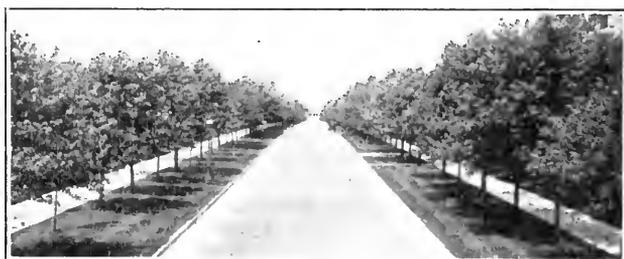

By B. ANTRIM HALDEMAN, Ass't. Engineer, Bureau of Surveys, Philadelphia

It is generally agreed that the healthy, progressive development of a city depends primarily upon the opportunities offered by the street system for unlimited and untrammelled circulation, and the experience of all large industrial cities has been that the demand for better and greater facilities for such circulation is increasing more rapidly than means for supplying it can be found; therefore, the wise determination of street widths is one of the most important of the practical and economic problems of city planning and should be subjected to a much closer study than has heretofore been the practice of town planners.

The failure of streets in the busiest sections of large industrial cities to provide adequate facilities for general circulation, and the wastefulness of unused street areas in other sections of the same communities, are too well known to need any lengthy comment. Although much of the annoyance, waste of time and energy, and pecuniary loss due to congestion of traffic and lack of rapid transit on the one hand, and the uselessness, extravagance and unloveliness of barren areas on the other, may be traced to unwise street planning, it is doubtful whether any amount of human skill, wisdom and foresight can entirely eliminate the danger of the recurrence of these unfortunate conditions. The future requirement of a street is a dark mystery which only time will fully reveal; replanning and rebuilding will probably always remain municipal liabilities; but although our prevision may not be sufficiently unerring to enable us to fully anticipate the future the knowledge gained by unfortunate experience should make us more cautious and painstaking in our study of the problem and should enable us to plan streets which will not be entirely wasteful and ugly during the period when their ultimate destiny is uncertain and yet will have a reasonable prospect of successfully meeting every demand of the years to come.

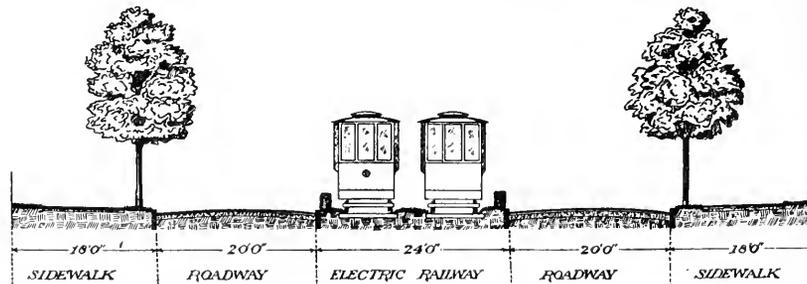

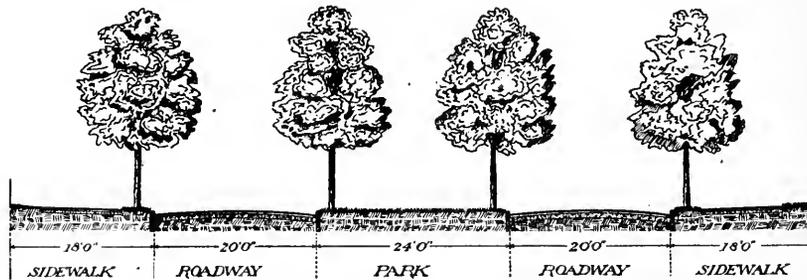

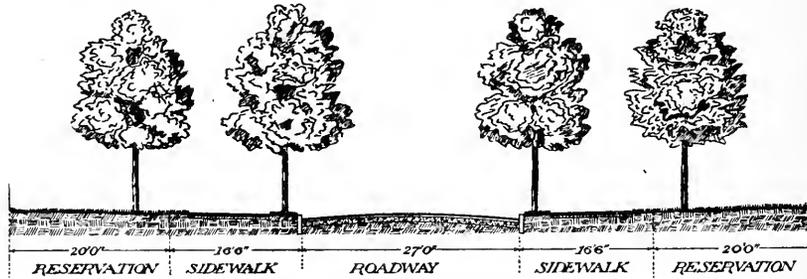

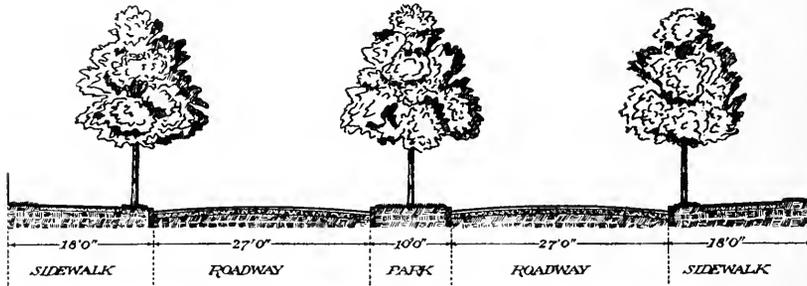

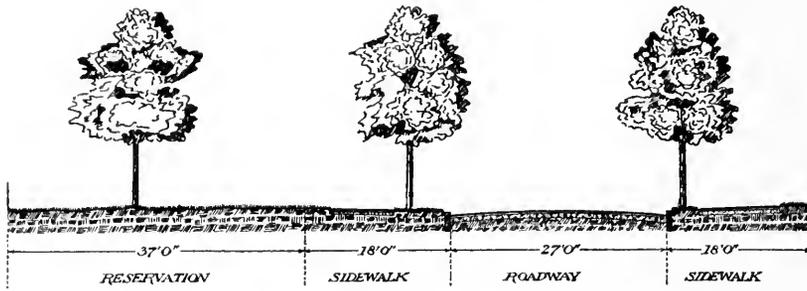

That "there is nothing new under the sun" is as true of street planning as of other things. The street planner has the physical example of every width and form of development to choose from, from the narrow unloveliness of the back alley to the splendid breadth of the Avenue du Bois de Boulogne; whether standards be established or not, his judgment, wisdom and skill will be the true measure of his success in the final analysis of the problem, and it is much more necessary that complete power over the establishment and maintenance of streets be vested in able and responsible hands than that their widths should be either standardized or de-standardized.

There seems to be an abundance of reasonable argument both for and against the standardization of street widths and

WASHINGTON TERRACE, ST. LOUIS

SUGGESTED CROSS SECTIONS~ONE HUNDRED FOOT STREET.

CITY OF PHILADELPHIA
BUREAU OF SURVEYS
GENERAL PLANS DIVISION
JANUARY 1911

J.M. RITCHIE

CROSS-SECTIONS OF STREETS, ARRANGED FOR VARIOUS REQUIREMENTS.
Suggested by B. A. Haldeman, Asst. Engineer, Bureau of Surveys, Philadelphia.

There is no doubt that our street planning methods can and should be improved, but until there shall be a larger consideration for the general public welfare in methods of land development and a strong central authority which can effectively control such development we cannot hope to be very successful in reducing street planning to an economic or scientific basis. The most successful experiments which have been carried out under modern economic theories of town planning have been where the proprietors of large tracts of land, or municipal governments such as exist in some of the cities of Europe, have been able to absolutely control the character of the improvement and the number and kind of buildings to be erected; such control does not obtain in American cities and cannot obtain without the enactment of restraining laws which would be violently opposed by property owners as restricting their right to do as they please with their property; we will, of course, have such laws in time, but the time is not yet, and until we have them our safest course of procedure is our present practice, exercised with a greater degree of judgment, discretion and firmness.

If there has been one influence more potent than any other in the establishment of street widths in American cities it has been the influence of standards, unconscious and unintentional, perhaps, and the result of long established custom, but yet standards. Most of our cities have a comparatively limited variety of street widths, or standards. Eastern cities, as a rule, have a greater variety than western ones, and where their use has been found to be economical and generally satisfactory in practice, standardization is a success, elsewhere it is a failure. That it is at least a partial failure in most cases seems evident in the fact that this Conference is treating it as a serious problem, but its failure may be due to the unwise distribution of the various widths.

If we eliminate streets less than 40 feet in width, which are no longer permissible here, Philadelphia has been a standardized city since its foundation. William Penn's standard was 60 feet, but he laid out one street of each of the widths of 60, 100, and 113 feet. For a longer time than the oldest resident can remember new streets have been 40, 50, 60, 70, 80, 100 and 120 feet in width, the two latter widths being exceptional and applied to few streets, while 50 and 60 feet have been the widths most frequently used. These widths have not been established by any law but have resulted from long established custom; they are standards, and if applied with proper judgment and discretion should give as good results as any scheme of standardization.

The suggestion has been made that streets might be classified and standardized as follows:

Main thoroughfares	from 90 to 150 feet
Secondary thoroughfares	from 60 to 90 feet
Local streets.....	from 40 to 60 feet

But this offers such a wide latitude of choice that it seems to lean very far toward de-standardization, since any width from 40 to 150 feet is allowable. The so-called German standards are subject to the same objection, while those of Washington and those recommended by the London Traffic Commission, although they establish definite widths, ignore many widths which seem both desirable and economical.

It is extremely doubtful whether any sharply discriminating scheme of classification or standardization would be permanently beneficial or economical even if firmly established by law or practice. A street system designed to efficiently fulfill all its functions during a long period of usefulness must be planned far in advance of improvements; and, in the absence of any power to control such improvements, the planner cannot predetermine their class or character in any given locality. The development of a new town or a new suburb always begins with the erection of dwellings, whether the streets be wide or narrow and whether planned to be industrial or residential. After the community has attained a substantial growth gradual changes come through natural causes; the residential street may become a business street; the first-class

business street may lose its importance as trade drifts to a more popular locality. This has been the experience of Philadelphia, and probably of every large city. The width of the street has little influence in determining the character of the improvement on abutting property, or even on the flow of traffic. Although Market street is 100 feet wide, Chestnut street, 50 feet wide and one square south, was for many years a much more important business and traffic street and only its congestion has forced trade and traffic from it into Market street. The section that held the homes of the best families a hundred years ago is now occupied largely by the foreign element and part of it has become slums; the best families have moved westward, beyond Broad street, and they are now being driven out of that section by the resistless tide of trade. Although Washington street, Boston, is very narrow its great importance as a business and traffic street is undeniable.

Mr. Robinson strikes the keynote of the objection to standardization when he says that "it results in misfits and means extravagance and maladjustment," (See Municipal Journal, page 745, May 24, 1911), but until we have a thoroughly efficient system of control over the sub-division and use of land we must continue to take chances of these misfits and extravagances or we will gravitate to an even worse condition, as intimated by Mr. Nolen (see p. 805 of this issue), when he says that "if no standards are fixed there is a danger of private interests, through pressure and influence, succeeding in securing action which is in conflict with public requirement." This pressure of private interests with sufficient influence to obtain special privileges would become a serious menace wherever any abrupt change from long established practice was attempted. In such a city as Philadelphia, where the only limit to the number of houses which may be placed upon an acre is that each shall have at least 14 feet frontage and 144 square feet of open space, or yard area, attached, the abandonment of standards would have none but disastrous results. Only a few years ago a real estate operator asked that a certain unopened street be reduced from the planned width of 80 feet to 60 feet, arguing that it was a suburban, residential street so far from the center of the city that the greater width would never be required; the request was very properly refused, but it is probable that only the fact that it was upon the confirmed city plan of a standard width common in that section saved it from being narrowed; to-day it is one of the finest, most important, and most heavily traveled streets in that section of the city. This is not an isolated case and results have not always been so happy; streets which have been upon the city plan, but not open, have frequently been narrowed or otherwise changed under the pressure of real estate influences to the very great disadvantage of adjacent property in the subsequent development.

Taking the position that the adoption of arbitrarily fixed standards of width offers little, if any, economy over present general practice, and that de-standardization is not safe where the planning is subject to selfish political or private influence, there yet remain two methods, or, rather, a combination of two methods, which seems to be both practical and economical in its initial application and ultimate results; one is the standardization of units for determining the widths of streets and the other is the "elastic" street.

The standardization of the units upon which the widths of streets may be based appears to be an entirely logical proposition; if definitely established it could not fail to result in large economy; its ultimate efficiency, used in connection with the "elastic" street, would, of course, involve wisdom, skill, and foresight in the planner, and to obtain permanently beneficial results its application must eliminate some of the moments of "inertia" and require much of the "thinking and surveying" so darkly hinted at by Mr. Robinson. The units of measurement suggested by Mr. Nolen are probably ample to satisfy present conditions, but restrictive legislation might be necessary to prevent a future increase in the width of vehicles. As there is no likelihood of any early legislation of that kind it might be wise to adopt 9 feet rather than 8 feet for that unit. The 2-foot unit

for determining the width of sidewalks might not be sufficient for fat men, baby coaches, push carts or wheelbarrows, but they may safely be classed as allowable exceptions.

If the "street beautiful" is to be a factor in the problem, a unit width for planting spaces must be provided. Grass plats in streets seem to thrive only under German municipal regulations or in cities where the property owners have a superabundance of civic pride; even in Paris, world-famed for its beauty, the streets contain no grass plats. Much of the beauty of the old-world cities is due to the scientific planting and care of street trees and if our streets are to achieve the full measure of attractiveness we wish for them we must look hopefully forward to a time when trees and other plants will be properly cared for under municipal authority. To this end there should be a planting space unit of 4 feet for narrow streets and 8 feet for wide ones. These units would fit naturally into the unit schemes for sidewalk or cartway in the event of the abandonment of the planting.

The "elastic" street offers an opportunity for obtaining all the advantages of wide streets with little of their extravagance or wastefulness during the years they are growing to their greatest usefulness; it contemplates a gradual development through various forms from the time it is opened, perhaps as a minor residential street, until the time it may become a great business or traffic highway. It involves in its origin one of two conditions: Opening to the full ultimate width intended for it, or the restriction of building lines to such a distance from the center line as will keep the maximum width presumed to be needed for future use clear of permanent obstructions. The opening to full width may be the most economical in the long run and would be feasible where it might be difficult to obtain a law requiring the observance of re-

strictions. In either case the first form of improvement might be a roadway only wide enough for two vehicles to pass, with narrow footwalks and with grass plats and rows of trees occupying the remaining width, the trees being planted in such locations that they would not be disturbed during subsequent changes. Where restrictions can be effectively applied the original opening need not be more than is necessary for two vehicles to pass, with allowance for pedestrians on either side, say, 16 feet for roadway and 6 feet for each sidewalk; these widths would be governed by the probable use and requirement of the street in the near future.

The adoption of a method whereby fixed units may be used for determining the widths of elastic sub-divisions is suggested as a compromise between the advocates and opponents of standardization. This would provide for a minimum width of the sub-divisions as the first form of development for a minor residential street with the possibility of a future widening to the maximum, if necessary, without great cost, and with the certainty of having an attractive street if it never gets beyond the residential state. This method could be applied to the development of any street, no matter what its width or how established; its adoption would lead naturally and directly, in time, to a logical standardization involving comparatively few widths, possibly not more than four, and those would approximate certain standards now in use in almost every city; its practical efficiency and economy, like that of any other method, would depend upon the wisdom and skill with which it is applied. It involves the accuracy of human judgment, which may be prone to err; but any scheme of planning is subject to the same limitations, for it does not seem possible to lay down any hard and fast rule for obtaining ideal results in the planning of city streets.

CONCRETE METHODS IN ROCHESTER

Retempering Concrete an Advantage, for Certain Purposes at Least—Experiments Showing Strength Increased by Retempering, and Deformation Decreased—Use of Clay for Expansion Joints

AS STATED in our issue of May 31 there has been introduced into the use of concrete by the city of Rochester an idea which will probably seem as revolutionary to engineers as did the change a few years ago from dry to wet mixtures. It has been the common practice to not only specify but stringently enforce that no concrete shall be used which has once taken an initial set and been retempered. The latest Rochester specifications require the use of retempered concrete for binding new concrete to that which has already set, and there is even a possibility that this use may be extended. Assistant City Engineer John F. Skinner two years ago conducted some experiments to determine the effect of concrete on retempering, and, in brief, interpreted the experiments as indicating that retempered concrete was even stronger than that which had not been retempered, providing the retempering be done before final set had begun; also that the retempered concrete did not undergo nearly as great variations in temperature and in volume as did that which had not been retempered.

Experiments to determine the former point were made as follows: Sufficient material for twenty briquettes was mixed up of American Alsen cement, and four briquette molds were at once filled with the mixture. At the end of one hour sufficient material for four briquettes was retempered and the briquettes made with this. Similarly at the end of two hours, three hours and four hours a sufficient amount of the concrete was retempered for making four briquettes. These were tested at the end of seven days, and in each case the result of all four briquettes showed the same kind of result, although, of course, varying in amount. Those which were made of concrete retempered after one hour developed a greater strength than those made of un-tempered concrete; those retempered at two hours showed still greater strength, and those retempered at three hours were the strongest of all.

Those made at the end of four hours showed less strength than those made from the original concrete. The final set of the concrete was found to take place in about 3½ hours. From these tests it appears that if concrete be retempered at any time before final set begins the strength of the concrete is even greater than of that which has not been retempered.

To determine effect of setting upon temperature and change in volume a special appliance was made which consisted of a tin trough or rectangular pan 18 inches long, 4 inches wide and one inch deep. One and one-half inches from each end there was placed in the center of the pan a hole in the bottom ⅜ inch in diameter. Through each of these holes was passed a ¼-inch steel rod which extended 3 inches below the pan, where the end was fixed, and 9 inches above the pan, where the end was free to move and sharpened to a point. At the elevation of the upper ends of these rods a boxwood scale was fastened in horizontal position in such a way that it could be moved a short distance horizontally in order to set one of the rod points at zero. Fitting loosely over each rod was a short tube or thimble of steel which was placed in the concrete with its top extending slightly above the level of the top edge of the pan. In the bottom of the pan was placed a piece of paraffine paper, on this a layer of fine sand smoothed off to a uniform surface, followed by another piece of paraffine paper. This was to permit deformation of the concrete unhindered by its adhering to the bottom of the pan. The pan was then filled with concrete, in the body of which was inserted the bulb of a thermometer which had been wrapped in cotton and waxed paper to protect it. As soon as the concrete was in place the scale was set so that one rod read at zero and the reading of the other taken. This reading was approximately 15 inches. The temperature of the thermometer also was read. After this readings were taken at 10-minute intervals for one hour, and

at 15-minute intervals for four hours more. As the concrete slab was 3 inches above the bottom or fixed end of a rod, and the rod was 12 inches long, any variation in distance between the rods at the concrete was shown increased four times on the boxwood scale. The distance between the rods at the concrete was 15 inches; consequently, the variation in the distance between the rods on the scale showed the change in length of a slab 5 feet long.

This apparatus was used for making a number of tests on neat cement both fresh and retempered, and three to one mortar both fresh and retempered.

In the case of slabs of neat cement the temperature rose in every case during the first 10 to 25 minutes, the total rise during this period being in most cases from 2½ to 5 degrees, although in two cases this was about 6½ degrees. The temperature then fell slowly for from 2½ to 5 hours, reaching from one to 3 degrees below the original temperature, after which it rose again. When the neat cement was retempered before being placed in the pan, the temperature rose more slowly, reaching not more than one degree in the first 20 minutes. In two cases out of five it then fell slowly to several degrees below the starting point; while in the other three cases it continued to rise more slowly than at first for two or three hours, when it again began to fall; the maximum temperature reached being 2¼, 4½ and 7½ degrees respectively.

Where the slabs were made of a 3:1 mixture of sand and cement the temperature, when not retempered, rose slowly for 15 to 30 minutes, but only about ¼ or 1/10 as high as with the neat cement. The mortar which had been retempered showed a fall in temperature for the first two or three hours, after which there was, in most cases, a slight rise. No explanation of this was offered by Mr. Skinner, but it occurs to us that this change in temperature was probably about that which would have occurred with a mortar which had not been retempered, beginning an hour or two after the first mixing; in other words, that the change in temperature continued practically uninterrupted by the retempering.

The change of volume of cement while setting is probably due in part at least to the change in temperature. In the case of the neat cement we find a more or less rapid deformation continuing for from 15 minutes to one hour, after which the deformation was much slower up to about 2½ to 3½ hours, at which time there was a longer or shorter period of decreased rate of deformation. The interval first mentioned was probably that of initial set; that last mentioned, the time of permanent set. In the case of the neat cement retempered, the deformation seemed to continue for a longer time, and to be more irregular.

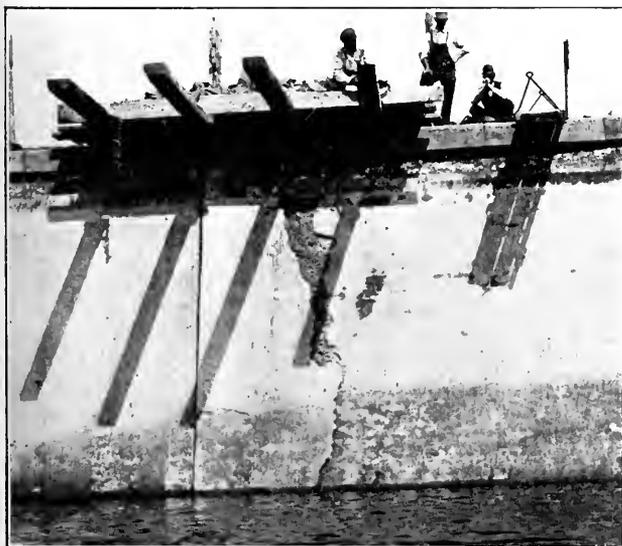

In the case of 3:1 mortar, that retempered showed a more

gradual deformation than the neat, the rate remaining nearly uniform for from 2½ to 3½ hours, at which time it ceased to increase and began decreasing in some cases, in others the volume remained constant after about 3½ hours. In the case of retempered mortar the increase in volume was not so great as with the neat, and after this had reached its maximum it did not appear to be followed by a contraction.

A practical use of retempered concrete was made by the Rochester Engineering Department in connection with the Cobb's Hill reservoir, in which about half an acre of concrete lining of the bottom proved to be somewhat defective on the surface, and this was removed and a patch of retempered concrete applied in place of it. This patch appears to have retained a firm bond on the concrete beneath, although it has been in place for several months. Retempered concrete was also used to patch the wall of the same reservoir at a point where the surface had been broken off in making the expansion joint. This patch also, although it has been on for a year or two, appears to have adhered firmly throughout.

In the Cobb's Hill reservoir just referred to a method was employed for making water-tight expansion joints, of which there were about 180 in the wall. The wall was constructed of blocks 20 feet high, 20 feet long and 14½ feet thick at the base. A tongue and groove joint between the blocks was formed by setting a narrow plank in the faces of the blocks first cast (alternate blocks were first cast and then the spaces between them filled), the object of these being to hold the blocks in line, but reliance as not placed upon them for water tightness. To effect the latter, a key-way was formed consisting of a channel 8 inches square set diamond-wise one foot from the face of the wall, one-half of the diamond in one block and one-half in the other. After the concrete had set, this key-way was filled with clay and sand thoroughly mixed and tempered with water, placed in the opening and rammed with a 20-pound hammer falling upon a steel rod. The clay used was a blue clay obtained from Albany which was believed by the contractor to be better than any to be obtained in the immediate vicinity. It was found not at all difficult to thoroughly compact the clay mixture in this way; in fact, it so nearly approached the condition of a fluid that the face of one block at the joint was forced off from the top almost to the bottom by too severe ramming of the clay. Had the clay filling not been acting as a fluid the effect, it would appear, would have been to break off merely that part of the face nearest to the end of the tamping bar.

In order to learn how tight the wall, and especially these joints, might be, a gallery was run through the body of the wall at the bottom around the entire perimeter of the reservoir. Every few days a measurement is made of the amount of water leaking into this gallery. In February, 1909, the total amount

BLOCK SPLIT BY TAMPING EXPANSION JOINT FILLING

WALL BLOCK, COBB'S HILL RESERVOIR, SHOWING BONDING GROOVE AND KEYWAY

leaking in through the 3,600 linear feet of wall averaged 5½ gallons per minute. By May 1 this had decreased to 1.7 gallons per minute, and by July to 0.8 gallon. By December it had increased to 14.9 gallons owing to the contraction of the concrete, and remained at approximately this figure through the winter, being 14.1 gallons in February, 1910. In March it was 8.5 gallons, and in the latter part of April, 0.8 gallon, running about 0.7 gallon from May to August. By December this had again increased to 15.1 gallons, to 20.5 gallons in January and to 22.5 gallons in February. On April 7, 1911, this had decreased to 12.2, on April 28 it was 5.1 and on May 8 it was 1.3. It is seen that the winter rate of 1910-11 was much higher than that of 1909-10, and that the leakage at the present time is nearly double what it was a year ago. It is believed that this is due to the fact that the clay, owing to the change in cross-section of the key-way due to the contraction and expansion of the concrete, no longer fills this as completely as when it was first placed, and thus allows leakage through it. This was anticipated, and it is expected to again compact the clay in the several key-ways before the leakage becomes serious in amount.

In compacting this, it is proposed to drive into the center of the clay filling a bar carrying on its end a pointed bulb similar in shape to a plumb bob; the object of this being to expand the clay filling and force it into the angles of the key-way. When this has been done the hole which has been formed will be filled with additional clay and sand mixture, tamped with the tamping bar as at first.

In tamping the clay a light portable pile driver was used carrying a 20-pound hammer which was raised by hand. A tamping bar was placed with one end on top of the clay and struck with this hammer, the instructions being to allow this to fall not more than four feet. It is suspected by the engineers that the breaking off of the face above referred to was caused by allowing the hammer to fall considerably further than this.

One practical point in connection with the key-way, or slot, which had probably been learned by experience, was that boys and other idlers about the work would be almost sure to amuse themselves by dropping stones, sticks and other matter into the key-way before it was filled with clay. For this reason a clean-out hole was left leading from the bottom of the key-way to the face of the wall, through which these things could be removed.

Another use for clay in concrete work was mentioned in the description of the Central Avenue bridge described in our issue of May 31. This consisted of placing clay in the end of a recess in a concrete post, in which recess the concrete baluster rail was left free to play in and out by the temperature expansion and contraction of the concrete. This suggests the use of this material for expansion joints between masses or sections of concrete in other portions of exposed structures.

DUST PREVENTION AND CITY STREETS

IN a paper before the New England Conference on Street Cleaning, Prof. A. H. Blanchard stated that there is one way and only one way to satisfactorily prevent dust on bituminous, cement, concrete, brick, wood block and stone block pavements which are subject to excessive horse drawn vehicle traffic; this being to remove the refuse by hand sweeping during the day, mechanical sweeping of the streets at night (which should be preceded by sprinkling) and finally flushing with water to remove fine dust and thoroughly cleanse the surface of the pavement. "Under certain conditions, dependent upon the amount and character of traffic and the uses to which the street is subjected it is feasible to omit the mechanical sweeping. It must be realized that it is absolutely impossible to economically remove fine dust by either hand or mechanical sweeping. The use of the so-called dust palliatives and surface treatments on pavements subjected to heavy mixed traffic is entirely wrong in principle, as sanitary conditions require the constant removal of filth from streets, and if this is removed periodically by flushing, the effectiveness of these processes is

curtailed. Again, periodical watering of pavements to lay dust throughout the day is fundamentally wrong, as the fine dust which necessitates sprinkling should have been removed."

Where these hard surface pavements are used principally by motor car traffic and horse drawn vehicles are infrequent, as on boulevards, flushing is not necessarily a prerequisite of cleanliness. Generally patrol hand sweeping throughout the day will be sufficient. On residential streets with bituminous surfaces, where the traffic is comparatively light, patrol hand sweeping may be sufficient, the nature of the surface being such as to absorb fine dust and render the street practically dustless. In the case of macadam streets in poor condition for superficial treatment or when financial conditions do not render expedient the use of surface treatments and patrol sweeping, recourse must be had to the use of palliatives such as light oils or light tars. To attain successful results it is necessary that light products having the proper chemical and physical properties should be used in small amounts periodically during the season of dust.

In slum residential districts the streets, unless subjected to heavy horse drawn vehicular traffic should, provided grades will permit, be constructed of water bound macadam with a superficial coat of refined tar or as bituminous pavements with a seal coat of refined tar, although the gradient may require the use of an asphaltic-tar compound or asphalt for the seal coat. These forms of construction give a sanitary surface from which the dust can easily be removed by patrol hand sweeping and which will permit thorough cleaning by flushing at night. The nightly flushing with water will perceptibly cool the atmosphere during hot summer nights, which will add materially to the comfort of the residents.

CONTROL AND CLEANING OF STREETS

Entire Control of Street Pavement, Including Sidewalks, under One Authority—Suggested Method of Assessing Cost—Broom Cleaning and Flushing

Slightly condensed from address before Annual Conference of Mayors of New York State by A. Prescott Fowell.

THE entire control of city streets (exclusive of cleaning) should be in charge of some one department or individual, who would have not only supervisory duties but also authority to enforce regulations and ordinances upon other municipal departments as well as upon private corporations. This is becoming more generally appreciated; but few cities have sufficiently developed the idea. There should be some one head which should have complete control of the street from property line to property line, in which should rest the authority to decide when and how a street shall be paved and to regulate all departments and corporations in their tampering with such pavement after it is laid. I do not mean, of course, that this power should be absolute, but that it should be exercised in the enforcement of regulations and laws passed by councils or formulated under their authority.

A partial illustration is the Board of Highway Supervisors of Philadelphia. This is composed of the heads of the Department of Public Works and Bureaus of Highways, Surveys, Water, Electricity and City Property. This board requires the sewer and water departments to certify that their respective conduits have been laid in a street which it is proposed to pave, before it will authorize the beginning of work on the paving; it notifies all public service corporations which have franchise privileges in the street that it is proposed to pave it, and that they will not be permitted to do any excavating therein for 5 years after the pavement is laid—except of course for emergency causes. No cuts can be made in a pavement, new or old, without its permission, and it sees to it that the guarantees of the paving contractors are not rendered void by any such excavations. It also keeps a complete record of all underground structures, and specifies the exact locations for all new ones.

Although altogether too uncommon, such concentration of

control is not unique, in theory at least; but I wish to suggest an extension of this to include the sidewalk also. In most cities the roadway paving is all done by the city, even though the property owner may pay for it; but the sidewalk pavement is laid by the owner, generally of such material as he may select out of a few which are permitted by city ordinances. He is required to conform to the curb grade as given by the city engineer, but the transverse slopes of adjacent sidewalks often vary, and breaks in their surface planes are of more or less common occurrence.

It is generally considered desirable to use the same kind of pavement throughout the roadway of a given street, for a number of blocks, at least; and no one would consider for a moment using brick, asphalt and wood block in alternate stretches of 50 or 100 feet each. But the sidewalk is often a crazy quilt of cement, brick and flagstone, not only alternating but sometimes all jumbled in front of a single property, to the great disfigurement of the street and annoyance if not inconvenience of the pedestrian.

The sidewalk is as much public property as the roadway; it is used by practically all the citizens, while comparatively few ride; and its treatment adds to or detracts from the appearance of the street fully as much as does that of the roadway. In other words, its usefulness and appearance are fully as much matters of public interest and public welfare as are those of the roadway; and the public have just as much right of control over the one as the other. I can therefore see no reason—except precedent—why the treatment of the two should not be the same. Roadway, gutter, curb and sidewalk all are closely related, and should be considered and treated as one. All should be constructed by city authority and be under complete city control.

And this applies to maintenance as well as to construction. A city is responsible for accidents caused by defective sidewalks and can best meet this responsibility by itself maintaining them in safe condition. The plan of the city council notifying a property owner, through the city engineer or a committee, that his sidewalk needs repairing, and then forgetting the matter until attention is again called to it by an indignant citizen or a law suit, is a common one but is not sufficiently effective.

Such construction and maintenance of the sidewalk by the city would certainly be no hardship to the property owner, even though all the cost be charged against him. With all allowance for those conditions which make municipal work cost more than private, I believe that the construction of sidewalks by the city in large contracts let by competitive bidding would result in a lower cost than when let by the owners to small contractors without any real competition as to price; especially when we consider the effect upon value received of the fact that sidewalks laid for a private owner are almost never inspected, while walks contracted for by the city would be laid under more or less effective inspection.

What has been said of the walks applies also to the trees and grassed strips. It is generally agreed by foresters and experts that both the appearance and thriftiness of shade trees are improved by planting a long stretch of street with the same variety and at the same time; and this means by one authority. Being planted, they are a public asset and should not be entrusted to the possible carelessness or ignorance—generally both—of the average citizen. The necessity for municipal supervision of street trees is being recognized more and more generally; and in an increasing number of cities it is becoming the practice not only to spray the shade trees to destroy ravaging insects, but also to trim them as well and give them such attention from the "tree doctor" as they may require.

ASSESSING COST

Streets serve two general purposes: First, to give access, light and air to abutting property; and, second, as thoroughfares for foot and wheel traffic. The first might be called a private use, the second a public one. The first is essential to the use of the property for residential or business purposes;

the second is for the convenience of those who have no rights or interests in the property. In addition the city, when the owner has donated or sold a strip of his land for use as a public highway, grants rights to public service corporations to make other uses of the street, because such uses *are* for the public service.

It is or should be the fundamental theory of assessments to distribute these in proportion to the benefit received. Let us apply this idea to street construction and maintenance.

If a land owner opens up his property but does not dedicate the streets to public use, as in the case of so-called "residence parks," he or the purchasers of the lots therein pay the entire cost of constructing and maintaining the roads in that property, as they should do, since no one else benefits by them. These roads are comparatively inexpensive because of the light use they receive. The owners also use other streets in the city or town, and should bear a part of the expense of *them*.

A resident on a *public* street enjoys a similar benefit from the street in front of his property; but, because it may carry much more and possibly much heavier traffic, the cost of constructing and maintaining the street paving may be considerably greater. The difference in cost between the two is therefore necessitated by the use made of the street by the general public.

If now we endeavor to assess the cost of such a public street in proportion to the benefits conferred by it or use made of it, it would appear that the simplest plan which seems to be approximately equitable is to assess against the property the cost of such a private road as I have referred to, and arrange that the public at large pay the balance of the actual cost. In practice it would probably be better to use as a standard, not a private road, but the last subdivision of residence streets—such standard road as is considered suitable for a residence street used only by the residents thereon and those delivering goods to them or visiting them for social purposes. Width of roadway as well as nature of surface would enter into this consideration. Perhaps the standard for the majority of cities would be a roadway 25 to 30 feet wide paved with a good macadam—possibly a bituminous macadam.

The same idea would apply to the sidewalk also. There is ordinarily little difference in character of surface between sidewalks on different streets, except such as may be occasioned by the use made of it by the owner. The *width* of the walk, however, is increased with increasing public use even more than is that of the roadway.

The element of individual preference on the part of the property owner may be allowed to enter into the determination of the character of street surface where this preference can be humored without sacrificing public interests in any degree. But if this increases the cost this increase should be assessed against the owner.

To illustrate: Suppose a 30-foot roadway of macadam costs \$3 a running foot in a given city, and this be assumed as the standard. The highway department, after considering the traffic and other requirements of a certain street, decides that asphalt pavement is the most suitable for it; the cost of which is \$1.75 a square yard. Also that the roadway should be 40 feet wide. The cost per running foot will then be \$7.78, or \$4.78 more than for a 30-foot macadam street; which sum would be paid by the city at large, the \$3 being assessed against the owners. But suppose these should petition for wood block, which would cost about \$2 a running foot more than would asphalt; then this \$2 also should be assessed against the property owners.

So far no consideration has been given to the business street; and here a new element enters—the additional use made by the abutting owner and the additional benefit derived. It is conceivable that the space required by delivery teams standing at the curb and the number of such teams and of carriages which are attracted to the street by the business houses on a given block would require most of the width allotted to the street, and also a pavement as durable and consequently as expensive as that required for the combined services. It there-

fore seems necessary to establish standard business streets as well as residence ones, distinguishing between that roadway and sidewalk traffic which enters the block in question for business purposes and that which uses it as a thoroughfare only. On the principal retail shopping streets it is probable that a very considerable percentage of both roadway and sidewalk width is required for local traffic—for persons and teams which the abutting owners are only too glad to see on the street, and the presence of which adds to the value of their property. The percentage of cost assessed against the abutters would therefore be high on such streets.

It is not claimed that it is possible to secure perfect equity in all cases by any practicable application of this plan; but it is believed that it makes possible a much nearer approach to this in a greater percentage of cases than is secured by the plan of assessing on the property the whole or some fixed percentage of the cost of paving in every case.

STREET CLEANING

What has been previously been said about including sidewalks with the roadway applies to cleaning them also. An inspection of the dirt on the sidewalks of a paved street will show that it has practically the same source and nature as that on the roadway—in fact, that most of it originated on the roadway and was blown onto the sidewalks; the principal exception being paper. With plenty of neat, unobtrusive trash cans, *systematically located*, and an enforcement of the laws against littering streets, including the throwing of store sweepings into them, practically all street dirt would originate in the roadway. And if it is the admitted duty of the city to remove roadway dirt, then they should clean the sidewalks also.

Even assuming that there is no such duty, and that municipal cleaning is a matter of policy only, a clean sidewalk is fully as desirable as a clean roadway, if not more so. And as sidewalk cleaning by property owners generally consists of merely sweeping the dirt into the gutter to be removed by the city employees; as such sweeping is not so effective as other methods might be, or as sweeping itself would be if the dirt be removed at once from the gutter instead of blowing back onto the sidewalk—for all these reasons I venture to believe that it is as much a matter of duty and policy for the city to clean the sidewalks as for it to clean the streets.

This applies especially to business streets. On residence streets there is less roadway dirt, less frequent cleaning of the roadways, and the sodded strips commonly found there both protect the walk from wind-blown dirt and serve to receive and assimilate sidewalk sweepings.

Modern standards of health and comfort demand the removal of dust and slime as well as of dirt and mud. The machine broom is good for rough cleaning only. A hand broom with a real man behind it—not an object of charity or of political favor—is much better, since it can clean joints between paving blocks and depressions which a machine broom only fills up. But both stir up a dust, unless the street first be sprinkled; and if it be sprinkled they leave a thin smear of mud on the high points with heavier collections of mud in the joints and holes. And this mud is soon dust again.

So far as experience has yet been had, the only method of removing dust is to wash it off. The modern pneumatic cleaners used for sucking up household dust have suggested to many the idea of employing a similar appliance for removing street dust, and I have received scores of inquiries concerning its applicability to this use; but so far I have not learned of a single machine of this kind. Several have been proposed and three or four actually used in which suction is employed to raise into a contained bin the dust brushed off the street by a rotary broom; but this is entirely different from removing dirt from the street surface by suction.

The objections are made to flushing pavements with water, that it wastes the water, is destructive to the pavement and causes deposits in the sewers. The first may be a most valid and serious objection and absolutely bar flushing where water is a scarcity. About half a gallon per square yard per cleaning is required, or approximately 10 per cent of the ordinary

daily consumption in the residences fronting on the length of street cleaned.

As to destruction of pavement, the water jet certainly scours out sand-filled joints and particles of brick or stone which have been chipped off by traffic. On the other hand, the grit thus removed would have served as a grinding medium, assisting traffic to wear out the pavement by attrition; as sand is used in grinding down stone in a stone yard. There is yet no evidence that the best class of pavements are injured by flushing. And if flushing is considered necessary, then it is as proper to adapt pavements to withstand it as to require them to withstand traffic, to be noiseless or possess other desirable characteristics.

As to deposits in sewers, the flushers should wash the dirt to the gutters only, where the heavier matters would be dropped and only the floating matter be carried to the sewer. Although I have inquired I can not learn of any instances of deposits in sewers actually occasioned by street flushing. If it is found that heavier matters are washed into the sewer, it should be a simple matter to devise a temporary dam to be placed at the mouths of street inlets which, while holding back these matters, would permit the water to overflow into the sewer.

Flushing should be used only after brooms have rough-cleaned the pavement. Brooms, on the other hand, should not be expected to remove dust. And scrapers are best for removing matters, like horse droppings, which adhere to smooth pavements. Even the familiar "man with the hoe" has his place on the macadam street. The place of the newer appliances in street cleaning is largely supplementary to the older ones, to give modern perfection to the imperfect work of the latter.

WIDTH OF WHOLESALE STREETS

In a paper before the City Planning Conference Geo. W. Tillson gave some figures to be used in determining the widths of streets used for wholesale business, a class of streets not referred to by other speakers. "As a rule," said he, "a wholesale street is not a thoroughfare, and consequently a width that will fill local requirements is ordinarily sufficient. For the same reason a wholesale street is used but little for pedestrians, so that a wide sidewalk is not necessary. A wide sidewalk is even a detriment, for, as in most cities goods are taken from the buildings across the walks to the trucks, these walks should be no wider than is absolutely necessary." Large trucks in Manhattan backed up to the curb, occupy 13½ feet. As they would seldom be opposite each other, room for one line of moving teams between two trucks, or 36 to 38 feet, would seem to be ample roadway width. Eight to 10 feet should suffice for each sidewalk.

COST OF OILING ROADS

THE accompanying table showing the cost of oiling roads of various widths and using different quantities of oil was published by *Paving and Roads*, a trade organ of the Texas Company. It may be handy for reference, especially as it also gives the number of square yards per mile for roads of various widths between 10 and 48 feet.

COST OF OILING ROADS OF DIFFERENT WIDTHS AND WITH VARYING QUANTITIES OF MATERIAL.

Width of Rd. Feet	Sq. Yds.	COST PER MILE AT 4½¢. PER GALLON.				
		¼ Gal.	¼ Gal.	½ Gal.	¾ Gal.	1 Gal.
10	5866	\$65.97	\$87.97	\$131.98	\$197.95	\$263.96
12	7040	79.20	105.62	158.40	237.60	316.80
14	8212	92.38	123.16	184.77	277.15	369.54
16	9384	105.57	140.17	211.14	316.71	422.28
18	10560	118.80	158.40	237.60	356.40	475.20
20	11732	132.00	175.50	263.97	395.97	527.94
22	12904	145.17	193.55	290.34	435.51	580.68
24	14080	158.40	211.19	316.80	475.20	633.60
26	15252	171.58	228.68	343.17	514.75	686.34
28	16424	184.80	246.34	369.54	554.34	739.08
30	17600	198.00	263.98	396.00	594.00	792.00

Retempering Concrete

As concrete enters now into almost every class of structure, from the sewer underground and the pavement on it to the buildings above the ground, any idea which is novel and valuable concerning the use of concrete is perhaps of more general interest than almost any other class of information. The experiments described generally in an article in this issue are, it is realized by the experimenter, far from exhaustive, and it is hoped that the publicity given to the matter will lead to experiments in laboratories and tests in actual practice by others which will demonstrate either the truth or the fallacy of the conclusions derived from the Rochester experiments. As stated in the article, the decision to use retempered concrete in Rochester is based fully as much on practical experience as upon laboratory tests.

As we go to press we receive a letter from Ernest McCullough, of Chicago, which informs us that the idea is not entirely novel—in fact, that he had written for a technical paper about five years ago an article recommending the use of retempered concrete for patching old concrete and for joining fresh concrete to that which had fully set. The idea, he

stated, he obtained from an old English mason who regarded it somewhat in the nature of a trade secret and was remarkably successful in the use of retempered concrete for the purposes just named. In patching sidewalk surfaces this mason would clean the surface thoroughly with a wire brush and soak it with diluted acid to obtain a clean and porous surface. Mortar which had been allowed to stand for one-half to three-fourths of an hour was retempered, being worked over most thoroughly and energetically, with the occasional addition of water, and was then placed upon this surface, trowelling it in place much harder than is the ordinary practice. Mr. McCullough states that he has used this idea in his own work, and also has experimented with the use of fresh and retempered cement and lime, alone or in combination, for bonding new work to old, and as mortar between cement blocks. For both purposes he found retempered mortar containing from 10 to 15 per cent of lime to be the strongest of any of these and to be free from discoloration due to the lime. He also found that retempered mortar made from briquettes was stronger than briquettes made into fresh mortar. Mr. McCullough's book, "Engineering Work in Towns and Cities" contains a description and discussion of retempered mortar.

We are glad to have corroboration of the value of retempered concrete brought to our notice at this time, so that we can publish it in connection with the description of the Rochester work. While it would appear from the above that the idea is not new, we still feel that it is so little known or appreciated by engineers generally that we are justified in giving it the space which we have in the last two issues. In some cases the absence of joints of weak bond between old and fresh concrete is so essential that considerable expense is incurred in carrying on the work continuously until the completion of the desired monolith. If retempered concrete serves to make a perfect bond between the two it would seem possible to avoid the greater part of the expense, and frequently the annoyance and interruption with other work, occasioned by the continuous placing of the concrete. Its use for patching concrete sidewalks, curbs, etc., is of the greatest importance to municipal engineers and contractors.

City Plans Commission for Salem

Salem, Mass., has created a Board of City Plan Commissioners of five, none to be an officer or employee of the city, to serve without compensation; one member to go out of office each year, his successor to be appointed by the mayor. In addition to these, the mayor, president of the Board of Aldermen and president of the Common Council are ex-officio members. This board is to employ the necessary experts and report a city plan to meet present and future needs of the city; giving special consideration to elimination of grade crossings, grade and alignment of existing streets and extensions, parks and parkways, preserving historical landmarks, improvement of the water front, and the general industrial and commercial development of the city.

Street Cleaning Accounting

SPEAKING before the New England Conference on Street Cleaning Dr. Ernest Meyer, of the United States Census Bureau, made a strong plea for the adoption of cost accounting methods in street cleaning departments, and preferably the adoption of uniform methods by all cities. As between cash accounting and cost accounting the latter is far superior for practical purposes, as cash accounting does not offer any gauge of efficiency. Boston, he said, is the only city which has made a detailed study of the cost of street cleaning, this cost being shown separately by districts.

In formulating a method of accounting we are confronted at the outset with the problem of what accounts should be kept and what physical data collected. There can be no question that the records should include the kind of paving cleaned, the condition of the pavement, the intensity and volume of traffic, the amount of litter found on the streets, the stringency of

police regulations, the kind of machines and methods employed, wages paid, organization of the force, and length of haul of dirt removed.

Should the cities of New England, or any considerable number of cities in the country, agree upon some uniform method of keeping their accounts and records relative to street cleaning, the Census Department could, he stated, tabulate and publish the results within a month or two of the end of the year and thus give out by far the most comprehensive and accurate study on street cleaning ever attempted. The idea of conservation which, in private enterprises, finds its expression in the application of scientific principles of business management, must and will invade public enterprises and functions and bring about an enormous increase in economy and efficiency in these.

SOUNDING BAR FOR LOCATING ROCK

In a paper before the journal of the American Society of Engineering Contractors, calling attention to the importance of investigating geological conditions preliminary to planning contract work, the author, John W. King, described a simple device which has proved serviceable not only to contractors but also to engineers; one use being to locate the depth of rock along a line of proposed sewer or water main. The device is described by Mr. King as follows:

The instrument referred to is a bar of hexagon or octagon steel, the end of which is swedged and enlarged at the butt and tapered to a point at the end; the sides of the head being corrugated with a cutting edge. On the opposite end the bar has a T handle riveted firmly to the shank, and this shank or rod may be 20 to 25 ft. long—often more. The method of operating is to raise this rod to a vertical position with the sharp bit on the ground, and then, by churning the rod, drive same into the earth until the bit reaches a resistance. If continued churning does not remove or penetrate the obstacle in its path, several hard churns will dislodge particles from the obstruction, and by twisting the handle around several times the particles will lodge within the cutting edge of the bit, and may be brought to the surface where they may be examined and their substance determined.

In open-cut mining work, where the writer first employed this method, it was customary to lay off our tract of land to be examined in squares of 10 ft., so that each square contained 100 sq. ft., staking the corners, and at each stake we sounded with the above method and charted the results, and in this way determined the extent of our beds, with the amount of overburden necessary to be removed. We always found this method very satisfactory.

As to the cost of making these soundings, we found that two men were sufficient, and they were capable of sounding from ten to fifteen holes per hour.

HIGH BUILDINGS AND CITY ARCHITECTURE

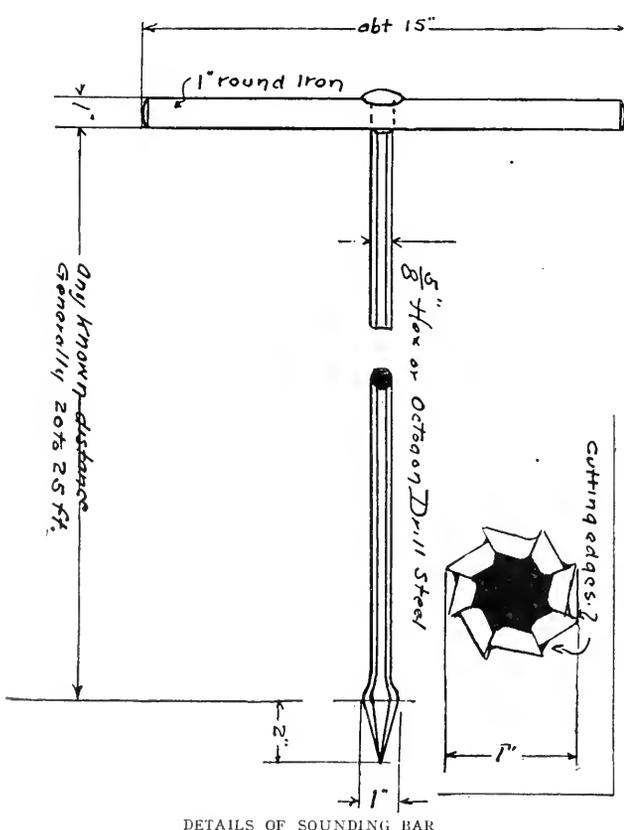

In a paper before the Conference on City Planning, Mr. Ernest Flagg discussed, among other things, the effect which modern systems of construction have and should have upon the architecture of buildings. He concluded that very high building had come to stay and that it would be impossible to enforce legislation prohibiting them. Taking these for granted, he found the ordinary style of architecture usually adopted for city halls and other public buildings to be incongruous unless these buildings could be located in large grounds with no skyscrapers for a background.

"Should our public buildings then be low and massive of a different type and of a different kind of architecture from the surrounding structures, or should they out-Herod Herod, and dominate them in height and extravagance of design? I think there is little doubt but that the latter course will be preferred." This would require the development of a new style of architecture—one which has not found its expression in any public buildings yet constructed. Mr. Flagg believes that height in itself is not inconsistent with dignity, and that the time will come when public buildings in the United States "will be carried to such amazing heights that the tallest commercial building will be dwarfed by them. I have no doubt that heights approximating 2000 feet will be reached within the next 25 years, for I see no reason why such heights should not be practical."

Concerning the location of public buildings, he advocates substituting them for tenements in the slum districts, arguing that in this way sufficient land could be obtained for a civic center or even for a single public building at much less cost than if it were located in the heart of the business district; that such a location would enhance property values and the increased taxes would assist greatly in paying for the improvement; and that it would involve the added benefit of cleaning out objectionable conditions. "Under favorable conditions a whole new civic center could be created at no greater cost than would be involved by the erection of a single building in the old locality."

Concerning the effect of tall buildings in cutting off the light and air from streets and adjacent buildings, he said: "The time will come when something must be done to counteract this evil, and if the remedy takes the form of a limitation of the area which can be occupied above a certain limit of height, as I think it will, great good, both practical and artistic, may come of it. It is useless to expect that we in this country will limit the height of buildings at a point sufficiently low to be effective for securing light for streets and buildings. Such a limit would require that their height should not exceed the width of the narrow streets or be more than $\frac{1}{2}$ times as high as the width of wide streets, and a similar limit would even be agreed to here. It may be that a similar limit will be tried, but if so it will be found ineffective and some other expedient will have to be resorted to.

"Now my doctrine is that above a certain limit, say at a height equal to the width of the street, only a small part of the area of every lot should be built over to a further height and that the high part of every building should be set somewhat back from the street. If a plan of this kind were adopted there would be space for light and air to play around the upper parts of the structures and to find its way to the streets."

DETAILS OF SOUNDING BAR

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

New Boulevard Will Be Ready by Winter

Oklahoma City, Okla.—The park commissioners are preparing to finish the new Grand Boulevard, which will circle about the city and be nearly twenty-eight miles in length. At present two-thirds of the thoroughfare is completed, and the rest in litigation. The board is to meet with the State School Land Commission and arrange for the purchase of certain school sections and also to decide upon securing other ground. If the owners refuse to make terms the board plans to bring suit to condemn the land and have the courts appraise its value. The northeast and east portions of the boulevard are in fine condition and the board hopes to have the southwest and west parts completed before winter.

Must Clear Roadway of Trees

Spokane, Wash.—In its policy of preserving the natural scenery in Rockwood addition, even to the extent of allowing huge trees to grow in the roadways and sidewalks, the Spokane-Washington Improvement Company has run athwart the cold-blooded calculation of the city commissioners. Foreseeing damage suits against the city for accidents the commissioners will order the cutting down of many a monarch of the forest in this new exclusive residence district of the South Side. The city commissioners made a trip of inspection over the addition. While the natural beauty of the scene, resulting from the preservation of the big trees, did not escape them, the consensus of opinion among the city fathers was that the roadways and sidewalks should be kept open.

Plan to Make Grand Rapids a City of Parkways

Grand Rapids, Mich.—When the Common Council and Board of Estimates placed \$2,600 in the budget for the protection and care of street trees, the city government took another step toward placing Grand Rapids in an advanced position and on an equal footing with other progressive cities. An ordinance to regulate the planting, preservation and care of trees growing on the streets and boulevards of Grand Rapids was passed by the Common Council April 7, 1910, and first put in force May 16, 1911. It is the duty of the Board of Park and Cemetery Commissioners to enforce this ordinance and this board will receive the hearty cooperation of every citizen that Grand Rapids may always be known as the beautiful city of homes and shade trees. It is not expected that all evils that years of neglect have brought about can be cured at once. This would be impossible, but it is timely to make an intelligent start in order to prevent mistakes in the future.

Improvements Under Way to Cost Large Amount

Rochester, N. Y.—Figures as to the improvements now under way in Rochester, prepared by Assistant Chief Clerk Marks, of the City Engineer's Department, give an idea of the immense amount of public works undertaken by the city last year. Mr. Marks in his statement said: "The city is now completing the work on improvements and sewers that were begun in 1910, to the amount of \$336,500; also a concrete bridge over the Genesee River at Central Avenue, at an estimated cost of \$160,000; and also a concrete bridge over Bed Creek at the Westfall Road, Genesee Valley Park, at an estimated cost of \$15,000. The N. Y. C. & H. R. R. also began the erection of a new station north of Central avenue, between Clinton avenue North and Joseph avenue, with the widening of three bridges over several streets and the changing of the grade and improving streets, at an estimated cost of \$1,500,000. The work begun this year, including contracts let, amounts to the sum of \$1,000,000. Also contracts have been let and work is under way from the sewage disposal contracts already let for \$303,184.50. The estimated cost of the entire new sewage system is \$1,500,000."

SEWERAGE AND SANITATION

Sewers Faulty; Property Owner Collects Damages

Syracuse, N. Y.—Damage done the property of Joseph Oot in Manlius Street when the drainage system of East Syracuse became disabled, was assessed at \$1,545 by Justice William S. Andrews in his decision in the action brought against the village. The cellar of the house was flooded a number of times between 1896 and 1908, and damages were awarded for the loss in rents and the general depreciation of the property due to the condition of the sewers in that time. The judgment also orders the village of East Syracuse to remedy the condition of the sewers at that point to prevent a recurrence of the floods.

Children Help Board of Health Clean City

Indianapolis, Ind.—An effort made by the City Board of Health to enlist school children in making the city more sanitary and more beautiful is getting results. Reports are being received by the board to the effect that school children in all parts of the city are cleaning alleys and back yards, whitewashing fences and otherwise giving material aid in cleaning up Indianapolis. Some time ago Dr. Charles S. Wods, secretary of the board, sent out-lines of a course of municipal civics to school teachers, suggesting that the school children investigate the collection of ashes and garbage, among other things, and where conditions were not right report matters to the health board. As a result the inspectors of the health board are unable to keep pace with the complaints made by the children. At school No. 9, Vermont nad Fulton streets, the school district has been divided into areas, and children are assigned to look after sanitary conditions in their respective areas. At least two hundred complaints have been made by children from that school, calling attention to ash piles in alleys and back yards, and to uncovered garbage cans, as well as to general conditions tending to make the city unsanitary or unsightly.

Sewer Collapses.

Portland, Ore.—Tanner Creek sewer, from Morrison street to the river, a distance of three-fourths of a mile, is in a state of collapse. This condition was discovered when two sewer inspectors traversed the entire length of the conduit and found the drain to be in a dilapidated condition. Nearly one-half of the entire length of the drain is minus a bottom, the stone blocks having been washed out and the sewage was found running on the earth. Much of the top of the sewer was bowed down and was found in a highly dangerous condition. In several places bricks were loose and easily fell from their places. Another more careful inspection will be made to determine the extent of the repairs necessary, but it is believed from the reports brought in that the entire conduit, from Morrison street to the river, will have to be reconstructed. This will cost approximately \$50,000, and the cost will have to be paid by the owners of property affected.

Clean-up of Hotels Ordered.

Fort Scott, Kan.—The State Board of Health of Kansas has instituted another very badly needed and commendable reform in the way of public sanitation and cleanliness. An order has been issued to the several drug and food inspectors to get busy with a detailed and careful inspection of all hotels and restaurants in the state. Assistance from the local county health officers and fire marshal of the several counties is imperative, and the several health officers and fire marshals will be required to attend and be present at all the inspections. All places found to be dirty or unsanitary, will be notified to clean-up at once and continue their operations in sanitary manner. If violations of the orders ensue, the county attorneys of the several counties are to begin prosecution and compel enforcement of the law.

Health Board for Better Inspection at Abattoirs

Sacramento, Cal.—The proposition of having a central abattoir erected on the outskirts of the city, where all meat that is shipped outside the city can be inspected, as well as that used in Sacramento, has been submitted to the City Board of Health by Dr. J. W. James. The idea was to have the abattoir supported by the butchers of the city and have an official inspector present at all times to inspect all meats. It was argued that, under the present plan, one inspector could not keep in close touch with the four or five slaughter houses, whereas if there was a central place his work would be thorough. In this connection Dr. F. G. Fay stated that Oakland was stealing the credit on Sacramento meats by placing an Oakland stamp on the product shipped from this city to the Bay. Drs. James and Fay were appointed a committee to take up this work.

Circuit Court Says Sewage Disposal Plant Law Is Invalid

Columbus, O.—The Darke County Circuit Court holds the Bense act, giving the State Board of Health authority to compel municipalities to install filtration and sewage disposal plants to be unconstitutional because it exempts some Ohio River cities. The State will carry up the case.

Law Requiring Screening of Food Will Be Enforced

Richmond, Va.—Clerks of the two markets report to the Council Committee on Markets that hucksters had been informed that the Board of Health would require hereafter a strict enforcement of the Mills ordinance, requiring screening of all food exposed for sale, and also of a health regulation forbidding the storing of live fowls in market stalls after market hours. The committee directed the clerks to give the sanitary officers every possible assistance in enforcing both measures.

Pure Water is Killing Typhoid.

Toledo, Ohio.—Typhoid fever cases in Toledo have decreased nearly 200 per cent in two years, according to the report for the first four months of the year compiled Monday by Health Officer Becker. During January, February, March and April of 1911, there were 55 cases of typhoid, and but 10 deaths. This is compared to 73 cases and 17 deaths in 1910, and 142 cases and 23 deaths from typhoid during the first four months of 1909. Health Officer Becker attributes part of this improvement to the purification of the water supply, and another cause for the decrease is the number of houses compelled to provide for sanitary disposal of sewage.

Deep Wells to Prevent Typhoid Fever Epidemic.

Hutchinson, Kan.—To safeguard the city against typhoid epidemics and other diseases, the city plumbing board presented an ordinance to the city commission which will prohibit the sinking of wells less than thirty feet deep in the city. The board will require that wells should be driven to the second strata of water. A good many shallow wells are in use over the city, only a few feet deep, and tapping a surface water which is impure. Thirty feet is not far to drive a well, and a good pure supply of water can be had at that depth.

Bacteriologist Reports City Water Safe.

Binghamton, N. Y.—Although the Susquehanna river water, from which the city's drinking supply is drawn is bad, containing sewage bacteria and vegetable growth, the drinking water is pure as a result of filtration, according to the report of the city bacteriologist. From a sample of river water taken May 22 it was ascertained that there was 98.92 per cent of sewage bacteria in the raw water, but that it was absent from the filtered product. During recent hot and humid weather algae has grown abundantly in the river water, causing a pronounced swampy odor and taste and has fouled the filters repeatedly. This condition, the bacteriologist says, will probably continue until the weather changes markedly.

Score System As Check on Restaurants

Spokane, Wash.—Health Officer J. B. Anderson has completed details of his new restaurant inspection system, authorized by the city council as a result of the uncleanly conditions found recently in many eating houses. On the new inspection system a "perfect" restaurant scores 100 points, and any place scoring 40 points or less must be closed until the sanitary conditions are improved.

WATER SUPPLY

Ottawa Complains of Water.

Ottawa, Ontario.—Hypochloride of lime, which the city of Ottawa is using in its water supply, following a typhoid fever epidemic, is causing bitter complaint. The lime has killed all the gold fish in private aquariums, is eating away the rubber washers in taps, and now it is feared that it is going to kill the grass lawns where sprinklers are used. The complaints do not disclose its effect on humans, who use the Ottawa water.

U. S. Furnishes City Water

Carlsbad, N. M.—The town will receive its water supply from the irrigation system of the Carlsbad project. A contract for five years, which has been approved by the Secretary of the Interior, provides that the town is to pay the government at the rate of \$1.25 per acre foot, which is the price at which water was rented to agricultural lands within the project. This represents a net annual income of eight per cent on the construction charge investment.

Jersey Water Company Adds to Reservoir Capacity

Oradell, N. J.—The Hackensack Water Company is building a dam at Oradell which it is said will increase its reservoir capacity to about 150 million gallons, and it is hoped will save them the necessity of buying water from Jersey City to supply the towns Bergen and Hudson counties where it has franchises. The illustration shows the temporary earth dam built to hold back the water during the

Courtesy Jersey Journal

TEMPORARY DAM AT ORADELL

construction of the concrete dam 200 feet long about 75 feet below. The depth of the new reservoir will average only about three feet deep, and will be half a mile long. It will hold over 10,000,000 gallons. Commissioner George J. Brackner, of the Jersey City Street and Water Board, is quoted as saying that in view of the rapid growth in population in Bergen County the new reservoir would not afford much relief.

Plans to Increase Water Supply by Raising Dam

Baltimore, Md.—Having in mind a possible abandonment of the more expensive and elaborate plan proposed by the consulting engineers of the Water Department, Mayor James H. Preston has announced that he was considering a suggestion for the improvement of the city's water supply which, instead of requiring the erection of a new dam on the Gunpowder River, would simply provide that the present dam be raised. In further explanation of the reasons prompting this suggestion, the Mayor took the position that in ten or fifteen years it is possible that the city will have outgrown the Gunpowder supply, inasmuch as it is the tendency for streams all over the country to diminish in stream flow, and that Baltimore in that event would have to turn to a larger source of supply, such, for example, as the Susquehanna River. Should that prove to be the case, he said, the money spent in carrying out the plan of the consulting engineers would have been wasted. During the same period, he declared, he thought it possible, by raising the present dam at Loch Raven, to provide for the needs of the city.

City Asks Water Company for Offer

Oakland, Cal.—Frank C. Havens, president of the People's Water Company, and the board of directors of that corporation will submit an offer for the sale of that part of the concern's system known as the "Oakland division" to the Oakland City Council, as soon as the corps of engineers now employed can get together all the necessary data. It is known that the city, through an indirect source, has asked the water company to make an offer on its Oakland division. This offer will be submitted to the City Council within a very few weeks, after which negotiations for the purchase of the system for a municipal water supply will begin. Officers of the corporation refused to discuss the probable sum to be asked of the city, but it is estimated that it will exceed \$10,000,000.

First City Well Great Success

Moorhead, N. Dak.—The sinking of a well, which is a 12-inch bore, without casing, was an experiment and is the first of four which will be used to give Moorhead an adequate supply of the purest water. Superintendent Warner, of the city water plant, states that the present well will be capable of giving 100,000 gallons of water daily to consumers. The water in the pipe comes within six feet of the top of the well, and while maintaining the 100,000 gallon test the water was lowered to the thirty-foot level. Within five minutes after the pumps stop the water is back at the six-foot level. It is the purpose of the city commission to sink at once three more wells of 10-inch bore, and to connect all with a large reservoir. The well is 187 feet deep. Moorhead uses an average of 350,000 gallons of water a day, and with the large reservoir all emergencies will be cared for.

Would Charge for Water Now Furnished Free

Spokane, Wash.—Commissioner C. M. Fassett is considering a revolutionary recommendation in regard to water rates. The city water department annually gives away over 1,506,300,000 gallons of water, and receives only a small return (amounting sometimes to less than the cost of pumping), from 22,800,000 gallons more. To make a charge for the greater part of this free water and to raise the rate paid on the other amount, which is now pumped practically free, is the proposition being studied by the commissioner. In this regard Commissioner Fassett is considering the policy of making the general fund, or the taxpayers at large, stand for the water used to fight fires, flush sewers, sprinkling streets and now given away to the schools, Fort Wright, city buildings and charitable institutions. The burden of supplying this free water now falls on the water consumers alone. The free water list and the estimated amount used annually, which it has been urged should be paid out of the general fund, is as follows:

For fighting fires, 600,000,000 gallons; flushing sewers, 750,000,000 gallons; public schools, 12,000,000 gallons; street sprinkling, 8,000,000 gallons; Fort Wright, 37,500,000 gallons; cleaning sidewalks, 2,000,000 gallons; water troughs, 2,000,000 gallons; city buildings, 3,800,000 gallons; charitable institutions, 3,000,000 gallons.

City Making Tests of Water Pipes

Akron, Ohio.—Under the direction of Service Director J. W. Gauthier extensive tests are being made of the condition of the water pipe of the Akron Water Company in various parts of town. Holes are dug at various points and the pipe examined at first hand. A complete record of the result of the tests is being kept and this will be used when the city again approaches a decision as to whether or not to buy the Akron Water Company's plant as the basis of a municipal water plant. The city has records showing just how long all the different sections of pipe have been in the ground. For instance, all the pipe laid fifteen years ago is tested, and careful comparisons made. Then all the pipe laid ten years and eight years or whatever the time may be is given similar tests. Server Gauthier reports that some of the oldest pipe is found to be in excellent condition and that other pipe laid a shorter time is sometimes found so thin that a knife blade can be stuck through it. Much of the trouble encountered is attributed to electrolysis and is found in the vicinity of the electric power lines.

New Street Light Being Tried

Council Bluffs, Ia.—A new light has been hung at the intersection of Pearl Street and Broadway by Manager A. L. English of the Citizens' Gas and Electric Company. Mr. English is a strong advocate of the new light, which is a high candle power flaming arc lamp. Its brilliance exceeds anything else known in street lights. Despite the 5,000 candle power, the globe is arranged to make the illuminating element mellow and not at all hard on the vision. Should such style lights be placed at intervals along Broadway that street would be more efficiently illuminated than any other street in this part of the United States. Such lights as the one on exhibition are being used in Boston and in other large cities and are proving extremely desirable. The light will be left in indefinitely,

City Has Demonstration of New Lighting System

Wilmington, Del.—Market street as it should be lighted was demonstrated last week by the lighting department of the Wilmington and Philadelphia Traction Company on Market street between Ninth and Tenth. With arcs and incandescents, the company showed that it could light the street with a bright but pleasant light and leave no dark or shady spots in the thoroughfare. Members of City Council, the Board of Trade and the directors of the Street and Sewer Department were interested observers at the demonstration. A large crowd was attracted by the novelty of the illumination. The incandescent lights were strung in arrangements of two each at intervals. The arc lights on the corner were turned off and the new system, which was erected temporarily by the use of wires, demonstrated that it is far superior to the "arc at each corner" plan. The lights demonstrated are of eighty-candle power each, being the new Tungsten lamps, which give a very true white, cheerful light. Lamps of the larger size each giving 120-candle power were shown first, but the smaller ones were more satisfactory.

Company Gets Twenty-five Year Franchise

Chisholm, Minn.—A new franchise has been granted the Range Power company by the village, to continue for twenty-five years; the village, however, retaining the right to revoke the franchise, and purchase the plant at its option, at the expiration of the first three years, and at every five-year period thereafter, during the existence of the franchise. The company agrees to put in an auxiliary plant to provide against any possible break-down of the plant now running. It is to furnish a day current within ninety days and reduce the rates on both the street arc lights and the lights used by the ordinary consumer.

Elsmere Gives Right to Gas Co.

Elsmere, Del.—Residents of Elsmere are so pleased to have the service of the Wilmington Gas Company extended to that suburb that they have given the company the right to use the streets and many houses have ordered gas installed.

New Light Plant.

Crowley, La.—The new switch-boards for the city electric light plant have arrived and it is expected that the new electric lighting installation will be completed within two weeks. Since the destruction of the power house by fire in November, 1909, a temporary electric plant has furnished an inadequate electric light supply.

Lighting Scheme Opposed.

Washington, D. C.—The plan for a double row of lights in the center of Pennsylvania avenue from the Capitol to the Treasury has been abandoned by the District Commissioners following unfavorable report by the Fine Arts Commission. The scheme for lighting the avenue was recently recommended by W. C. Allen, electrical engineer. It is contended in the report that although the method has been tried in other cities with some success, it is not thought feasible for Washington, as it is thought it would destroy the beauty of the avenue. The commissioners referred the Fine Arts Commission's report to Engineer Allen with the request that he devise another plan.

FIRE AND POLICE

Atlantic Highlands Fire Company Proud of Auto Engine

Atlantic Highlands, N. J.—The new combination chemical automobile engine has arrived for the Navisink Hose Company from New York. The trip was made from the city to this place by road.

Committees See Demonstration

Mishawaka, Mich.—Committees representing the city governments of Fort Wayne, South Bend, Michigan City, Hammond, Ind., and Monroe, Mich., were in the city to witness the official test of the motor car truck for Mishawaka's central fire station. They came because a special car had been made for this city following special specifications given by Fire Chief Albert Buyssee, which included a 40-gallon chemical tank under the seat instead of in sight. There are some other special features which add to the beauty and usefulness of the truck. It is the first of the kind ever built. All the committees were well pleased with the car which sells for \$5,500.

An Alarm System at Last

Syracuse, N. Y.—The Gamewell Company has bidden sufficiently low on specifications for a fire alarm system. It was to this company that it was proposed to award the contract two years ago under specifications which the court disapproved. The agitation which some good people felt lest the city should instal a system not of proved reliability now evaporates. The administration gets the alarm apparatus it wanted at a price lower than it had hoped. The way is now open for the prompt installation of this necessary feature of an efficient system of fire protection.

GOVERNMENT AND FINANCE

Exhibit of City Methods Planned

Kalamazoo, Mich.—If the plans of Mayor Charles Farrell are carried out, Kalamazoo will be the first city in the middle west to have a municipal exhibit. It is his idea to bring together different department officials of cities from all over the country and let them compare and display their ways of running the business of the cities represented.

Expert Reports on City's Books

Tacoma, Wash.—Declaring many of the municipal records "crude," Herbert E. Post, certified public accountant, who has spent more than five months auditing the records of Tacoma, has filed a complete report, covering the entire period of nine months in which the city has operated under the commission form of government. He says all the money received by the city treasurer has been properly accounted for, but that the office stubs show many receipts which could not be verified on account of the system formerly followed. Mr. Post was employed by the mayor and municipal commission the first of the year to make the nine months' check required by section 52 of the new charter, which says the city books shall be audited at the beginning of each year. Although the bookkeeping methods are not approved by the expert, only a few errors are noted in the report, which covers each department thoroughly and gives a list of 19 schedules and statements of the operations of funds during the nine months' period. During that time the city's volume of business was noted in the receipts, disbursements and balances on hand as follows: Balance, March 31, 1910, \$1,137,582.27; receipts, \$2,882,578.83; total, \$4,020,161.10. Disbursements were \$2,912,555.10, leaving a balance on December 31, 1910, of \$1,107,606. Much of this balance, however, has been wiped out in the five months of this year.

Tax Rate Drops From \$15 to \$3

Orleans, Mass.—John Kenrick, chairman of the Board of Assessors, has officially announced that the 1911 tax rate is \$3 on \$1,000. The drop from \$15 is the result of Sidney W. Winslow, the president of the United States Machinery Co., taking up his residence in South Orleans, increasing the town's valuation from \$700,000 to \$1,500,000.

STREET CLEANING AND REFUSE DISPOSAL

To Clean Streets Nights

New Britain, Conn.—President Moore of the board of public works has arranged to carry out the recommendation in Mayor Halloran's message to have the streets cleaned at night. The squeegee machine will be used. It can be used to better advantage when the traffic is lighter.

Curb Garbage Collection

Toledo, O.—Service Director Cowell started a crusade Thursday which will result in the arrest of all persons collecting garbage in the city without proper authority. Members of the police department received orders to make arrests. "The city has been blamed repeatedly because garbage is hauled through the streets in all kinds of receptacles exposed in such a way as to be offensive, and this simply must stop," said Director Cowell. "The department has taken special pains and incurred additional expense to provide for the proper collection and disposal of garbage and people do not generally know that some of it is being carried away by individuals other than those employed by the city." City ordinances provide that all garbage collections should be taken care of through the board of public service and that no individuals, partnerships, or corporations can do so without permission from the department. The penalty for violation is a fine of from \$5 to \$50.

City Will Collect No More Rubbish

Columbus, O.—The rubbish department of the city of Columbus is clogged up, and no more cogs will turn in the wheels of the campaign of cleanliness for several days. The work is rather contrary to what was expected, because some people have been storing rubbish in their cellars and back rooms for years, awaiting just such a chance as was made possible when council appropriated money to begin the work of cleaning the city. The order of the mayor to have rubbish placed in the back yards is rescinded, and if the good housewife wants it removed, the best and surest way is to hire a man to haul it away. Otherwise it may remain all summer. The municipal rubbish department has about all it can do to keep up in the board of health's campaign to rid Columbus of flies.

Mayor Will Visit Cities Investigating Garbage Question

Indianapolis, Ind.—An investigation of garbage contracts and means of collecting and disposing of garbage in several cities will be made by Mayor Shank. The mayor will go with the board of park commissioners and board of public works to Chicago June 7 to investigate the park and boulevard systems, and from there will begin an extensive trip to investigate the garbage question. The mayor expects to visit Cleveland, Buffalo, Rochester, New York, Philadelphia, Washington and Columbus, O. He will be accompanied by Superintendent of Police Hyland, who will attend the annual convention of the National Association of Police Chiefs, to be held in Rochester. The mayor expects to return to the city June 17. On the garbage investigation trip the mayor will pay his own expenses, and the members of the park board will pay their own expenses on the trip to Chicago.

Clean-Up Week Holds Over Three Days

Knoxville, Tenn.—Chairman John W. Flenniken, has found it necessary to keep the clean-up crew busy for a few days as it did not get all of the refuse hauled away during clean-up week. The total number of wagon loads of garbage hauled during the six days was 947. This is one of the largest week's work ever done by the department. Chairman Flenniken states that it will take at least three more days to complete the work.

Has Surplus of Chloride

Duluth, Minn.—The Board of Public Works is somewhat "up against it" for a place to store the calcium chloride which has been consigned to it in this city. It was estimated that 400 tons would be needed for the first application in the districts which will not be sprinkled with water. About half the territory has been covered and approximately sixty tons have been used. The other half will likely take about the same amount, which will leave the board with 280 tons of the dust-laying preparation on its hands.

RAPID TRANSIT

Rushing Work on Extension of Trolley

Syracuse, N. Y.—Just when Syracuse people will be able to charge for transfers has become an actuality. At a meeting of the directors in the office of President Stanley of the Cleveland Railway Company recently it was decided that Commissioner Dahl's order calling for the abolishment of the transfer charge should be observed. The directors gave notice that, in view of the elimination of the transfer charge, they will in the near future ask the Council for an increase in the maintenance and renewal reserve funds.

Cleveland Now Has Three-Cent Trolley Fare

Cleveland, O.—Straight three-cent fare without any charge for transfers has become an actuality. At a meeting of the directors in the office of President Stanley of the Cleveland Railway Company recently it was decided that Commissioner Dahl's order calling for the abolishment of the transfer charge should be observed. The directors gave notice that, in view of the elimination of the transfer charge, they will in the near future ask the Council for an increase in the maintenance and renewal reserve funds.

Trolleys to be Built Under 20-Year Franchise

Jersey City, N. J.—After having declared for years that it would never invest money on trolley extensions or new lines as long as the twenty-year limited franchise act is in force, the Public Service Corporation has now receded from that position. The belief in some quarters is that the trolley company, fearing that the Board of Public Utility Commissioners under the new Egan utilities act might exercise its right to order extensions off hand not exactly to the liking of the trolley company, has decided to treat with the local municipal bodies as the lesser evil and accept ordinances under the limited franchise act.

Experts Point Out Defects in Rapid Transit System

Philadelphia, Pa.—A comprehensive plan of rerouting the lines of the Philadelphia Rapid Transit Company for the purpose of bringing every section into easy communication with the main centers of travel, and of relieving the pressure of traffic at particular points and at particular hours, proves to be the principal topic of discussion in the elaborate report upon the property and the service of the company made to the State Railroad Commission by Ford, Bacon & Davis, engineers, of New York. This report is issued in two paper-bound volumes, of about 150 pages each. The experts' plan, which is explained with 35 maps and diagrams, contained in Volume II, is an attempt, says the report, to help solve the problem of "providing rapid, direct lines between points of travel, arranged to furnish facilities for the entire city, systematically, uniformly, consistently and impractically." The present Philadelphia routes, say the experts, are far from conforming to this ideal, owing to the fact that the city plan is not conducive to good transportation facilities; that subsequent additions to the city have been made without due attention to intercommunication; that the original systems were built as competitive lines, and that the management of the consolidated lines has made little effort to correct the defects.

Suburban Trolley Contract Let

Charlotte, N. C.—The Charlotte Rapid Transit Company, a suburban railway, has let the contract for the construction of its line. The contract embraces grading, subways, bridges and track laying, and calls for the operation of the system by August 15. The amount named was not given out. The line will begin at a terminus of the city system and open up distant suburbs for development, and the Beach storage battery cars will be used, doing away with the trolley.

Street Poles Go

Spokane, Wash.—Street car poles on the main streets of Spokane are to be done away with, according to the superintendent of railways of the Washington Water Power company. The company is carrying out this work at the request of the city commissioners, and wherever buildings are of modern construction the span wires are being attached directly to the building and the poles discontinued.

Already a number of the larger buildings on River-side avenue have the span wires attached direct, among them being the Old National bank and the Paulsen building. The only place where the poles can not be removed is where the strain wires, which hold up the slack, are fastened, the fire ordinance prohibiting their removal. The work will take some time to complete, as all the poles can not be removed until the main streets are lined with modern structures that will permit the necessary strain. In many of the new buildings going up the builders have requested the company to furnish them eye bolts, by means of which the wires are attached to the building, the bolts being built in the building. About a year ago the work was started at the request of the chamber of commerce, but met with such a storm of protest that steel poles were put in instead. Lately the city commissioners requested again that the plan be tried. At corners, where the lines intersect, it is sometimes very difficult to get into buildings to hold the complex overhead layout, and then it becomes necessary to put in poles. The span wires are properly insulated from the trolley wire, and there is absolutely no danger of the current entering the building.

MISCELLANEOUS

City Pier Nearing Completion

Philadelphia, Pa.—Announcement has been made by Acting Director Hasskarl, of the Department of Wharves, Docks and Ferries, that the substructure of the new municipal pier in course of construction on the Delaware River, below Vine Street, has been completed and turned over to the city. Work is now being rapidly pushed forward on the superstructure, and it is expected that this portion will be finished in record time. When completed, it is declared, the new pier will be one of the best on the Atlantic seaboard.

Want Municipal Telephone

Independence, Kan.—Petitions asking that the city commissioners call an election for a vote upon the question of establishing a municipal telephone system have been filed with the local board, signed by nearly 2,000 of the voters of Independence. The plan meets with popular approval. This is the outcome of the rebellion against the Kansas City Long Distance Telephone Company and its "party" phone system.

City Has Spent Important Sum on Parks

Kansas City, Kan.—In the fiscal year just ended Kansas City's expenditures for its park and boulevard system since its beginning in 1893 passed the \$10,000,000 mark. The expenditures last year were \$516,640.64. The total for 18 years is \$10,372,876.67.

No More Roller Towels After July 1st

Erie, Pa.—Time for the replacing of roller towels by individual towels in places where roller towels have been used has been extended by the Board of Health till July 1. At that time a sanitary towel approved by the Board of Health must be installed. When the resolution was adopted by the Board that the roller towel must go, the intention was to have the rule effective June 1, but complications having arisen regarding the execution of the order the time was extended. The extra time allowed is thought to be sufficient to allow all towel dealers in the city who have made a business of supplying offices and public places to make the change.

Playgrounds Approved by Expert

Erie, Pa.—Playgrounds in this city and the playgrounds movement underwent an expert investigation last week by Rowland Haynes, of New York City, field secretary of the Playgrounds Association of America. Mr. Haynes states that he had learned no reason why Erie with beautiful parks and open spaces should not be one of the ideal playground cities in America. He was surprised that the people had not been awakened to the movement sooner, and spoke in approval of all the local playground advocates had accomplished.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Telephone Ordinance—Validity

Ex parte Farnsworth.—Special Acts 30th Legislature, enacted a city charter containing initiative and referendum provisions, which empowered the city to regulate and fix charges of local telephones, and delegated such power to the board of commissioners or city council, who were required to give notice and grant hearings to parties affected by the regulations, and provided for petition for a proposed ordinance and a submission of it to vote. The board without itself enacting any ordinance relating to telephone rates or making rules for notice and hearing of a proposed ordinance relating thereto received a petition for a proposed ordinance regulating telephone rates, and submitted it to the people at a special election, at which it received a majority of votes, and by order of the board was placed with the city ordinances as an enacted ordinance. *Held*, that the ordinance as enacted was invalid. No ordinance of an incorporated city is valid unless and until the statutory prerequisites to its enactment are substantially complied with.—Court of Criminal Appeals of Texas, 135 S. M. R., 338.

Street Encroachments—Awnings

City of Helena v. Wooten.—Kirby's Dig., providing for the prevention and removal of encroachments or obstructions upon any city street or sidewalk, contemplates that cities shall have control of their streets, and that an unauthorized private stationary awning extending in whole or in part over the sidewalk, which is in a good and safe condition, but which might interfere with the fire department, is an "encroachment" on the street, and an ordinance requiring its removal is authorized. It is no objection to the validity of a city ordinance requiring the removal of a stationary awning as an encroachment upon the street that at the time it was put up it was lawful, since it will be presumed that the owner has been fully compensated by the use and enjoyment of the same for all expenditures made upon the faith of the permission or license obtained from the city.—Supreme Court of Arkansas, 135 S. W. R., 828.

Injury in Public Place

City of San Antonio v. Ashton.—In an action against a city for injuries from falling over a tent stake in a plaza which stake had been used in connection with a tent of an amusement association, and had originally been with the others roped in to prevent injury therefrom, but which stake, there was evidence to show, was entirely outside of the inclosure when the accident happened, a charge that if the city used ordinary care in protecting persons traveling across the plaza from falling over the stake by roping it in, and if it could not reasonably be anticipated that any one using ordinary care in crossing the plaza would cross such rope and be injured by falling over the stake, the verdict should be for defendant, was properly refused, since under such charge, if the rope had originally been with due care placed to inclose the stake, the exercise of due care by the city would not require the maintenance of the rope in such position.—Court of Civil Appeals of Texas, 135 S. W. R., 257.

Independent Contractors—Acts of City Engineer

Denny vs. City of Burlington et al.—Where a city hired an independent contractor to construct a reservoir and the work was proper and lawful, and not intrinsically dangerous, the city is not liable for injuries received by one of the contractor's servants while doing the work, unless the city retained control or supervision over it. A city engineer having no authority to assume control over the work of an independent contractor did not bind the city by making suggestions as to how the contractor should perform his work thus removing the relation of master and independent contractor.—Supreme Court of North Carolina, 70 S. E. R., 1085.

Water Bonds—Ultra Vires—Defences

Wykes v. City Water Co. of Santa Cruz et al.—Where a city with power to purchase, hold, and enjoy real estate, and to sell and dispose of the same for the common benefit, in order to obtain a water works system, conveyed certain rights of way and other property to a private corporation in order that the corporation might issue bonds secured by a mortgage on the property for an amount required to build the works beyond the limit of the city's indebtedness as then fixed and after the city's debt limit was extended, the city regained control of the water works system in accordance with a vote of the people, it was estopped to claim that the bonds so issued by such private corporation which the city assumed were invalid, as ultra vires, because the entire scheme was a mere device to evade the debt limit.—United States Circuit Court, 184 F. R., 752.

Vacation of Streets—Public Use

City of Gary v. Much.—The existence of the power to take private property for public use by eminent domain excludes the idea that it might be taken for private use or under semblance of public use, and immediately or ultimately conveyed to private uses, and land cannot be taken under such power because the public will be incidentally benefited by the use to which private persons will put the land, so long as the public has no right of control, and a city could not vacate a highway to make it possible for several railroad companies to convert it into an exchange yard for the handling of the product of a large industry in the city, though the city would be thereby indirectly benefited together with individual property in the city because of the increased facility with which the product of the industry could be handled; such vacation of the highway being for a private use.—Appellate Court of Indiana, 94 N. E. R., 583.

Paving—Public Improvements—Districts

State ex rel. Granite Bituminous Paving Co. v. City of St. Louis et al.—Under a charter making one-half of each block fronting on a street chargeable with the cost of improving it, and providing that lots used as one parcel of ground shall be regarded as one lot for the purpose of issuing tax bills, the fact that lots fronting on an improved street are used in connection with rear lots fronting on the next parallel street does not authorize the extension of the boundary of the benefit district to the latter street.—Supreme Court of Missouri, 135 S. W. R., 928.

Regulating Exercise of Street Railway Franchise

Brode vs. City of Philadelphia et al.—The constitution does not prohibit the General Assembly from empowering a municipality to contract for payment to it by a street railway company or motor power company operating such other company's property of fixed sums in lieu of the performance of certain duties, or of the payment of license fees or charges imposed in its favor by general law or ordinance, or by the charter of the leasing or operating company; and the Legislature, in the exercise of such power, may direct that a municipality in making such contract may, for protection of its rights under the contract, provide that a certain number of persons shall act as directors of the company, and in conjunction with the directors elected by the stockholders thereof.—Supreme Court of Pennsylvania, 79 A. R., 659.

Construction and Maintenance of Lighting Plant—Statutes

State ex rel. City of Chillicothe v. Gordon, State Auditor.—Since the title of Laws 1897, enabling cities, etc., to issue bonds for the purpose of constructing or purchasing electric light plants, etc., purports to specifically enumerate all the powers intended to be granted, but does not contain the words "to maintain and operate," such powers are by necessary implication excluded, and hence so much of section of said act as purports to grant power to issue bonds to maintain and operate an electric light plant conflicts with Constitution, requiring the subject of each bill to be clearly expressed in its title. Where a statute authorized a city to issue bonds to erect an electric light plant, the use of the word "construct," instead of "erect," in city ordinances providing for the issuance of bonds was immaterial; the word "erect" meaning "to construct."—Supreme Court of Missouri, 135 S. W. R., 929.

MUNICIPAL APPLIANCES

Buffalo Duplex and Triplex Pumping Engines

The Buffalo Steam Pump Co., Buffalo, N. Y., manufacture duplex and triplex pumping engines for water works and general service. The steam and water ends are both simple, and the valve areas are ample, with water passages carefully proportioned, permitting high speeds in case of fire or other emergencies without jar or water hammer. These pumps are made in seventeen sizes, having rated capacities varying from 233 to 1598 gallons per minute. The dimensions of the smallest size are as follows: Diameter steam cylinders, 12 inches; diameter water pistons, 6 inches; length of stroke, 12 inches; rated piston speed, feet per minute, 233; rated capacity, gallons per minute, 233; diameter steam pipe, 2½ inches; diameter exhaust pipe, 3 inches; suction, 6 inches; discharge, 5 inches; approximate width and length, 31 by 94 inches. The dimensions of the largest size pump are: Diameter steam cylinders, 20 inches; diameter water pistons, 14 inches; length of stroke, 18 inches; rated piston speed, feet per minute, 100; rated capacity, gallons per minute, 1598; steam pipe, 4 inches diameter; exhaust pipe, 5 inches; suction, 12 inches; discharge, 10 inches; approximate width and length, 50 by 116 inches.

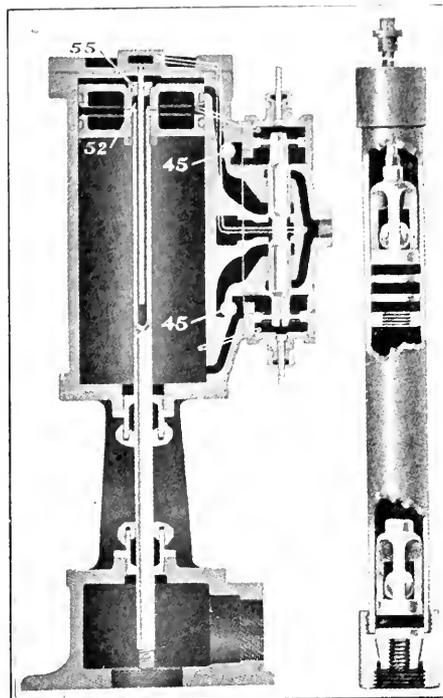

Buffalo Class N triplex pumps are made in capacities varying from 293 to 1500 gallons per minute. The frame consists of four vertical standards of box design, giving great strength with moderate weight. These bearing supports are mounted directly on the heavy cast-iron sub-base and are spaced and held together by the cross-head guides bolted between them. This construction affords a bearing each side of each crank and avoids using gears as crank discs, thereby preventing gear wobble and noisy operation. The crankshaft is of open-hearth steel, forged from the solid billet and machined all over. The crankshaft and pinion bearings are very large and babbitted, peined and scraped. Double gears and pinions are of the best charcoal iron cut from the solid. Gear guards are furnished for the pinions.

Crossheads are fitted with adjustable babbitted shoes which run in bored guides. Crosshead pin is of steel, under oil. Connecting rods are open-hearth steel castings with large babbitted boxes with wedge adjustment at crank end, and bronze boxes with wedge adjustment at crosshead end. Cylinders consists of three separate castings of close-grained iron, all machined to template, and provided with raised edge at top to catch all drip. Plungers are of hard cast iron. Glands are cast iron, allowing ample packing space. Valve boxes are multiple type, machined to template, with ample hand-hole openings and covers, large valve areas, no air pockets and direct water ways. The valves are medium rubber disc valves on bronze grid seats with cylindrical brass springs.

The details of the smallest size pump are as follows: Diameter plungers, 8 inches; stroke, 10 inches; gallons per revolution, 6.5; revolutions per minute, 45; gallons per minute, 293; maximum working pressure, pounds, 200; suction, 6 inches; discharge, 6 inches; gear ratio, 5.5 to 1; tight pulley, with outward bearings, 48 x 10 inches. The details of the largest engine are: Diameter plungers, 16 inches; stroke, 16 inches; gallons per revolution, 41.7; revolutions per minute, 36; gallons per minute, 1500; maximum working pressure, 150 pounds; suction, 12 inches; discharge, 10 inches; gear ratio, 6 to 1; pulley, special size as ordered. The truck horse-power required to operate this pump against a head of 100 feet is 58.

Deep Well Pump and Cylinder

The American Steam Pump Company, Battle Creek, Mich., manufacture the Marsh deep well engine and several styles of well pump cylinders. The accompanying sectional cut of well engine illustrates the construction. In operation the steam piston head contains a reservoir of live steam which is supplied from the upper chamber of the chest above the valve, following the passage indicated by dotted lines to the central cap in cylinder cover, through attached tube and hollow piston rod. This pressure is used only for "tripping" or reversing the valve

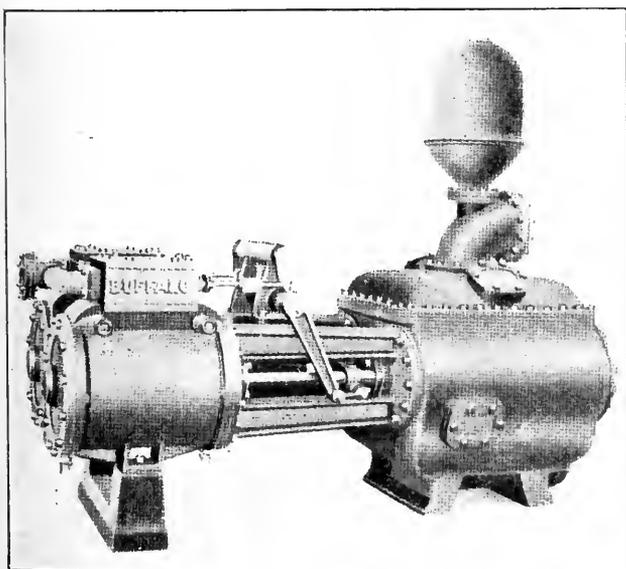

DEEP WELL PUMP AND CYLINDER

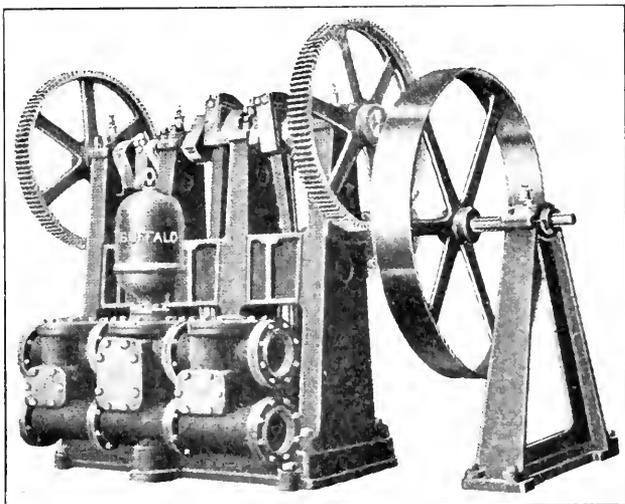

by admitting steam alternately against the enlarged heads of the valve through the connecting passages at either end of the steam cylinder.

The regulating valves, No. 45, are for equalizing the motion of the rod when used in connection with single-acting water cylinders, where the work is all on the "up" stroke, and the weight of a heavy rod might otherwise cause the piston to drop too suddenly, the lower screw restricting the exhaust and the upper screw limiting the amount of steam admitted for down stroke. In regulating these valves they should not be closed entirely, for the engine would stop. When properly adjusted the piston speed will be about alike in both directions.

These engines are made in eight sizes, varying from 4 by 6 to 10 by 36. The sizes of the water cylinder are varied according to the height to be pumped. For instance, the 4 by 6 engine, with 40 revolutions per minute, elevates 900 gallons per hour a height of 25 feet; with a 4½-inch cylinder or with a 1½ cylinder, 110 gallons 300 feet. The 10 by 36 engine, 18 revolu-

BUFTALO DUPLEX PUMPING ENGINE

BUFTALO TRIPLEX PUMPING ENGINE

tions per minute, with 8½-inch water cylinder, elevates 9,400 gallons per hour 80 feet, or with a 4¼-inch cylinder 2,350 gallons 300 feet.

The well pump cylinders with bronze ball valves are intended for the heaviest and most exacting service. The shells are of heavy seamless drawn brass tubing; the valves, plunger, caps, etc., are of the best phosphor bronze. Top attachment is always made larger than inside bore of water cylinder to allow withdrawal of plunger and lower valve cage without disturbing well pipe.

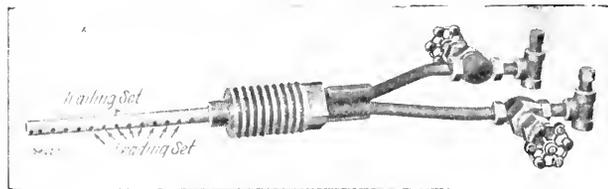

Water Flow Meter

The General Electric Company, Schenectady, N. Y., has placed on the market a water flow meter designed to measure the flow of water in mains and for other purposes. The operation of the meter depends on the principle that rate of flow is proportional to velocity. To measure this a nozzle plug is screwed into the pipe at the

the mean velocity pressure due to the flow of water. The meter, it is said, will give accurate results when measuring water delivered by reciprocating as well as centrifugal pumps, provided the pulsations are eliminated through the use of air chambers. The G. E. water flow meters are calibrated to read in gallons per minute at 39.1 deg. F.

To install the meter under normal conditions, there is no interference with the water piping, all that is necessary being to drill and tap a ½-in. hole in pipes of less than 4 in. in diameter, or a ¾-in. hole in pipes 4 in. and over in diameter. The hole should be drilled in the pipe so that the axis of the nozzle plug is in the plane of the preceding elbow. The nozzle plug must be placed in a straight run of pipe at least eight pipe diameters in length and with its axis in the plane of the preceding elbow. The meter may be located in any desired place below the nozzle plug to which it is connected by ¼-in. iron pipe.

The meter consists of two cylindrical, hollow cups filled to about half their height with mercury and joined at the bottom by a hollow tube. This arrangement of cups and connecting tube forms a "U" tube,

PIPE TO BE INSERTED IN MAIN

point where the water flow is to be measured. One set of openings in the nozzle plug, called the leading set, extends horizontally across a diameter of the water main and faces against the direction of flow. The other three openings, one opposite, the others at right angles to the leading holes, near the center of the plug, constitute the trailing set. The water impinging against the leading set of openings sets up a pressure in them which equals the static pressure, plus a pressure due to the velocity head. The pressure in the trailing set is equal to the static pressure, minus a pressure due to the velocity head. Since the leading set of openings extends approximately across a diameter of the pipe, the velocity pressure transmitted to the meter is

which is supported on and is free to move as a balance about a set of knife edges. A difference of pressure in the nozzle plug is communicated to the cups by flexible steel tubing placed inside the case. This difference of pressure causes the mercury to rise in the left-hand cup and fall the same amount in the right-hand cup until the unbalanced columns of mercury exactly balance the difference in pressure. By the displacement of the mercury, the beam carrying the cups moves downward on the left-hand side of the knife edges. This side will descend until the moment of the weights on the right side of the knife edges exactly balances the moment caused by the displacement of the mercury into the left-hand cup. The motion of the beam is multiplied by levers, and actuates the pen which moves in proportion to the amount of mercury displaced. The time element of the meter

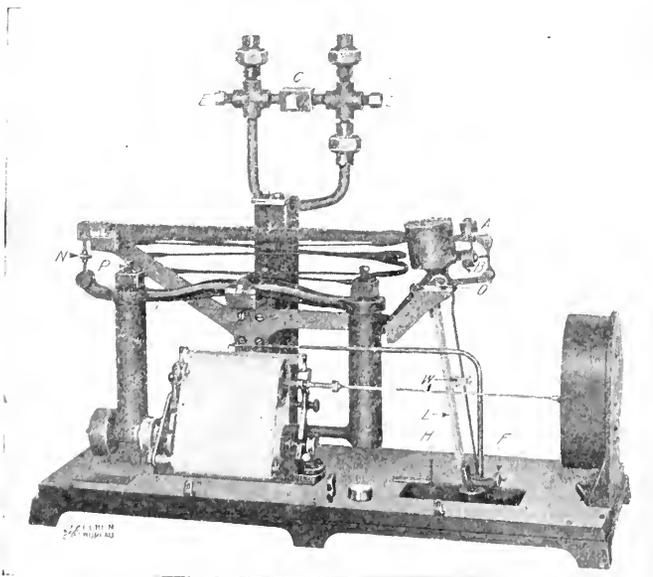

consists of an eight-day clock which drives the drum feeding the paper. The paper on which the record is made is so calibrated that the rate of flow in gallons per minute may be read at any instant or the average rate calculated for a given time. Meters are equipped with a roll device operated by a spring mechanism, and this device is of sufficient capacity to accommodate one complete roll of paper.

Duplex Inverted Mantle Street Lamp

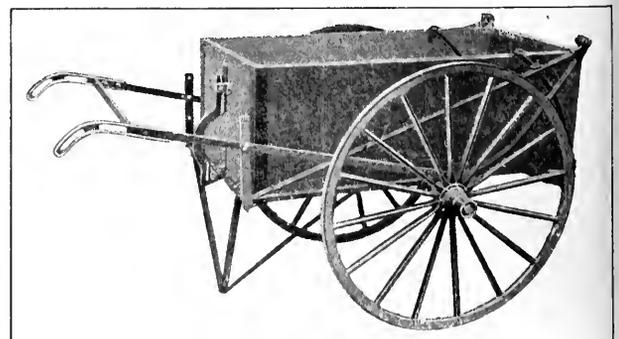

The Welsbach Street Lighting Company of America has recently perfected a new street lighting unit of increased candle-power. The candle-power is 150, which is said to be delivered with a relatively small increased gas consumption over that of the present 60-candle-power lamp, considering the greater illuminating effect produced. It consists of a burner for two inverted mantles. By the arrangement of the various parts a higher regenerative effect is produced, giving a uniform mixture of gas and air to the mantles. The result is a steady unflickering light. The natural tendency of the inverted gas flame to be affected by pressure variations and air draughts has been overcome by means of a perfected gas controller and chimney arrangement. The enclosing lantern is the Boulevard type. Owing to the high diffusive and effective distribution qualities of the light sources, the new units can be placed on the gas posts now in use without alteration of the height above the street surface.

Automatic Dumping Street Cleaning Cart

An automatic dumping cart suitable for street cleaning purposes has been placed on the market by the Baker Manufacturing Co., 337 West Madison street, Chicago, Ill. The sweeper works with the cart by his side; the body sets low enough to make shoveling easy. In small cities where the dumping place for street sweepings is not far away the cart may be pushed to the dump and unloaded, thus saving the expense of carting. The cart is heavily built, it is said, of the best materials. It weighs 200 pounds and can carry a load of 1000 pounds, although, of course, a load of sweepings of 10 cubic feet, its capacity, would not ordinarily weigh so much. The wheels are 36 in. in diameter, wood-sarvin construction, with ¾-in. spokes and rim one inch wide. The axle is of steel one inch square. The handles, framework, etc., are of steel and malleable iron. The box measures 2 ft. by 4 ft. by 1 ft. 3 in. The wood is one inch thick with corners and edges protected with steel strips. The box is hinged on the axle. The cart is dumped by a simple device.

NEWS OF THE SOCIETIES

National Good Roads Association.—

The fourth national congress met at Birmingham, Ala., May 25, with representatives from fifteen States present. The floor of the Jefferson Theatre was blocked off by States, while the stage contained seats for the speakers and specially invited guests. The meeting was called to order by John W. O'Neill, president of the Jefferson County Good Roads Association and chairman of the local advisory board of the congress. Governor Emmet O'Neill made the address of welcome. He mentioned the fact that since the last convention the State of Alabama had established a Highway Commission. A large number of applications for State aid had already been received. Job Going, Birmingham, welcomed the convention in behalf of the county, Commissioner James Weatherly in behalf of the city, John W. Craft for the Alabama Good Roads Association, Judge William I. Grubb for the Jefferson County Good Roads Association, Robert W. Massey for the Chamber of Commerce, B. H. Cooper for the Board of Trade, F. P. Chaffee for the Business Men's Club, and Dr. J. E. Dedman for the Motor Club. The convention was then turned over to President Arthur C. Jackson, Chicago, who made the annual address. E. J. Watson, Commissioner of Agriculture, South Carolina, made a brief review of good roads building, tracing it back to the work of Napoleon.

The meeting endorsed a proposal on the part of the Daughters of the American Revolution, made through Mrs. A. O. Lane, for the building of a Jackson memorial highway. The route of the highway lies from the old home of Andrew Jackson in Tennessee through Huntsville, Birmingham, Tuscaloosa, Mobile and thence to New Orleans. This thoroughfare is intended to connect with the Davis-Lincoln memorial highway in Kentucky and thence with a public highway to extend to Chicago. The support of the congress was unanimously pledged the ladies in the building of memorial highways, and they were granted the privilege of naming all such roads that may ever be built.

S. W. MacCallie, State Geologist of Georgia, gave a history of Georgia road laws and the employment of convict labor.

Jesse Taylor, secretary of the Ohio Good Roads Federation, gave a description of the road system of Ohio. He spoke of the need of a road maintenance fund.

Dr. Joseph Hyde Pratt, State Geologist of North Carolina and secretary of the North Carolina Good Roads Association, spoke on State supervision of public roads.

J. C. Clair, industrial and immigration commissioner Illinois Central Railway, explained the interest of railroads in good roads, and stated that ten years ago the Illinois Central had operated a good roads train upon a similar plan to that which is now being pursued by the Southern Railway.

Logan Waller Page, Director United States Office of Public Roads, made an address on the progress of road improvement in the South. He said that 25,000 miles of road had been improved in the South between 1904 and 1909; since then the total of improved mileage had reached 42,280, or 6.67 per cent.

of all roads in the South. At the present date there is available for expenditure throughout the sixteen Southern States the sum of \$40,652,000, or \$59 per mile. Practically one-third of all funds available for expenditure on roads during 1911 are available in the sixteen States. He spoke of the different conditions prevailing in the South as affecting road construction—more rain in the winter and little or no frost.

A. G. Batchelder, New York, chairman, executive committee, American Automobile Association, speaking of automobiles and good roads, said that the association he represented would demand ultimately that all vehicles used on public roads be taxed for the maintenance of the highways, because they claim that it is unjust for automobiles alone to be discriminated against where the wear and tear of roadbeds is due to antagonistic methods of travel.

Prof. G. N. Mitchell, Alabama University, described the work of the newly created commission in Alabama, of which he is a member.

Will P. Blair, secretary National Paving Brick Manufacturers' Association, gave an illustrated lecture on brick paving on country roads.

Senator John H. Bankhead spoke of the duties of the Federal Government in road building under the Constitution, declaring that Congress has the power to establish post roads.

W. S. Keller, State Highway Engineer of Alabama, made an address on practical road construction in Alabama.

A number of other addresses were made regarding various phases of the road problem. The secretary's report showed that 1364 delegates had registered at headquarters. A plan for consolidating all national good roads associations into one organization next December was referred to a special committee, of which Senator J. H. Bankhead was made chairman. Representative Richmond P. Hobson read before the Assembly a copy of a bill which he proposes to introduce in Congress providing for a national highway survey.

New York State Conference of Mayors.—The fourth session assembled at Columbus Institute, Poughkeepsie, Friday morning, May 26, Mayor D. E. Sheehan, Binghamton, presiding. C. R. Hall, State Comptroller's office, read a paper on "State Examination of Municipal Accounting, Purposes and Results." The speaker stated that the object sought by the State Comptroller was to establish a uniform system of accounting for all municipalities if it could be done. If not, then uniform systems for each class of municipalities. The result of the work so far had been to discover little dishonesty but much laxity and inefficiency. The Comptroller examines the accounts of 57 counties, 46 cities and 446 incorporated villages. A. W. Crawford, assistant city solicitor, Philadelphia, made an address on "City Planning and Municipal Indebtedness," showing how the cost increases as the carrying out of plans is postponed. H. M. Williams, Erie Railroad, spoke of "Assessments of Railroad Properties Within City Limits." The speaker argued that structures built for the purpose of eliminating grade crossings, which were public benefits, should not be taxed. He would prefer a system of taxation based on a fixed rate on net earnings. John MacVicar, Des Moines, Ia., spoke on

"Commission Government," reviewing its history and pointing out the results where it had been tried. Richard S. Childs, secretary of the Short Ballot Organization, spoke of "Commission Government and Ballot Reform." Ernest C. Meyers, Census Bureau, Washington, spoke of the difficulties in obtaining statistical information from cities, and attributed it largely to lack of proper accounting systems in the cities. D. D. Frisbie, Speaker of the Assembly, spoke on "Restricting a City's Powers of Self-Government by the State Legislature." He said that the Legislature should refrain from charter changes dictated solely by the desire to secure petty political advantages and confine itself to such changes as experience and wisdom dictated.

A definite move was made for the formation of a permanent organization, and a proposed form of charter was read. On Saturday, the last day of the meeting, the delegates went by boat and train to the site of the Ashokan dam. Two addresses were made, "The Future of Municipal Water Supply in New York State," by Walter McCullough, State Water Supply Commissioner, and "Catskill Water Supply," by Seth Low, ex-mayor, New York City.

Next year's meeting will be held in Utica. Among the letters received from prominent persons who were unable to attend was the following from ex-President Roosevelt:

May 19, 1911.

Mayor Charles Duryee,

My Dear Sir: I sincerely regret my inability to accept your invitation to address the conference of mayors to be held at Poughkeepsie, May 25-27, 1911. I regard as exceedingly important the fact that the mayors and other municipal authorities of the cities of this State have formed an organization for the discussion of the many and important problems which they have in common. A very decided improvement in the standards of municipal administration, and in the development of sound municipal policies, should result from such discussion. Municipal government touches the lives of citizens at many points and in very important ways. Improvement in municipal administration cannot be imposed from above, but must develop first, from an enlightened and aroused public interest in municipal affairs, and second, from the development of expert officials, well and soundly informed on the diverse lines of work in municipalities.

As concerns the particular problem on which you asked me to speak—the work of a police department—I can only say that while it will always be necessary to keep a municipal force for the repression of crime, yet that we ought to do much more than is now done towards the abolition of the conditions that tend to breed crime. The provision of wholesome and sufficient opportunities for recreation for young and old, which is clearly a municipal function, is one of the things which will go far towards simplifying the problems of police administration.—I am, Very truly yours,

THEODORE ROOSEVELT.

Recreation Alliance of New York City.—The Recreation Alliance of New York City was organized May 15 at a meeting in the Metropolitan Building of representatives of practically all the recreation societies in the city. Eugene Philbin, president of the Parks and Playgrounds Association, presided. On a resolution offered by Dr. Henry Moskowitz, the representatives of the various organizations interested in recreation assembled at the meeting indorsed the bill backed by the Board of Estimate, and based upon the report made to that body by the Borough President, providing for a recreation commission, consisting of the president of the Park Board, a representative of the Board of Education and five citizens serving without pay, to be appointed by the Mayor.

American Society for Testing Materials.—The fourteenth annual meeting will be held at Hotel Traymore, Atlantic City, N. J., June 27-July 1. Among the papers to be presented are the following of general municipal interest.

Tuesday, June 27, 3 P. M.—Report of Committee A-3 on standard specifications for cast iron and finished castings; Walter Wood, chairman. Report of Committee C-4 on standard specifications and tests for clay and cement sewer pipes; Rudolph Hering, chairman. Report of Committee C-3 on standard specifications for paving and building brick; D. E. Douty, chairman.

Tuesday, June 27, 8 P. M.—Address by the president, American Society for Testing Materials. "Measured Strains on Engineering Structures," James E. Howard.

Wednesday, June 28, 10 A. M.—Report of Committee A-1 on standard specifications for steel; William R. Webster, chairman.

Wednesday, June 28, 8 P. M.—Report of Committee D-1 on preservative coatings for structural materials; S. S. Voorhees, chairman. Report of Committee A-5 on the corrosion of iron and steel; Allerton S. Cushman, chairman. "The Practical Testing of Drying and Semi-Drying Paint Oils," Henry A. Gardner.

Thursday, June 29, 10 A. M.—"Practical Tests of Sand and Gravel Proposed for Use in Concrete," Russell S. Greenman; "Some Experiments on the Incrustation and Absorption of Concrete," Abel O. Anderson; "The Determination of Stresses in a Reinforced Concrete Member Subject to Axial Load in Flexure," S. Ingberg; "The Expansion and Contraction of Concrete While Hardening," Albert T. Goldbeck; "The Properties of Magnesium Cement, Mortars and Concretes," C. Darleth, Jr., and A. C. Alvarez; "Disintegration of Concrete," Alfred H. White.

Friday, June 30, 10 A. M.—Report of Committee D-4 on standard tests for road materials; L. W. Page, chairman. "A New Consistometer for Use in Testing Bituminous Road Materials," W. W. Crosby; "Improved Instruments for the Physical Testing of Bituminous Materials," Paper III, Herbert Abraham; "A Proposed Method of Testing the Melting Point and Softening Point of Compounds," Henry W. Fisher; "Organic Residues from Soluble Bitumen Determinations," Prevost Hubbard and C. S. Reeve.

Friday, June 30, 3 P. M.—"Standard Methods for Testing Sewer Pipe and Drain Tile," A. Marsten; "A New Type of Autographic Transverse Testing Machine for Research Testing or Regular Foundry Practice," T. Y. Olsen.

Saturday, July 1, 10 A. M.—"Recent Analyses of Tests on Structural Timbers Made by the Forest Service," McGarvey Cline.

Health Officers' Association of New Jersey.—The association held its first banquet May 23 at Achtel Stetter's, with about fifty members in attendance. The toastmaster was Chester W. Wells, of Montclair, and among the speakers were Colonel George P. Olcott, Dr. A. Clark Hunt, Dr. R. B. Fitz Randolph, George W. McGuire and Dr. Richard C. Newton. An amendment to the constitution was adopted permitting any employee of a board of health who has a State license to become an active member. All passive members of State or local boards may become associate members.

Calendar of Meetings

- June 6-8.
Engineers' Society of Pennsylvania.—Annual Meeting at State College, Pa.—E. R. Dasher, Secy., P. O. Box 704, Harrisburg, Pa.
- June 6-10.
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 8-10.
National Association of Comptrollers and Accounting Officers.—Annual Convention, Arlington Hotel, Washington, D. C.—George M. Rex, Secretary, 525 Industrial Trust Building, Providence, R. I.
- June 11-16.
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- June 22-24.
Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.
- June 27-July 1.
American Society for Testing Materials.—Fourteenth Annual Meeting, Hotel Traymore, Atlantic City, N. J.—Edgar Mackay, Secretary, University of Pennsylvania, Philadelphia, Pa.
- June 28-29.
South Carolina Water Works Association.—Meeting for Organization, Columbia, S. C.—W. F. Steiglitz, Temporary Secretary, Columbia, S. C.
- June 28-30.
International Association for the Prevention of Smoke.—Annual Convention, Newark, N. J.—R. C. Harris, Secretary, City Hall, Toronto, Ont.
- August 15-18.
Firemen's Association of the State of New York.—Rochester, N. Y.—Thos. Honohan, Secretary, Frankfort, N. Y.
- September 12-15.
International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 18-30.
International Municipal Congress and Exposition.—Chicago, Ill.—Curb M. Treab, Secretary, Great Northern Building, Chicago, Ill.
- September 18-October 1.
Fourth International Good Roads Congress.—Chicago, Ill.—J. A. Rountree, Secretary, Birmingham, Ala.
- September 19-22.
International Association of Fire Engineers.—Annual Convention, The Auditorium, Milwaukee, Wis.—James McFall, Secretary, Roanoke, Va.
- September 19-22.
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6.
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.
- November 13-17.
National Municipal League.—Annual Meeting, Richmond, Va.—Clinton Rogers Woodruff, Secretary, North American Building, Philadelphia, Pa.

PERSONALS

ARDREY, HOWARD, has been appointed Chairman of the Executive Committee of the City Plan and Improvement League of Dallas, Texas.

BROWN, LEGRAND, Vice-President and Chief Engineer of the General Electric Power Company, of California, spoke recently before the Rochester Engineering Society on the hydroelectric power development of California. He described in detail and illustrated his talk by lantern slides, the proposed development, which will be one of the most important in the State.

CHALLEN, VICTOR, has been appointed a member of the Board of Police and Fire Commission of San Jose, Cal.

CRUM, EMORY C., is the new City Engineer of Frederick, Md.

FISHER, E. A., City Engineer of Rochester, N. Y., has been given charge of Exposition Park, and is authorized to lease the grounds to outside parties at his discretion.

FRASER, S. R., has been appointed Chief of Police of Tacoma, Wash., succeeding Thomas Malony.

FUERTES, J. H., Hydraulic Engineer of New York City, has been given complete charge of the construction of the new water plant at Cumberland, Md.

HASKINS, DR. THOMAS M., has been re-elected a member of the Board of Control of Wheeling, W. Va.

JOHNSON, JOSEPH, JR., has been appointed Fire Commissioner of New York City. The appointment is a promotion, as he had been Deputy Commissioner under Commissioner Rhineland Waldo, who was recently transferred from the head of the Fire Department to be Police Commissioner.

MCDONALD, R. E., hydraulic engineer of Kansas City, Mo., has been called to Green Bay, Wis., to consult with the authorities in regard to the valuation of a water plant which may be purchased.

MURDEN, CHAS. E., former Chief of the Fire Department, has been elected Street Inspector of Portsmouth, Va.

RIDGELY, RUXTON M., has been selected by Mayor Preston as a member of the Commission on City Plan of Baltimore to succeed Josias Pennington, who has been promoted to the presidency, in place of Francis K. Carey, resigned. The name of Mr. Ridgely was sent to the Second Branch of the City Council along with the promotion of Mr. Pennington. Both were unanimously confirmed.

RUMBOLD, FRANK, has been appointed Commissioner of Public Works of Tona-wanda, N. Y.

STEVENS, JOHN W., has been elected President of the Board of Water Supply of Mt. Vernon, N. Y.

TILDEN, H. O., of New York, a lecturer and agitator for better sanitation in the cities, visited Dayton last week upon his nine months' tour of the United States and Philippines in the interest of better sanitation. Mr. Tilden delivered talks in connection with Mayor Burkhardt's addresses at the schools of North Dayton.

UNWIN, RAYMOND, one of the foremost architects of England, recently visited Rochester at the invitation of the Civic Improvement Committee, and delivered an illustrated talk on Town Planning.

WARREN, GEO. C., has been appointed City Comptroller of Saginaw, Mich.

WILSON, WOODROW, Governor of New Jersey, visited Seattle, Wash., during a recent trip through the West, where he delivered an address on The Commission Form of Government, before a large audience.

INDUSTRIAL NEWS

Cast Iron Pipe.—Chicago: Municipal buying has been very satisfactory and inquiries are numerous. Prices are firm. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: Shipments are good and prices firm. Large shipments are going daily to New Orleans and to California. There is no increase in stocks. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, average, \$21. San Francisco: Movement of pipe is fairly active, many water and gas companies being in the market. New York: Market is quiet. Quotations: 6-inch, car load, \$21 to \$22.

Lead.—Demand is light. Quotations: St. Louis, 4.225c.; New York, firm at 4.375c.

Artesian Well Pumping.—The seventh annual report of the Memphis, Tenn., Water Department states that the system of segregated pumping (Wills' Pumping System), which takes the water from each well and forces it into the main, under pressure, at one operation, was given a most strenuous test of eight months constant running with such satisfactory results that an order was placed for four more units. The commission believes that this system of pumping has solved the water question for Memphis, as the saving in first cost per million gallons capacity is 75 per cent. and the cost of the water pumped much less than at either of the other pumping stations. The pumps used are made by the Hill-Tripp Pump Company, Anderson, Ind.

Hand Street Cleaners.—The Menzies Street Cleaner Company, Glens Falls, N. Y., recently shipped to the city of Macon, Ga., sixteen street cleaners. Eight machines were forwarded in a first order, and soon after a letter was received by the company stating that the machines were doing such satisfactory work that the city wished to place an order for eight more to be shipped at once.

Cement Shows.—The Cement Products Exhibition Company, 72 West Adams Street, Chicago, Ill., have announced the following dates for the New York and Chicago cement shows next year: Second Annual New York Cement Show, Madison Square Garden, Jan. 29 to Feb. 3, 1912; Fifth Annual Chicago Cement Show, Coliseum, Feb. 21 to 28, 1912.

Concrete Mixers.—To take care properly of its rapidly increasing concrete mixer business, the Standard Scale & Supply Company, Pittsburgh, Pa., manufacturer of the Eclipse concrete mixer, has found it necessary to increase the size of its large plant at Beaver Falls, Pa., by the addition of a steel fireproof building 70 by 80 feet, for which the machinery has already been purchased and installed.

Traction Engines.—The Vincennes Tractor Company, Vincennes, Ind., has been incorporated, with \$50,000 capital stock, as manufacturer of engines. The directors are F. L. Oliphant, Edward Watson, Charles Bierhaus, B. F. Nesbitt, R. M. Robinson, W. M. Alsop.

Steam Shovels.—The Orton-Steinbrenner Steam Shovel Works, Huntington, Ind., though in operation only three weeks, is already making plans to double the size of the plant. Orders are in hand sufficient to keep the factory running until January 1.

Tungsten Lamps.—A factory for the manufacture of tungsten lamps will be established by the General Electric Company at Fort Wayne, Ind. The plant will be in operation in June, and by September it is expected that it will have a capacity of 5,000 lamps per day.

Water Company Would Sell.—The Creston (Ia.) Water Works Company wants to sell its plant to the city of Creston. It has submitted to Mayor Reynolds a proposition to sell for \$100,000. The plant has never paid and is in possession of the bondholders.

Public Utility Compromise.—Litigation in the Court of Chancery lasting for three months between the Newark Water and Electric Company, Newark, Del., and the town, ended last week, when the water and light plants were turned back to the municipality. This agreement was reached out of court, largely through the active interest of Father Dougherty, who acted as arbitrator. The receiver appointed by the Court of Chancery some days ago had not qualified, in expectation of a compromise. It was the naming of this receiver which really brought about the agreement, as both sides desired to save the heavy receivership expenses.

Combination Signal System.—N. Banks Cregier, engineer of the Cregier Signal Company, Los Angeles, Cal., has submitted to the city a proposal for installing a complete fire alarm, police signal and municipal telephone system. An innovation suggested in Mr. Cregier's proposal is to install auxiliary police boxes in private houses, by which a signal may be sent automatically or a telephone conversation instantly obtained with the nearest police station. It is declared these boxes can be made quite profitable to the city at a regular yearly charge. The Fire Commission has referred the matter to the City Council with the request that the body name a special committee to confer with the commission on the subject.

Motor Fire Pump.—The Rochester Motor Fire Pump Company, Rochester, N. Y., has been incorporated with \$150,000 capital stock, the incorporators being R. S. McMahon, Leonard Fuchs, Dr. James T. McGovern, James L. Hotchkiss and A. E. Tuck. The company has acquired the rights to a patented pump. The pump, to be mounted on a fire apparatus, is said to have a capacity of over 1,000 gallons per minute.

Lighting Plants to Consolidate.—A deal has been consummated whereby the Utilities Corporation of New Jersey, owner of the Penn Central Light & Power Company, has acquired the holdings of the Hollidaysburg Electric Light & Power Company, thus bringing the lighting of the two Pennsylvania towns under the same management. A corps of engineers from the office of Dodge, Day & Zimmerman, of Philadelphia, consulting engineers of the Utilities Corporation, will be sent to this field at once and will determine the needs of Hollidaysburg, and there is no doubt but that thousands of dollars will be expended in enlarging the scope of the plant there. The same progressive spirit that has characterized the management of the Penn Central Company locally will be manifested at Hollidaysburg.

Rubber Tires.—The Toledo Tire & Repair Co., 241-3 Erie Street, Toledo, O., has secured the general distributing agency for the complete line of Firestone pneumatic, motor truck and carriage tires and rims.

Flaming Arc Lamps.—The Stave Electric Company, 27 West Twenty-seventh Street, New York City, has brought out two new types of lamps, one burning 100 hours without trimming and the other lasting from 150 to 200 hours. The general construction of these lamps is the same as their earlier type, of 10 and 17-hour lamps, and the carbons are fed by a motor. The heights of the two types are 32 and 37 inches, respectively.

Consulting Engineer.—R. Walter Creuzbaur, M. Am. Soc. C. E., has opened offices at 30 Church Street, New York City, for consulting practice in matters involving preliminary study, design, construction and operation of engineering utilities, and for references of cases in litigation requiring special knowledge of construction and interpretation of contracts. Mr. Creuzbaur has been until recently Consulting Engineer of Public Works, Brooklyn, N. Y.

Wood Paving Blocks.—A wood paving block preserving plant, according to press reports, is about to be established in Centralia, Wash. The initial cost of the factory will be \$40,000. L. R. Mason, of the Carbolineum Wood Preserving Company, Milwaukee, Wis., is the promoter of the enterprise and the process used will presumably be the Avenarius process. Local contracts are expected to give the new company a start. Waste lumber from the mills will supply a low-priced raw material.

Corrugated Metal for Intakes.—The Canton Culvert Company, Canton, O., has issued a folder in which they call attention to the new uses to which their corrugated metal culvert pipes are being put. Notable among these is the installation of an intake from a cut in the Connecticut River for the Hartford Electric Light Company, Hartford, Conn. A detailed account, with illustrations, of this installation is given. Besides this, the culvert metal is used for intakes, outlets, irrigation ditches, casings for electric wires, cables, gas mains, water pipes, collapsible forms for trestles and bridges and centering for concrete arches. The rust-resisting properties of the metal used by this company give their material special value for the purposes stated.

Lighting Merger.—As the culmination of efforts to place the electric lighting companies in several of the surrounding towns and cities under one corporation a certificate was filed in the County Recorder's office, Muncie, Ind., announcing the merger of the Muncie Electric Light Company, the Redkey Lighting Company, the Hartford City Lighting Company, the Dunkirk Lighting Company and the Eaton Electric Company. The corporation is to be known as the Muncie Electric Light Company. For several months the local electric light company has had a large force of men at work constructing lines from Muncie to all of the surrounding towns. Substations have been erected in all these towns and the current for all these towns will be furnished by the Muncie plant, which has been enlarged at an expense of several thousand dollars in the last two years.

Police Call System.—Harry E. Reed, a representative of the Gamewell Fire Alarm Company, called upon the Chief of Police and Mayor of Hazleton, Pa., last week, with a view of erecting a demonstrating model of their police call system in the police station. He was granted the permission, and as soon as the material arrives it will be placed in position.

Alternating Current Switchboard Panels.—The General Electric Company has just issued bulletin No. 4819, which is devoted to the subject of alternating current switchboard panels. The panels described are equipped with oil switches and are suitable for general use in the central stations and isolated plants. They are designed for use with one set of bus bars, to which all generators and feeders are connected by means of single-throw oil switches, and suitable provision is made for the parallel operation of generator. These panels are for use on three-phase three-wire circuits of 480 and 600 volts and 25 to 60 cycles. All of the panels are 90 inches high. The bulletin contains information, including dimension and connection diagrams, regarding three-phase generator panels, single circuit and double circuit three-phase feeder panels, generator voltage regulator panels and combination regulator and exciter panels and three-phase induction motor panels.

Switchboard Instruments.—The General Electric Company recently issued Bulletin No. 4825, which illustrates and describes a line of compact, accurate and moderate-priced instruments for use on alternating and direct-current switchboards. The bulletin contains dimension diagrams and also illustration showing the actual size of the meter scales. These illustrations will enable a prospective customer to see at a glance the ease with which readings may be made.

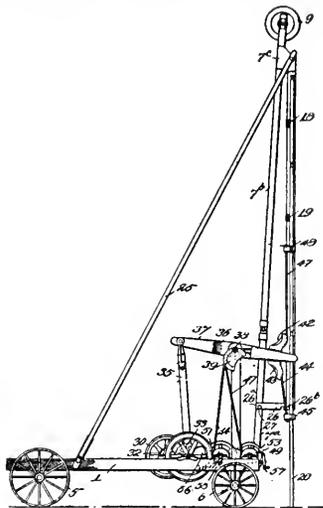

Manganese Steel.—A booklet containing an address on manganese steel by G. W. Kneisly before the National Paving Brick Manufacturers' Association has been published by the Edgar Allen-Manganese Steel Company, McCormick Building, Chicago, Ill. Manganese steel is most valuable for use where resistance to an abrasive action is required. Hence, it is extensively used for the jaw plates of rock crushers, the cutting edge of steam shovel buckets and for gearing of any sort of heavy machinery.

Concrete Bridge.—The Concrete Steel Engineering Company, Park Row Building, New York City, made the plans for the new bridge across the James River connecting Richmond, Va., with South Richmond. The bridge will be built in accordance with the Melan system, and Diamond reinforcing bars will be used. It is to have a concrete railing and a combination trolley and light pole of reinforced concrete. There will be eighteen arches, each having a span of 71 feet, with four abutments and sixteen piers. Seven of these arches cross the James River from Richmond to Mayo's Island and eleven from Mayo's Island to South Richmond. The total length of the bridge is to be 1,721 feet, with a roadway of 44 feet, and two sidewalks of eight feet each. Provision is made for water and gas mains, and three conduits of six sections each for power, police and telephone wires. The bridge is designed to carry 50-ton electric cars and will be provided with two tracks.

PATENT CLAIMS

993,882. **WELL-DRILLING DEVICE.** Ray R. Sanderson, Orrville, Ohio. Serial No. 592,470.

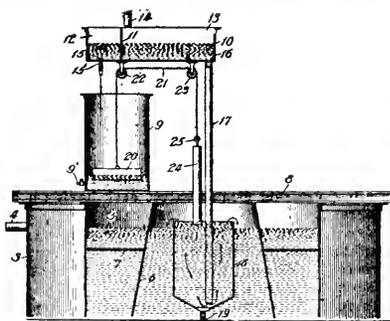

In a drilling device, a frame, a walking beam pivotally secured thereto, a mast, a guide-frame pivotally suspended from said mast, means for retaining the guide-frame

in position, a drill rod arranged to be guided by said guide-frame, and flexible connections between said drill rod and said walking beam for positively actuating the drill rod upwardly and downwardly.

993,663. **WATER-SOFTENING APPARATUS.** Francis S. Dunham, Chicago, Ill., assignor to Kennicott Water-Softener Company, a Corporation of Illinois. Serial No. 546,819.

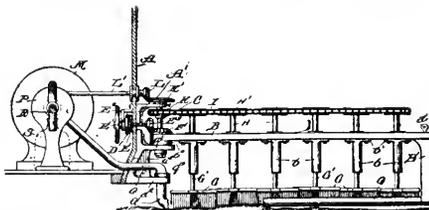

In a water-softening apparatus, means for supplying to the water to be treated therein the chemical treating-material in stick-form, comprising a tank, means for

proportioning the supply to the tank of said water, a float in the tank and mechanism for engaging the stick, connected with the float to be actuated by its rise to advance said stick, for the purpose set forth.

993,603. **STREET-SWEEPING APPARATUS.** Alva D. Jones, Louisville, Ky., assignor to American Street Cleaner Company, Louisville, Ky., a Corporation of Arizona. Serial No. 515,356. Renewed Oct. 24, 1910. Serial No. 588,900.

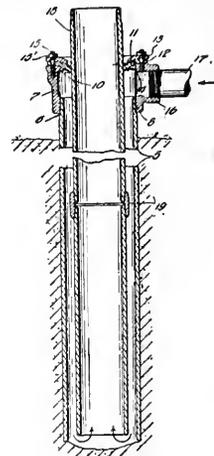

In a street sweeping machine, the combination with a vehicle, of a swinging frame hinged to said vehicle, a support for the free end of said frame, means for swinging said frame laterally, a series of rotary brushes mounted in said frame, and

having their axes substantially vertical, means for imparting vertical play to said brushes, suction pipes at each side of said brushes adapted to suck in the air and solid particles raised by said brushes, and a suction pump carried by said vehicle and connected to said suction pipes, substantially as described.

993,507. **WELL-BORING APPARATUS.** Asa G. Collins, Everett, Wash. Serial No. 523,678.

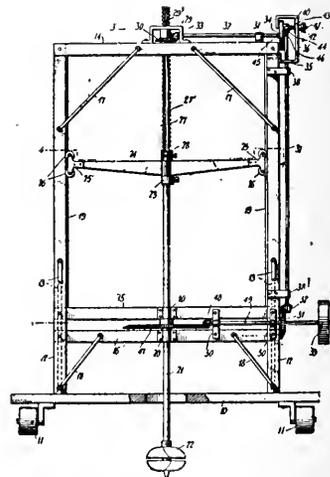

In a well boring apparatus, the combination with an inner sectional pipe member and an outer pipe member inclosing the inner member, and a pipe coupling for connecting the sections of the inner pipe member together, of a fitting detachably connected to the periphery of the outer pipe member and projecting above said outer pipe member, the inner diameter of that portion of the fitting which projects above said outer member being greater than the diameter of said pipe member, said fitting provided with a side opening and a screw-threaded socket for the reception of a water supply pipe, said fitting further pro-

vided at its upper end with an inwardly extending annular flange having a downwardly curved upper face and of a width to provide an opening of greater diameter than that of the pipe coupling, an elastic gasket seated upon said flange and of a diameter to snugly engage the periphery of the inner pipe member, a ring arranged over the coupling and provided with an inwardly-extending portion having a downwardly curved lower face engaging the upper face of the gasket, the lower face of the ring being parallel with the curved upper face of the flange, and means extending through the ring, and gasket and engaging in the top edge of the fitting for coupling the ring and gasket to a nutting.

993,903. **EARTH-AUGER.** Grover T. Stott, New Carlisle, Ohio. Serial No. 536,373.

In an earth auger, a frame, a boring bar slidably and rotatably mounted therein, a feed screw swiveled to the boring bar, a bevel gear having a threaded opening therethrough engaged on said feed screw, means to drive the boring bar, and an operative connection between said means and said bevel gear comprising a shaft operated by said means, a bracket on said

frame provided with a portion parallel to the shaft and having a slot longitudinally thereof, a friction roller splined on the shaft and provided with a circumferential groove, a clamp mounted on the slotted portion of the bracket, an arm projecting from the clamp and provided with a forked end engaging said groove, a second shaft, a second bevel gear on the second shaft meshing with the first bevel gear, and a friction disk carried on the second shaft and against which said roller bears.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Ohio	Youngstown	June 9	Paving Hillman Street and grading Myrtle ave.	City Clerk.
Ohio	Cincinnati	June 9, noon	Improving Spring Grove avenue by setting curb, paving roadway with wood blocks or bitulithic, sides with granite blocks, constructing necessary drains and inlets.	John J. Wenner, Clk. Dept. Pub. S. Board Local Improvements.
Missouri	St. Louis	June 9, 2 p.m.	Improving portions of various streets.	P. H. Connolly, Chm. Bd. Pub. Wks.
Wisconsin	Racine	June 10, 10 a.m.	Paving por. of Water street, consisting of about 2,642 sq. yds. brick paving.	Frank Snyder, County Auditor.
Minnesota	Biwabik	June 10, 8 p.m.	Constructing about 2,000 lin. ft. curb and gutter.	Harris E. Chace, Chm. Road Com.
Oklahoma	Ft. Sill	June 10	Constructing macadam roads.	Frank Snyder, County Auditor.
Massachusetts	Freetown	June 10, 8 p.m.	Constr. a section of macadam road beginning at East Freetown Ry. station and extending as far as \$3,700 will build.	Harris E. Chace, Chm. Road Com.
Ohio	Greenville	June 10, 10 a.m.	Constr. 3 county roads in all 7,169 ft.	Frank Snyder, County Auditor.
Ohio	Sandusky	June 12, 10 a.m.	Reconstructing state road beginning at corporation line of Vermillion Village running south 1,700 feet.	John Deist, County Auditor.
New York	New York	June 12	Paving, regulating, grading, curbing, flagging, etc., in various streets of Queensboro.	Lawrence Gresser, Pres. Boro. Qns.
Ohio	Cincinnati	June 12, noon	Improving portion of Peerless st. by constructing concrete steps and all necessary appurtenances.	John J. Wenner, Clk. Dept. Pub. S. City Clerk
North Dakota	E. Grand Forks	June 12	Laying about 21,000 sq. yds. of pavement, est. cost \$61,500.	John J. Wenner, Clk. Dept. Pub. S. City Clerk
Pennsylvania	Ridgeway	June 12	Constr. 2,500 cu. yds. excavation; 7,000 sq. yds. paving and 5,600 lin. ft. curb.	F. W. Ward, Boro. Engr
New York	Albany	June 12	Constr. 9.46 miles of state roads in Otsego and Chemung Cos.	State Highway Commission.
Massachusetts	Boston	June 12	Constr. walks and drains in Boston Common.	O. H. Sullivan, Supt.
Michigan	Detroit	June 12	Furn. asphalt road oil, limestone, crushed cobble and trap rock.	H. W. Busch, Secy. Dept. Parks.
Pennsylvania	Scottsdale	June 12, 7 p.m.	Paving with vit. brick or block 6,734 sq. yds. and with vit. hillside brick or block, 1,824 sq. yds., grading, curbing, etc.	R. F. Ellis, Burgess.
Ohio	Toledo	June 13, noon	Improving Post street by paving, draining, constr. retaining walls, laying sidewalks, etc.	J. R. Cowell, Dir. Pub. Service.
Minnesota	Virginia	June 13, 8 p.m.	Paving various streets.	City Clerk.
Alabama	Montgomery	June 13, noon	Paving with brick, asphalt, bitulithic or wood block various streets, also necessary curbs, gutters and storm water drains.	Robert Tait, City Treasurer.
New Jersey	Atlantic City	June 13	Constr. Schillinger or Hexagon block sidewalks in var. streets.	Rightmire, City Engr.
Ohio	Galion	June 13, noon	Paving Massachusetts and other avenues.	Ed. C. Yochem, Clk. D. Pub. Serv.
Ohio	St. Bernard	June 14, noon	Improving North Market st. by macadamizing about 3,200 ft. and paving about 5,500 ft. in East Main st. with brick.	Geo. Schroeder, City Clerk.
Ohio	St. Bernard	June 14, noon	Constructing artificial stone sidewalks on Beech St. and Spring Grove avenue.	Geo. Schroeder, City Clerk.
New Jersey	Camden	June 14, 11 a.m.	Resurfacing the Camden and Westfield Turnpike, material to be applied by the ton, consisting of about 4,065 tons asphalt concrete, 3,677 tons 1 1/2 in. stone, 3,465 cu. yds. gravel.	J. J. Albertson, County Auditor.
New Jersey	Paterson	June 14, 2 p.m.	Improving Midvale Greenwood Lake road by macadamizing, 2,000 ft. granite curbing, all necessary storm drains, inlets etc.	Wm. H. Mason, Chm. Road Com.
Alabama	Selma	June 14, noon	Laying 5,000 yds. brick paving on concrete foundation; 2,000 ft. granite curbing, all necessary storm drains, inlets etc.	Julien Smith, City Engineer.
Ohio	Canton	June 14	Paving 2 1/2 miles.	County Road Comrs.
New Jersey	Paterson	June 14	Macadamizing the Midvale Greenwood Lake road.	Wm. H. Mason, Chm. Road Comrs.
Indiana	Winamac	June 15, noon	Constructing a highway on line bet. Pulaski & Starke Counties.	Wm. E. Munchenburg, County Aud.
Tennessee	Chatanooga	June 15, 1 p.m.	Improving various streets, consisting of about 32,000 sq. yds. paving; 19,000 lin. ft. concrete curb and gutter.	E. D. Bass, Chm. Road Com.
New Jersey	Elizabeth	June 15, 8:30 p.m.	Paving various streets with brick, asphalt and trap rock, setting curbs and gutters.	N. K. Thompson, Street Comr.
Maryland	Towson	June 15	Building a section of state highway between Quarry Line & Rockland, distance about 2 miles.	E. Stanton Bosley, Secy. Co. H. C.
Ohio	Cincinnati	June 16, noon	Improving the Loveland and Madeira road; constructing culvert and approaches on Betts ave. in Springfield township.	Stanley Struble, Pres. Bd. Co. Comrs.
Ohio	Toledo	June 16, noon	Improving Kelsey ave. by paving central 30 ft. with vit. brick on concrete foundation, necessary grading, curbing, retaining walls, drainage, etc.	J. R. Cowell, Dir. Pub. Service.
Indiana	E. Germantown	June 16, 7 p.m.	Constructing cement sidewalks in various streets.	Amos E. Ehle, Town Clerk
Massachusetts	Holyoke	June 16, 2 p.m.	Furnishing paving blocks.	Oscar C. Perry, Asst. Clk. Bd. P. W.
Idaho	Pocatello	June 17, noon	Constr. macadam road between Rossfork and Gibson in Bing ham County.	J. P. Congdon, Secy. Rossford Rd. C.
New York	White Plains	June 19	Constr. a ten foot center strip of macadam asphalt in portion of Church street.	John J. Brown, Pres. Bd. Trustees.
Washington	Vancouver	June 19	Street improvements consist of paving, grading, macadamiz., etc. estimate cost \$292,780.	H. H. Lotter, City Engineer.
Indiana	Anderson	June 19	Constructing gravel roads in various townships.	Wm. T. Richards, County Auditor.
Washington	Hoquiam	June 19	Constructing the Emerson road, est. cost \$17,000.	County Commissioners.
Tennessee	Springfield	June 20, noon	Grading, ditching and macadamizing about 50 miles of public roads in Robertson County.	Jos. E. Washington, Chm. Bd. Co. C.
Ohio	Columbus	June 21	Improving various roads in Franklin Co., about 8 miles; grad. the grounds of tuberculosis camp, constr. concrete walks.	County Comrs.
New Jersey	Spotswood	June 22, 8 p.m.	Laying 2,400 ft. of concrete curbing.	Geo. W. De Voe, Boro. Clerk.
Pennsylvania	Wilkes Barre	June 22, 2 p.m.	Repairing with bituminous macadam the Kingston and Dallas Turnpike, in Kingston township.	James N. Norris, County Compt.
Ohio	Cincinnati	June 23, noon	Repairing portion of Blue Rock pike; also for oiling Colerain pike in Colerain twp. and Cleves and Bridgetown pike in Green and Miami townships.	Stanley Struble, Pres. Bd. Co. Comrs.
SEWERAGE				
Utah	Salt Lake	June 9	Constructing pipe sewers in various streets.	H. G. McMillan, Chm. Bd. Pub. Wks
Ohio	Youngstown	June 9	Constructing sewers in various streets.	City Clerk.
Kentucky	Dawson Springs	June 10 noon	Constr. sanitary and storm water sewers, consisting of about 2,640 ft. 12-in. vit. pipe sewer; 540 ft. 10-in.; 1,400 ft. 9-in.; 3,400 ft. 8-in., m.h., &c.	C. A. Niles, Mayor.
West Virginia	Huntington	June 10, 1 p.m.	Constructing sewers in various streets, size 12 to 18-in.	A. B. Maupin, City Engr.
Ontario, Can.	Steeleton	June 10, 8 p.m.	Constr. a reinforced concrete outfall sewer about 570 ft. in length and 66 inches interior diameter.	J. Robinson, Town Clerk.
New York	Fulton	June 12, 8 p.m.	Constr. 8,500 lin. ft. of 8-in. vit. pipe sewer; 4,500 lin. ft. 6-in. vit. pipe sewer; 900 lin. ft. of 10-in. vit. pipe sewer; man-holes, flush tanks, Y branches, etc.	J. A. Foster, Pres. Bd. Pub. Wks.
New York	Jamestown	June 12, 7:30 p.m.	Constr. about 30,000 lin. ft. vitrified tile sewer 30 and 24-in.	Grover E. Yerron, City Clerk.
Minnesota	Willmar	June 12	Constr. 12,316 ft. of 12 to 15-in. sanitary sewers.	J. A. Rowat, City Engineer.
Alabama	Montgomery	June 13, noon	Constr. sanitary sewer on Sayre St. and necessary inters. sewer	Robert Tait, Treasurer

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
SEWERAGE (Continued)				
Ohio	Galion	June 13, noon	Constructing about 6,000 ft. of 10 to 30-in. storm water sewers.	Ed. C. Yochem, Clk. D. Pub. Serv
Iowa	Clinton	June 13	Constructing sewers in Sewer Dist. No. 4.	R. C. Hart, City Engr.
Pennsylvania	West Chester	June 14	Constr. of outfall sewers and disposal plants.	Boro. Clerk.
New York	Binghamton	June 14, 4 p.m.	Laying vitr. pipe sewers with appurtenances and lot connections in two streets.	S. W. Murray, Clk. Bd. Cont. & Sup.
New York	Troy	June 15	Constr. about 250 ft. of 12-in. vit. pipe sewers.	James M. Riley, Secy. Bd. C. & S.
Ohio	Piqua	June 16, noon	Constructing a sanitary sewer in South Main street.	T. D. McClay, Dir. Pub. Service.
California	Oakland	June 17, 11 a.m.	Constructing main sewers together with lateral sewers in Sewer Districts 1, 2, 3 and 4.	Jas. W. Nelson, Secy. Bd. Pub. Wks.
Minnesota	Brainerd	June 19	Constructing a general sewer.	V. N. Roderick, City Clerk.
Georgia	Tolocco	June 20	Constructing a sewerage system.	D. E. Hogsed, Chm. Sewerage Com.
South Dakota	Madison	June 20	Installing a sewer. Estimated cost \$65,000.	Chas. A. Trimmer, City Engr.
South Dakota	Aberdeen	June 26	Constr. about 1,860 ft. of 18 and 8-in. pipe sew. and 5 manholes.	F. W. Raymond, Cit y Auditor.
North Carolina	Red Springs	June 27, 3 p.m.	Constr. a sewer system including 4½ miles of 8 to 15-inch pipe.	A. B. Pearsall, Chm. Bd. Pub. Wks.
Maryland	Baltimore	June 28	Constr. storm water sewers in the bed of Jones' Falls, preliminary to constructing boulevard over Falls.	J. H. Preston, Mayor.
California	San Jose	July 3	Construct septic tank for County hospital.	City Clerk.
WATER SUPPLY				
Michigan	Marquette	June 9	Constr. an extension to the water works intake, consisting of about 2,230 ft. of 36-in. c. i. pipe with all appurtenances, riprap, dredging, etc.	J. P. Kern, Secy. Bd. Fire & W. C.
Wyoming	Upton	June 9	Constructing system of water works.	Geo. H. Davis, Town Clerk.
Indiana	Marion	June 9	Laying water mains in portion of D street.	City Clerk.
New York	White Plains	June 9	Furn. c. i. pipe for water mains; excavating 2,000 feet.	City Clerk.
Louisiana	Rayne	June 10	Furnishing 4, 6 and 8-inch cast iron pipe, gate valves, hydrants, etc., 5,000 lbs. of pig lead, and 300 lbs. of tarred hemp.	J. D. Hunter, Mayor.
Indiana	Richmond	June 12, 10 a.m.	Furnishing water to city for period of 25 years.	H. M. Hammond, Chm. Bd. Pub. W.
Montana	Lewiston	June 12	Trench and lay. 56,000 ft. of 4 to 12-in. water mains.	Phil. A. Chase, City Clerk.
Minnesota	Willmar	June 12	Constr. 2 purification plants and pumping stations.	J. A. Rowat, City Engr.
Michigan	Detroit	June 13	Furn. seven 72-in. gate valves, seven motor-operated floor stands and 9 hand-operated floor stands.	B. F. Guiney, Secy. Bd. Wt. Comrs.
Virginia	Richmond	June 14, 4 p.m.	Furn. 2 centrifugal pumps, piping and water meters; also two 200 H. P. electric motors, switches and wiring.	E. E. Davis, Supt. Water Dept.
Massachusetts	Williamsburg	June 15	Constr. a rubble masonry dam, 425 ft. long 40 ft. high with 2 spillways each 60 ft. long.	City Clerk.
North Carolina	Tarboro	June 15, 3 p.m.	Improving water works consisting of 500,000 gallon concrete filter plant 260,000 gallon concrete storage reservoir, auxiliary electric pumping station and 1 mile of 10 inch cast iron pipe.	W. O. Howard, Mayor.
Colorado	Colorado Spgs	June 16, 10 a.m.	Furn. and laying 63,785 ft. of cast iron pipe 4 to 16-in. and 43 tons special castings; alternate bids for 12 and 16-in. steel pipe; 143 gate valves and boxes; 53 tons pig lead, manh., etc.	H. F. Avory, Mayor.
Indiana	Evansville	June 17, 10 a.m.	Furnishing about 250 tons of c. i. pipe and spec. valves, meters.	Henry L. Heilman, Secy. Bd. W. C.
Ontario, Can.	Toronto	June 20, noon	Laying about 3,500 ft. of riveted steel pipe 6-in. in diameter in Lake Ontario.	F. S. Spence, Chm. Bd. Control.
Alabama	Gadsden	June 21	Furn. about 900 tons of water main, 20 tons of specials, 20 tons of lead, 30 valves and 26 hydrants.	M. E. Jones, Supt.
Quebec, Can.	Montreal	June 29, noon	Installing pumping machinery, blower and cranes at filtration plant.	L. N. Senecal, Secy. Bd. Comrs.
Minnesota	Minneapolis	June 30	Furnishing filter equipment and devices.	Henry N. Knott, City Clerk.
BRIDGES				
Wisconsin	Milwaukee	June 10	Constr. a bascule bridge across the Mil. river at foot of Oneida st.	H. E. Briggs, Comr. Pub. Wks.
Indiana	Indianapolis	June 12, 10 a.m.	Constr. a bridge over Fall Creek, on Capitol ave.	Albert Sahm, County Auditor.
Indiana	Scottsburg	June 13, 1 p.m.	Constr. two iron bridges and four concrete bridges.	Robt. Blunt, County Auditor.
California	Eureka	June 13, 2 p.m.	Constr. a pile trestle and fill on the road from the new Eel River bridge to Ferndale.	Geo. W. Cousin, Clk. Bd. Super.
Delaware	Wilmington	June 13, noon	Constr. a new reinforced concrete arch bridge over White Clay Creek at Roseville Mill, removing old bridge, furn. temporary bridge, constr. all retaining walls, etc.	James Wilson, County Engr.
Kansas	Leavenworth	June 14, noon	Repairing concrete culvert on Wyandotte and Leavenworth County line, also repairing Harms Bridge in Kickapoo twp.	J. A. Hall, County Clerk.
Manitoba, Can.	Wheatland	June 15	Constr. a bridge across the Saskatchewan river, near Rivers, to have 90-ft. steel span, 160 ft. roadway, steel stringers, masonry abutments.	Jas. R. Shanks, Chm. Bridge Com.
Washington	Ritzville	June 16	Constr. a 2-span steel bridge across Palouse River.	County Commissioners.
Ohio	Lima	June 20	Constructing a concrete arch bridge.	Bd. County Comrs.
Pennsylvania	Kutztown	June 20, 10 a.m.	Constr. a reinforced concrete arch bridge.	A. L. Rhoades, County Comptroller.
Iowa	Eldora	June 22	Constr. a 7-span steel bridge 30 ft. wide with concrete floor over Iowa River, at Iowa Falls.	E. L. Marriage, County Auditor.
Ohio	Cincinnati	June 23, noon	Constr. bridges, culverts and approaches on County Club road in Sycamore, Silverton and Columbia townships.	Stanley Struble, Pres. Bd. Co. Comrs.
Virginia	Rocky Mount	June 24	Constr. two bridges in Franklin County, of iron.	J. H. Ferguson, Chm. Bridge Com.
Texas	Houston	July 1	Constr. a reinforced concrete viaduct over Houston ship channel about 1,650 ft. long and 60 ft. wide.	F. L. Dormant, City Engr.
Pennsylvania	Pittsburg	July 1	Constructing one concrete arch, estimated cost \$85,000.	City Clerk.
LIGHTING AND POWER				
Minnesota	Eveleth	June 9	Installing 5 electric light standards.	City Clerk.
Virginia	Barton Heights	June 9	Installing a municipal gas plant.	Town Clerk.
Georgia	Colquitt	June 10	Improving electric light system to cost \$7,500.	P. E. Willin, Mayor.
Mississippi	Tupelo	June 10, 2 p.m.	Furn. 2 engines, two 250 KUA generators and accessories; 125 tungsten lights; 15 metallic flame lights; 60 H.P. induction motor; transformers, switchboard, etc.	D. W. Robins, Mayor.
Maryland	Fort Howard	June 12, 11:30 a.m.	Constructing electric light plant and lighting system.	T. A. Terry, Constr. O.M., U.S.A.
Sask., Can.	Prince Albert	June 26	Furn. hydraulic power and electrical power equipment.	C. O. Davidson, Secy.-Treas.
Arkansas	England	July 1	Building and operating an electric light plant under a 30-year franchise.	H. Galloway, Recorder.
FIRE EQUIPMENT				
New Jersey	Westfield	June 12, 8 p.m.	Furn. 1 comb. chem. engine and hose wagon; 1 pumping engine, capacity 700 gals. per minute.	R. F. Hohenstein, Chm. Fire Com.
Oregon	Portland	June 15	Furn. two 1-ton auto trucks with solid tires for Fire Dept.	City Auditor.
Dist. of Col.	Washington	June 15, 2 p.m.	Furn. one second size, double action steam fire engine.	Cuno H. Rudolph, Commissioner.
Dist. of Col.	Washington	June 20, 2 p.m.	Furn. 15,000 ft. 2½-in. cotton covered rub. lined fire hose.	Cuno H. Rudolph, Commissioner.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Updike, Chm. F. & W. Com.
MISCELLANEOUS				
New York	New York	June 9, 2:30 p.m.	Repairing steamer "The Lowell"	Michael J. Drummond, Comr. D.P.C.
Texas	San Antonio	June 12, 10 a.m.	Remodeling the county jail, est. cost about \$50,000.	County Commissioners.
New York	Buffalo	June 13, 11 a.m.	Constructing steel and brick superstructures on Intake Pier; and two internally fired tubular boilers.	Francis G. Ward, Comr. City Clerk.
Rhode Island	Providence	June 14, 2:15 p.m.	Constructing tuberculosis ward at City Hospital.	W. H. Evans, County Comr.
Arkansas	Benton	June 16	Erecting jail; separate bids for cell work.	
Indiana	Evansville	June 19, 7 p.m.	Constr. earth work embankments surrounding filtration plant consisting of about 2,500 cu. yds.	Henry L. Heilman, Secy. Bd. W. C.
Ohio	Toledo	June 20, noon	Constructing a market house.	J. R. Cowell, Director Public Service.
Indiana	Indianapolis	June 21	Collecting and disposing of garbage.	Edw. A. Ramsay, City Clerk.
Indiana	South Bend	June 26, 10 a.m.	Furn. 50 or more voting machines.	John W. Harbou, Auditor.
Ohio	Maumee	June 26, noon	Erecting a village hall building.	Geo. V. Raab, Village Clerk.
Indiana	Muncie	July 5	Constructing a new barn at County Infirmary, 40x50 ft.	County Auditor.

STREET IMPROVEMENTS

Nashville, Ark.—City has decided to construct sidewalks.

Phoenix, Ariz.—Council is considering paving of large number of streets.—O. H. Christy, Superintendent of Streets.

Connolly, St. Paul, \$18,887; Omaha nstruction Co., Omaha, Neb., \$19,650; storet-Lawrence Co., Duluth, \$15,567; bs and drainage, Albert Lea Constructuon Co., \$66,567.

uluth, Minn.—To E. A. Dahl for saniry sewer on East Superior st., \$3,316.

ilbert, Minn.—Building sanitary sewers. Pastoret & Lawrence, Duluth, \$25,008.62; ing 14,510 lin. ft., 8-in., 5,279 ft., 10-in., 2,497 ft., 12-in. vit. pipe, 24c., 28c. and ; 12,000 cu. yds. excavation, 60c.; 4 manholes, below 6 ft., \$20; 35 over 6 ft., \$30; 8 h tanks, including flushing appliance, 29 lampholes, \$5; extra for 15 drop holes, \$5; filter plant settling tank, 25 diam., 16 ft. deep, concrete; percolating r, 54 x 100, conc. bed, 6 ft. depth shed rock; sludge bed, 20 x 30, 7 manholes, 730 ft., 12-in. pipe, 1800 cu. yds. exation and 1,300 cu. yds. crushed rock, 35; other bidders: W. E. Kern, West luth, \$35,668 and \$11,080; J. H. Dahl, luth, \$29,739 and \$10,436; J. D. O'Connell; C. Butler, Virginia, \$28,496 and \$9,717; H. Bartlett Company, Virginia, \$29,739 \$10,436; Johnson & Equist, Superior, 945 and \$8,647; Harding & Co., Racine,

\$29,831 and \$11,730. Kircher & Johnson, Gilbert \$26,457 and \$8,036.

Hastings, Neb.—To A. J. Van Avery, for construction of sewer laterals in districts 58, 59 and 60.

Binghamton, N. Y.—Building sewers: Main st., to George Serfina, \$99,10; Moeller st., to George Serfina, \$1,299.96; Bennett ave., to George Pignatello, \$1,660.90; Seminary ave., to Michael Barber, \$1,581.18; Vine st., to George Serfina, \$733.72; Schubert st., to George Pignatello, \$247.10; Highland ave., to George Pignatello, \$1,441.33.

Schenectady, N. Y.—Laying sanitary sewers in Baker ave., to Kautaux-Frank Co., about \$19,000.

Muskogee, Okla.—To E. P. McCormick, for building monolithic concrete sewers, \$136,621.95; to Nelson Bros., Parsons, Kan., for brick work, \$106,311.11.

Erwin, Tenn.—To R. L. Ebevins, Bristol, to build system of trunk sewers, to cost \$20,000.

Texarkana, Tex.—Installing sewers in the recently organized district No. 10, to Ockander Brothers by Commissioners of the District, J. F. Huddleston, J. H. Moffett and J. E. Conder, \$11,997.81; other bids: M. J. Nash, \$12,190; W. A. Hanna, \$12,840; J. R. Edmonds, \$12,375; two combination bids, one of \$10,191.75, submitted by Almeter & Parker, and another of \$8,640.15, submitted by Arkansas Sewer Company, were not considered by Board.

Seattle, Wash.—To Olson Construction Co., Seattle, for constructing Interbay district north trunk sewer for \$925,781; will be circular concrete sewer.

Owen Sound, Ont., Can.—To John Cross, to supply the pipe for sewer work now being done, \$1,560.—R. McDowall, Town Engineer.

Ottawa, Ont., Can.—Construction of the west end drainage scheme, to Thos. McLaughlin, \$209,158.

BIDS RECEIVED

San Diego, Cal.—Furnishing portion of pipe and fittings for the construction of municipal sewer system: Pacific Sewer Pipe Co., \$31,512; Western Metal Supply Co., \$33,396; J. S. Schirm, \$33,504; W. J. Bailey, \$33,513; A. H. Burch Co., \$33,575. The Glazed Cement Pipe Co., of San Diego, bid \$26,618 for furnishing cement pipe, but bid was rejected.

Huron, S. D.—Building sewers: Jones & Roderick, Sioux Falls, \$8,397.30; H. J. Cathroe, Omaha, Neb., \$8,178.11; Fraser & Donforth, Rochester, Minn., \$8,946.60; E. L. Dimick, Loure, Neb., \$8,841.12.

Amherst, O.—Lowest bidder for sewer system, P. S. Construction Co., Columbus; for sewage disposal plant, F. Kemick, Bellefontaine; total cost about \$26,000.

Portland, Ore.—Lowest bidders for constructing sewers: For northern portion of Alameda Park, Alameda Land Co., \$20,584, and Irvington Heights extension of E. 17th st. sewer, Lundstrom & Sandberg, \$13,878; also, McAleary bld. division of the King's Heights sewer, Lundstrom & Sandberg, \$13,721.

North Toronto, Ont., Can.—Building three sections of sewage installations: (a) work from southerly limits of town to Eglinton ave.; (b) from Eglinton ave. north to Victoria crescent and Glenwood ave.; (c) north from Glenwood ave. to town limits: (a), Davisville; George Crowe & Son, Trenton, \$87,000; Campbell & Latimer, Port Hope, \$106,108; John E. Connolly, Toronto, \$107,846; Thos. R. Allison & Co., Toronto, \$108,012.80; Ryan & Reilly, Philadelphia, \$118,360; (b), Eglinton; E. F. Fry, Toronto, \$53,570.80; John P. Connolly, \$63,852; the J. H. McKnight Construction Co., Ltd., \$67,628.66; Thos. R. Allison & Co., \$71,897.80; (c), Bedford Park; James Reid & Co., Brantford, \$56,157; the McKnight Construction Co., \$62,825; Lorenzo & Marshall, Dunnyville, \$65,780; Thos. R. Allison & Co., \$79,787.

WATER SUPPLY

Greensboro, Ala.—Geo. Findlay, manager of Greensboro Water and Light Co., desires addresses of manufacturers of wood tanks, capacity about 8,000 gals.

Booneville, Ark.—Booneville Oil and Gas Co. is considering sinking of artesian well and gas well.—S. J. Lowell, President.

Mena, Ark.—Winters & Dove, 810 First National Bank Bldg., Ft. Smith, have completed plans and specifications for distribution system for Water Works District No. 2; separate bids will be received for material and the construction as follows: For 750 ton c.-i. pipe and special castings, 71, 4 to 12-in. valves and 27 hydrants, and for laying approximately 40,000 ft. of 1 to 12-in. mains.

Chino, Cal.—Bids will be received until June 20 for the purchase of \$10,000 bonds for the construction of water works.—A.

L. Sonderegger, 635 Central Bldg., Los Angeles, Engineer; H. E. Griffith, City Clerk.

Morgan Hill, Cal.—Citizens have voted bonds to install water works system.

Bridgeville, Del.—Council has appointed a committee to secure meters for every water spigot in town.

Bradentown, Fla.—Citizens have voted \$15,000 bonds to improve water works system and make other improvements.

Washington, Ga.—Council is considering \$5,000 bond issue to install filter at pumping station.

Chicago, Ill.—Board of Local Improvements will soon let contract for constructing water mains on number of streets.—Chas. V. Standish, Secretary.

Lostant, Ill.—Hugh M. Price, Hartford Bldg., Chicago, is preparing plans for proposed water works.

North Judson, Ind.—G. C. Morgan, Consulting Engineer, 160 Washington bldv., Chicago, Ill., is preparing plans for installation of system of water works.

Porter, Ind.—G. C. Morgan, Consulting Engineer, 160 Washington bldv., Chicago, Ill., is preparing plans for installation of water works.

Rushville, Ind.—Council has decided to dig more wells.

Shreveport, La.—National Board of Fire Underwriters has recommended installation of additional high-lift pump of at least 6,000,000-gal. capacity, additional boilers of 150 hp. and installation of additional mains.

Mars Hill, Me.—Chas. N. Taylor, of Wellesley, Mass., has been selected to design and construct water works for the Mars Hill and Blaine Water Co.; work will include about five miles of 8-in. and two miles of 6-in. pipe, with 30 hydrants and a concrete dam; material yet to be purchased.

Baltimore, Md.—Water Board has approved modified specifications for installation of pump at Mount Royal pumping station.

Rising Sun, Md.—Town Commissioners are considering construction of artesian well and standpipe.

Deerfield, Mass.—The Deerfield Fire District has voted to spend \$30,000 for water works and fire protection; concrete covered reservoir is to be built and five miles of 6 and 8-in. mains laid.—William S. Johnson, 101 Tremont st., Boston, Engineer.

Lynn, Mass.—Plans for pumping station at Montrose, to be erected for Water Department, are being prepared by Assistant Superintendent of Buildings Chas. R. Hunt.

Salem, Mass.—Plans have been completed by George P. Ashton, City Engineer, for installation of high-pressure, salt-water system for fire protection; plans include 10,000 ft. of 16-in. pipe laid in the streets and 2,000 ft. in the harbor; and fire pumps of 5,000 gal. per min. capacity, at a pressure of 200 lbs.

Benton Harbor, Mich.—Citizens will vote June 14 on \$50,000 water bonds.

Grand Rapids, Mich.—Need of better water pressure is being urged.

Wayzata, Minn.—W. D. Lovell, Consulting Engineer, Minneapolis, is preparing estimates of cost for installation of water works system and light plant.

Milan, Mo.—Citizens have voted to construct water works.

St. Charles, Mo.—Citizens have voted \$30,000 bonds for water works improvement.—J. N. Olson, Mayor.

St. Louis, Mo.—Board of Local Improvements has rejected all bids for post fire plugs, as Excelsior Tool and Machine Co., East St. Louis, Ill., lowest bidder, \$29,243.75, did not enclose certified check.

Hackensack, N. J.—National Board of Fire Underwriters has recommended installation of additional hydrants and water mains.

Kenilworth, N. J.—Borough is considering election on establishment of water plant.

Oradell, N. J.—Hackensack Water Co. will erect concrete dam across Hackensack River; cost, \$50,000.

Middleport, N. Y.—Village is considering installation of water plant.

Salem, N. Y.—Village Trustees have granted Frank A. Hill a franchise for a system of water works; water supply will be taken from Scotts' Lake, about 2 1/2 miles from village.

Cincinnati, O.—Plans and specifications are being prepared for installation of water tanks at Mount Auburn. Address Water Works Superintendent Laidlaw.

Plymouth, O.—Council is considering installation of filtration plant.—R. H. Mann, City Clerk.

Union, Ore.—Council is considering repair and extension of water system.

Glasgow, Pa.—Town is considering construction of water works system.—Henry Camp, President Council.

Somerset, Pa.—Council will issue \$15,000 bonds to equip water plant on site of new wells.

Lewisburg, Tenn.—G. C. Morgan, Consulting Engineer, 160 Washington bld., Chicago, Ill., is preparing plans for installation of system of water works.

Galveston, Tex.—Bids will be asked by City Superintendent of Electricity W. D. Masterson for installation of Corliss high-efficiency flywheel type pump with cap. of 4,000,000 gal. per day.

Olney, Tex.—Citizens have voted \$12,500 bonds for installation of water works.

Paris, Tex.—Council is considering increasing of water supply.

Rogers, Tex.—Bids will be received July 1 for \$14,000 water bonds to lay pipe line from Lake Leathrick to Little River.

Weston, Tex.—Bids are wanted by A. E. Ragsdale for deep well.

Neenah, Wis.—J. F. Icke, Engineer Madison Water Works, has made report on condition of Neenah system and recommended that pump and meters be installed and well dug.

Cardston, Alta., Can.—Citizens are considering installation of gravity water works system.

Southampton, Ont., Can.—Citizens have voted to expend \$7,500 to extend water works system.

Wilkie, Sask., Can.—Installation of water works system is being considered.

CONTRACTS AWARDED

Fort Baker, Cal.—Erecting 100,000-gal. steel water storage tank to Braun, Williams & Russell, Inc., 503 Market st., San Francisco.

Presque Isle, Me.—By Presque Isle Water Co., which is to lay about five miles of 6, 8, 12 and 14-in. c.-i. water pipe, build concrete core dam and a 1,000,000-gal. reservoir, to Chas. N. Taylor, Contracting Engineer, Wellesley, Mass., for the engineering and construction necessary; to the Standard Cast Iron Pipe and Foundry Co., to furnish the pipe; to Chapman Valve Co., valves; to R. D. Wood & Co., hydrants; to Freeman & Co., Presque Isle, cement; and to Builders' Iron Foundry, special castings.

Boston, Mass.—To Raffale Cartullo for laying water pipes in Arlington st. and other streets, \$2,369; other bidders: A. M. Cusack, \$2,477.50; Thomas Burke, \$2,572.50; Daniel E. Lynch, \$3,280; Charles J. Jacobs Co., \$3,424; Michael Russo, \$3,137.50; Hugh McNulty, \$2,543.50; R. J. Young & Co., \$2,555.50; R. P. Cushing, \$3,192.50; J. A. Costello & Co., \$2,897.50; Peter W. Hill, \$3,610; Charles M. Callahan, \$2,595; F. H. Cowin Co., \$2,651; M. De Sisto & Co., \$2,517; William J. Rafferty Co., \$3,191.50; A. De Stefano, \$2,932.50; Engineer's estimate, \$2,800.

North Mankato, Minn.—Construction of water works; two reservoirs and pump house, to J. B. Nelsen Construction Co., \$4,335; well, to Sioux City Well Co., \$3 per ft.; pipe line, valves, hydrants and sewer drain, to Pastoret-Lawrence Co., Two Harbors, Minn., 6-in., 76c., 8-in., \$1.25; 10-in., \$1.55.

Columbia, Mo.—To John W. Danforth Co., Buffalo, N. Y., for extensions to the municipal water and light plant, \$66,000.

Perth Amboy, N. J.—To the Merritt & Chapman Derrick and Wrecking Co., to lay additional 24-in. main, about 2,000 ft. in length, under the Raritan River, \$15.93 per ft.

Cortland, N. Y.—Building 1,000,000-gal. standpipe, to Sharon Boiler Works, Sharon, Pa., \$13,000 for ingot iron.

Jamestown, N. D.—To C. H. Porritt, of Fargo, for water mains, \$10,265, and for sewers, \$6,493.

Barnesville, O.—To U. S. C. I. Pipe & Foundry Co., Rookery Bldg., Chicago, Ill., for water pipe; to W. H. Patterson & Son for laying same.

Silverton, O.—Installing system of 6-in. water mains and necessary appurtenances to M. F. Quill, \$15,123.

Toledo, O.—Furnishing and installing rotary pump of 15,000,000 gals. daily capacity, gas producer and accessories of approximately 400 hp. continuous capacity, to Rathbun-Jones Co., of Toledo.

Vian, Okla.—Construction of water works from plans of E. W. Gantt, Kennedy Bldg., Ft. Smith, Ark., to the Healy Construction Co., of McAlester; total \$18,303, including tower and tank, pump pipe, buildings, etc.; 5,600 ft. 6-in. c.-i. pipe, 64c.; 1,150 ft. 8-in. c.-i. pipe, 85c.; 8,840 ft. 4-in. c.-i. pipe, 98c.; 8,700 ft. 2-in. w. galv., 3 1/2c.

Tacoma, Wash.—To P. E. McHugh for construction of the pipe line of Green River gravity water system from the McMillan reservoir to the city by Municipal Commission, \$102,609.80.

Harrison, Ont., Can.—Water works, to Gartsch-Thomson, P. & F. Co., Hamilton, for c.-i. pipe; to Kerr Engine Co., Walkerville, for hydrants and valves; to Hunter Bridge & Boiler Co., Kincardine, for water power; to Jas. Robertson Co., Toronto, for lead; to Geo. B. Moogk, Weston, for excavation and pipe laying; to Brown & Co., Toronto, for electrical fixtures.

Saskatoon, Sask., Can.—Installation of mechanical water filtration plant, to Roberts Filter Manufacturing Co., Philadelphia, \$55,890; other bidders: Bell Filtration Co. of Canada, Toronto, \$56,950; Pittsburgh Filter Manufacturing Co., Pittsburgh, Pa., \$58,120; New York Continental Jewell Filtration Co., New York, \$56,845; Geo. H. Archibald & Co., Winnipeg; Laurie & Lamb, Montreal, \$50,575.—Geo. T. Clark, City Engineer.

South Vancouver, B. C., Can.—Supplying hydrants to municipality, to the Terminal City Iron Works.

BIDS RECEIVED

Eveleth, Minn.—Erection of foundation and in the installation of a 2,500,000-gal. water pump; Epping-Carpenter Co., Pittsburgh, Pa., \$15,721, the city to deduct \$1,679 if it desires to make the connections itself; Fred W. Prescott Co., Milwaukee, \$12,560 for pump, \$13,710 for erection of foundation and pump, \$2,750 for installation work, \$300 for additions; Norberg Manufacturing Co., Milwaukee, Norberg engine, \$15,000; Ladell, Dun, Gordon & Co., Milwaukee, \$11,400 for pump, \$2,750 for installation.

Long Island City, L. I., N. Y.—Furnishing and laying water mains in Academy, Amity, Bragaw, Cherry, Crescent and other streets, Roswell S. Williams, lowest bidder, \$87,571, including pipe, valves, hydrants, etc.; 1,350 tons straight c.-i. pipe, \$29.50; 75 tons c.-i. special castings, \$60; 100 tons c.-i. castings, \$45; 27,500 cu. yds. earth excavation, 35c.; 3,700 lin. ft. 16-in. pipe to lay, 37c.; 6,500 lin. ft. 12-in. pipe to lay, 30c.; 38,500 lin. ft. 8-in. pipe to lay, 22c.; 2,000 lin. ft. 8-in. pipe to lay, 20c.; 32 12-in. valves to set, \$8; 160 8-in. valves to set, \$8; 150 6-in. valves to set, \$5; 50 fire hydrants, pipe drain, \$8; 75 fire hydrants, broken stone, \$8; 250 sq. yds. sheet asphalt, \$1.75; 100 sq. yds. asphalt block, \$2.50; 3,500 sq. yds. macadam pavement, 40c.; other bidders: Leo E. Kelly, \$89,182; Beaver Engineering and Construction Co., \$95,052; Franklin Contracting Co., \$99,069; Daly Bros. Co., \$87,695; Nelson & Dowling, \$78,526; R. Carter Co., \$96,035; Peace Bros., \$77,449; Wilton Construction Co., \$96,534; D. Cuzzo Co., \$89,544.

New York, N. Y.—Contract 77, for the Wakefield ave. blowoff from Hill View reservoir; T. J. and George L. Brown, 87 Hamilton pl., city, \$58,178; Keystone State Construction Co., 704-709 Penn Bldg., Philadelphia, Pa., \$63,935; King-Ganey Contracting Co., \$64,481; D. Cuzzo & Co., Park Row Bldg., city, \$65,511; Voorhees-Sullivan Construction Co., Dorothea pl., Fordham, \$69,907; Godwin Construction Co., 30 Church st., city, \$69,931; William F. Norton, 215 West 125th st., city, \$71,635; T. M. McLeod Co., 90 West st., city, \$72,859; Patrick Derry, 44 Jane st., city, \$73,121; F. N. Lewis, 263 4th ave., city, \$73,697; Silery, Nordone & Silery, Mount Vernon, N. Y., \$76,625; Phoenix Construction Co., 41 Park Row, city, \$97,764.

New Brighton, S. I., N. Y.—Laying mains in Belmont, Clarke, Henry and other streets, including valves, hydrants, etc., Jas. McAvoy, 303 E. 127th st., New York City, \$399,444; Leo E. Kelly, Brooklyn, \$332,062; Wm. F. Norton, 215 W. 125th st., New York City, \$342,694.

Galveston, Tex.—Furnishing pumps for city water works; three bids were received for installation of two centrifugal pumping units and each bidder submitted two or more propositions by reason of exchanging two turbines now used for the city electric light plant for new centrifugal pumps or allowing difference for turbines; bidders were as follows: A. M. Lockett & Co., New Orleans, \$3,275 for first proposition, \$4,250 for second proposition, \$6,100 for third and \$7,800 for fourth proposition; Randall, Lovegrove & Wyman, Houston, \$4,250 for first proposition and \$3,550 for second proposition; the Lowe Electric Co., city, \$4,317 for first proposition and \$2,517 for second proposition.

Park City, Utah.—Construction of water works plant; Lynch & Cannon Engineering Co., Salt Lake City, Utah, \$48,949; J. W. Percival, Salt Lake City, \$56,380; A. A. Clark, Salt Lake City, \$47,499 (awarded contract); McKay & Reed, Salt Lake City, \$47,800; P. J. Moran, Salt Lake City, \$57,732; Moran Construction Co., Salt Lake City, \$47,010; Wheelwright Construction Co., Ogden, Utah, \$47,144.

Ft. Myer, Va.—Water works improvements: (a) remodeling pumping station, (b) filter, (c) 2 miles of 10-in. water main from Roslyn to Ft. Myer; W. H. McCray, (a) \$2,100; Julius Wanner, (c) \$18,500; R. E. Reissau, (a) \$2,860, (c) \$21,500; General Conduit Co. (a) \$2,000, (b) \$7,200, (c) \$25,467; Jas. Nolan & Sons, (a) \$3,500, (b) \$6,375; J. W. Danforth & Co., (a) \$3,400, (b) \$5,200, (c) \$19,000; Newport Construction and Engineering Co., (a) \$3,000, (b) \$6,400, (c) \$21,775; the W. E. Burnizer Co., (c)

\$21,000; L. B. Jacobs, (c) \$17,446; F. J. Boas, (a) \$3,000, (c) \$19,280.

Tacoma, Wash.—Building final unit of Green River gravity water system; P. E. McHugh, city, lowest bidder, \$417,441; estimate was \$102,000 above that figure, being \$520,000. Other bidders: International Contract Co., of Seattle, \$489,086.50; Pacific Coast Pipe Co., of Tacoma, \$483,736.40; F. McLellan, of Seattle, \$478,944.70; Sound Construction & Engineering Co., of Tacoma, \$477,327; Butler Construction Co., of Seattle, \$466,874.70; Jahn Contracting Co., of Portland, \$463,843; Wright Contract Co., of Tacoma, \$463,736.20; N. A. Jones and A. W. Tweeden, of Tacoma, \$464,937.50; Far-West Construction Co., \$460,432.10; Dibble-Hawthorne Co., of Tacoma, \$456,920.50; Grant Smith Co., of Spokane, \$454,626.40; C. L. Morris Construction Co., of Seattle, \$449,948.90; John Galluci and R. De Rose, of Tacoma, \$436,820.50; W. B. Slick, of Boise, Idaho, \$436,251.50.

LIGHTING AND POWER

Birmingham, Ala.—People's Gas Company has been given franchise by the Birmingham Commission; company proposes to bring natural gas to Birmingham from Fayette Fields, 82 miles away.

Decatur, Ala.—Plans are being prepared by J. B. McCrary Co., Atlanta, Ga., for municipal electric light plant; cost, about \$40,000.

Kingman, Ariz.—Kingman Gas Co. has secured options on site for erection of gas plant.

Madera, Cal.—Frederick C. Roberts has been granted franchise to lay gas mains through city streets.

New Castle, Del.—Council is considering installation of electric light plant.

Washington, D. C.—District Commissioners have abandoned scheme for lighting Pennsylvania ave. by a series of ornamental posts running down center of the street and have asked Walter C. Allen, District Electrical Engineer, to submit another plan.

Washington, Ga.—City is considering improvements to electric light plant, including power plant, estimate cost \$10,700; repair outside wiring, \$8,000; install electric pump at pumping station and build transmission line to pumping station, \$6,300.

Hope, Ida.—Northern Idaho & Montana Power Co. has been granted franchise to install power and lighting service.

Sylvan Grove, Kan.—Citizens will vote June 26 on \$25,000 bonds for electric lighting and water works.

Lake Charles, La.—Council has authorized the Mayor to advertise for bids for franchise to operate a gas plant in Lake Charles, subject to the charter provisions and specifications for installing plant adopted by Council; franchise is to run for 20 years.

Catonsville, Md.—Baltimore County Water & Electric Co. has completed arrangements for installing new arc and incandescent lights on all streets; present lights in use at Catonsville will be transferred to Highlandtown; cost about \$5,000.

Cambridge, Mass.—Council is considering advisability of establishing municipal electric lighting plant.

Newberry, Mich.—Citizens will vote on \$11,500 bonds to improve power plant.

Braham, Minn.—Village Council has granted franchise to Eastern Minnesota Power Co. to install electric light plant.

St. Paul, Minn.—Specifications are being prepared and bids will be asked at once for lighting streets of city.

Wayzata, Minn.—Consulting Engineer W. D. Lovell, Minneapolis, is preparing estimates of cost of installing light plant and water works system.

Butte, Mont.—Council has authorized the extension of curb cluster lighting system at estimated cost of \$12,000.

Libby, Mont.—Libby Water Works, Electric Light and Power Co. will soon install electric light plant.

Sheridan, Mont.—Madison Power Co., of Butte, is planning to supply electric light for this town, Alder and Laurin.

Mason, Nev.—H. W. Culbertson, Manager of Mason Water, Light & Power Company, will at once proceed with enlarging of water supply of city; work includes building of large tank on hill above town and laying of more water mains; also means change from air pressure system to gravity system.

Wolcott, N. Y.—The Public Service Commission at Albany has authorized Northern Wayne Electric Light and Power Co. to purchase Wolcott Electric Light and Power Co. for \$33,000; company is also authorized to complete construction of a pole line for transmission of electricity from substation of the Rochester and Sodus Bay Railway Co., at Sodus, to village of Red Creek, and from village of North Rose to Cress, and construction of secondary distribution systems in the villages.

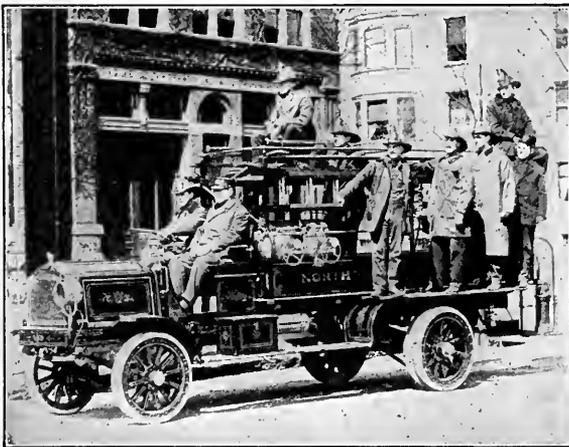

Eliminate dangerous delays by
equipping your Municipal Vehicles with

United States Tires

**CONTINENTAL
G & J**

**HARTFORD
MORGAN & WRIGHT**

It isn't the spark that makes the blaze; it's the first few minutes
delay in quenching the spark

34"x4" Single 36"x4" Dual
UNITED STATES SOLID MOTOR TIRES

Equip your fire apparatus with United States Tires, and you won't have delays from tire troubles. Because United States Tires are the **most reliable tires in the world.**

They are designed by the foremost tire experts in the rubber industry, and produced in the five best equipped tire factories in the world. Into them is built the combined strength and durability of four world-famous tires.

That is why United States Tires "get there" every time and are always "on the job."

United States Tires are furnished in nine different types of solid and pneumatic tire, and in both single and dual styles—a tire for **every** Municipal Vehicle.

*50 direct branches guarantee United States Tire service
everywhere and at all times.*

UNITED STATES TIRE CO.

Broadway at 58th Street

New York City

Comanche, Okla.—Citizens have voted bids for electric plant.

Klamath Falls, Ore.—F. W. Bordman and associates, San Francisco, have been granted a 50-year franchise for gas plant in this city; construction of the plant must be begun within 60 days and system must be in operation before expiration of eight months.

Edgefield, S. C.—City will soon receive bids for construction of electric light plant. W. H. Harling, Clerk.

Chamberlain, S. D.—Newly organized company, W. Hall Trans, president, has asked for electric light franchise; contract for lighting streets expires July 1.

Petersburg, Tenn.—Charter has been granted to Petersburg Electric Light and Power Co. to establish electric light system.—A. C. Davis, Geo. McAdams, J. A. Montgomery, J. C. Melady and O. F. Gill, Incorporators.

Terrell, Tex.—Commission will at once award contract for construction of concrete powerhouse.

Castlerock, Wash.—Carl A. McClain is interested in private company contemplating erection of power plant.

Tacoma, Wash.—Municipal Commissioners have adopted ordinance authorizing asking of bids for furnishing 10,000 lbs. of weather-proof copper wire.

Spokane, Wash.—Washington Water Power Co. will expend \$30,000 in Lincoln Heights to install electric lights; line will be run direct from main station.

Mishicot, Wis.—Ira Beyer and Peter Kowler are interested in proposed construction of dam across Mishicot River to furnish power for an electric light and power plant.

Hamilton, Ont., Can.—Dominion Power & Transmission Co. is considering construction of electric line to Galt.

Montreal, Que., Can.—The Shawinigan Water & Power Co. is planning to build another power house to develop 75,000 additional hp.—Julian C. Smith, 607 Power Bldg., Chief Engineer.

Penetanguishene, Ont., Can.—City will expend \$16,500 to purchase existing power plant and \$10,500 for extensions and improvements.

CONTRACTS AWARDED

Bakersfield, Cal.—Furnishing surface condenser for San Joaquin Light & Power Co. to Braun, Williams & Russell, Inc., 503 Market st., San Francisco.

Tustin, Cal.—To Southern California Edison Co., Los Angeles, to install and operate 110 electric lights on certain streets.

Brainerd, Minn.—Northwestern Electrical Equipment Co. to furnish the equipment for electric street lighting, \$3,080; other bidders were General Electric Co. and Electrical Appliance Co.

Altoona, Pa.—By the Penn Central Light and Power Co. for trenching and other work, to the Bell-Bockel Stone Co. and to H. G. Hinkle; work will involve expenditure of \$250,000.

Richmond, Va.—To W. H. Jenks, for erecting poles for municipal lighting system in Washington Ward, \$1,200.

Tacoma, Wash.—Furnishing \$25,000 worth of long filament lamps, to Home Electric Co.

FIRE EQUIPMENT

Little Rock, Ark.—Purchase of following apparatus has been recommended: Auto combination hose wagon, first-class steamer, chief's auto, 75-ft. self-raising aerial ladder and one reserve hose wagon.

Los Angeles, Cal.—Architects Dennis & Farwell, 301 Currier Bldg., have prepared plans for erection of annex to fire engine house at 139 North Hope st.

Golden, Col.—Equipment will soon be needed for newly formed fire department.

Freeport, Ill.—Council has decided to call election on \$20,000 bond issue to purchase apparatus and erect 85,000 hose house.

Indianapolis, Ind.—City has sold \$200,000 bonds for improving fire department to Meyer & Kiser Bank and Newton Todd.

Council Bluffs, Ia.—Purchase of auto fire truck is being considered.

Shreveport, La.—National Board of Fire Underwriters has recommended installation of 600-gal. engines for Companies 1 and 5, preferably autos; auto combination hose wagon for Company No. 5 and new auto for Chief; also minor equipment.

Bangor, Me.—Council has ordered estimate of cost of erecting fire station.

Chisholm, Minn.—Purchasing Committee of Council will purchase two additional hand chemical wagons.—Thos. O'Connor, Chief.

Joplin, Mo.—Purchase of additional auto apparatus is being urged.

Libby, Mont.—Volunteer fire company has been formed.—W. S. Maguire, Chief.

Belleville, N. J.—Fire District has defeated \$8,000 appropriation for purchase of fire auto.

Hackensack, N. J.—National Board of Fire Underwriters has recommended providing of reserve hose wagon equipped with turret nozzle and carrying 1,000 ft. of hose; also purchase of minor equipment and apparatus for fire alarm system.

Wantua, N. J.—Newly organized fire company will erect engine house.

Hazleton, Pa.—Council is considering bill providing for purchase of 1,000 ft. of hose.

Pittsburg, Pa.—Mayor Wm. A. Magee has signed ordinance for purchase of 85-ft. aerial truck, three auto propelled combination chemical and hose wagons and for erection of temporary fire house in Beechview.

Williamsport, Pa.—Special committee has recommended need of hose wagons for companies 1 and 4.

Sumter, S. C.—Fire Committee, J. F. Glenn, Chairman, will secure bids on furnishing auto engines.

CONTRACTS AWARDED

Birmingham, Ala.—Furnishing nine motor-propelled combination chemical and hose fire wagons to Seagrave Co., Columbus, O.; about \$40,000.

Grand Rapids, Mich.—Furnishing two motor-driven 60-hp. chemical engines, to Michigan Hearse and Carriage Co., \$3,500 each.

New York, N. Y.—Furnishing and delivering 3,500 ft. of 3/4-in. rubber fire hose for fire-boats, Boro Manhattan, and 1,500 ft. of 3/2 in. rubber fire hose for fire-boats Brooklyn to only bidder, B. F. Goodrich Co., New York.

Syracuse, N. Y.—Installing central office fire alarm system, to Gamewell Fire Alarm Telegraph Co., \$28,875.

Utica, N. Y.—Furnishing and installing automatic repeater and switch board for fire station, to Utica Fire Alarm Co., \$1,343.

Butler, Pa.—Erecting three-story fire station, to W. S. Brandon.

Cameron, Tex.—To W. D. Bigby for erection of fire station in this city, \$3,145.

Spokane, Wash.—Furnishing 66-hp. auto for Fire Chief Harry A. Myers, to Geo. W. Merrill, local agent for the Thomas Flyer, \$3,800.

BRIDGES

Bridgeport, Conn.—Plans are nearly completed for new Island Brook culvert to be built out of special appropriation of \$3,900; bridge will be of reinforced concrete 50 ft. long, 60 ft. wide, of high beam construction; bids will soon be invited.

Dover, Del.—Levy Court of Kent County will build modern bridge of iron with a 14-ft. wood span and 16-ft. roadway over west branch of Smyrna River.

Rockford, Ill.—Plans and specifications are being prepared for construction of 125-ft. bridge, estimated at \$1,000, over Keith Creek at 6th st.—S. B. Hand, City Engineer.

Waukegan, Ill.—City Commissioners are considering erection of bridge over ravine at Genessee st.

Clio, Ia.—Engineer Hart has prepared plans for three steel bridges to be erected in the central part of county; bids on their erection will soon be asked.

Grand Rapids, Mich.—Daniel B. Luten, Indianapolis, will draw plans for new cement bridge at Leonard st.

Albert Lea, Minn.—Plans are being prepared for 80-ft. span concrete bridge and draw.—Wm. Barneck, City Engineer.

Joplin, Mo.—Joplin Road Commissioners will construct bridge on Scotland road east of Luenweg; steel framework; concrete floor; cost \$2,500.

Far Rockaway, L. I., N. Y.—Board of Estimate, New York City, has appropriated \$35,000 for construction of bridge over Norton's Creek at Atlantic ave.

Chillicothe, O.—County Commissioners have passed resolution for issue of \$37,000 bonds for construction of bridge over Paint Creek.

Johnstown, Pa.—Plans will be prepared and bids asked for repairing Conemaugh bridge.

Pittsburg, Pa.—Mayor Wm. A. Magee has signed ordinance authorizing sale of \$30,000 bonds for erection of bridge over Hoever st.

Llano, Tex.—Plans have been adopted by Commissioners' Court of Burnet and Llano Counties for erection of Colorado River bridge; cost, \$30,000.

Brigham City, Utah.—Box Elder County has voted \$200,000 bonds to build bridges and roads.

Spokane, Wash.—Washington Water Power Co. will spend more than \$25,000 in bridge and road improvements in Spokane, Lincoln and Stearns counties this summer.

Tacoma, Wash.—Municipal Commission has decided to advertise for bids for the construction of bridges over 11th st. waterways and over Puyallup River at 11th St.

Milwaukee, Wis.—Alderman Mikkelsen, Chairman Harbor Committee, has recommended erection of aerial ferry bridge, cost \$100,000, to connect Jones Island with mainland.

CONTRACTS AWARDED

Wilmington, Del.—Building bridge over west branch of the Sinyrna River in Blackbird Hundred, to Frank R. Jones, \$5,000.

Goff, Ida.—Constructing bridge over Salmon River, to the Security Bridge Co., Lewiston, about \$15,000.

Indianapolis, Ind.—Building concrete bridge on State ave. over Pleasant Run, to R. F. Pickens, \$9,683.

Clinton, Ia.—Building concrete bridges in county to F. V. Clarke, city, \$5,388.52; other bidders: W. L. Steele, \$6,534.12; Godber Hansen, \$6,556.20; Iink & Schnell, \$6,541.05; J. R. Kane, \$6,243.35; P. C. Donahue, \$6,250.21; Clinton Bridge Co., \$8,626.55.

Louisville, Ky.—Building bridge over Salt River at West Point for Jefferson and Hardin counties, to Capital Construction Co., \$53,600.

Louisville, Ky.—To National Concrete Construction Co., Indianapolis, for construction of two bridges over Beargrass Creek, \$11,510; other bidders were L. R. Figg & Co., \$14,447.45; the Henry Bickel Co., \$13,939.08; the L. W. Hancock Co., \$12,936.48; and H. H. Snyder, \$11,815.60.

Springfield, Mo.—Constructing concrete culvert, 222 ft. long and 12 ft. wide to A. H. Rountree, \$5.25 per cu. yd.

Ripley, Tenn.—Building eight county bridges to Jollet Bridge & Iron Co., Jollet, Ill., \$4,800.

Fort Worth, Tex.—By County Commissioners for 60-ft. concrete bridge over Marine Creek at 13th st., on the north side, to Dennis Fagan, approximately \$8,000.

Moab, Utah.—Constructing bridge over Grand River to the Midland Bridge Co., Gibraltar Bldg., Kansas City, Mo., \$43,000; other bidders were: Monarch Engineering Co., \$48,000; Patterson-Burghardt Construction Co., \$47,000; Chas. G. Sheehy, \$46,577; Empire Bridge Co., \$47,800; Central States Bridge Co., \$47,000; A. M. Blodgett Construction Co., \$46,925.

MISCELLANEOUS

Modesto, Cal.—Plans by Architect W. H. Weeks, San Francisco, have been accepted for erection of \$25,000 library.

Indianapolis, Ind.—City has sold \$110,000 city hospital bonds to syndicate composed of Fletcher American National Bank, Joseph T. Elliott & Sons, Gavin L. Payne & Co., Reed, Harrison, Miller & Adams.

Davenport, Ia.—City will spend about \$250,000 during next few years in improving river front; islands, including a fill, will make 120 acres of valuable ground; Mayor Alfred C. Mueller has named W. D. Peterson, business man; Rudolph B. Clausen, architect, and Wm. H. Kimball, civil engineer, as River Front Improvement Commission, who, with the Mayor and Commissioner of Public Works, A. M. Compton, will have full charge.

Boston, Mass.—Council has passed \$25,000 loan order for branch library in North End.

Boston, Mass.—Bids will be readvertised by Commissioner Rourke for erection of proposed ferry boat.

Groveland, Mass.—Town is to have modern playground for children; \$1,200 available.—Rev. Andrew Campbell, Chairman Committee.

Crystal Falls, Mich.—Council has decided to erect city hall and opera house; site purchased.

Chisholm, Minn.—Site will soon be purchased for erection of proposed \$25,000 Carnegie library. Prof. J. P. Vaughn is interested.

Duluth, Minn.—Douglas County Board will erect \$8,000 sanitarium at Parkland.

Fulton, Mo.—City will erect \$12,000 Carnegie library.

Brooklyn, N. Y.—Plans are being prepared for erection of disposal plants at Rockaway Beach and Ridgewood; for the former cost is estimated as follows: Incinerator, 50 tons, \$1,000 per ton; land, \$16,000; stable and 32 horses, \$25,000; section house, \$10,000; for latter: Land, \$30,000; incinerator, 100 tons, \$100,000; stable and 50 horses, \$10,000; station house, \$32,000.—A. C. Hankins, Commissioner of Street Cleaning.

Chatham, N. Y.—Municipal building, cost \$25,000, will be erected on Central Square.—Wm. H. Houseman, President Board of Trustees.

New York, N. Y.—Park Commissioner Stover will spend \$250,000 before end of the summer for development of playgrounds.

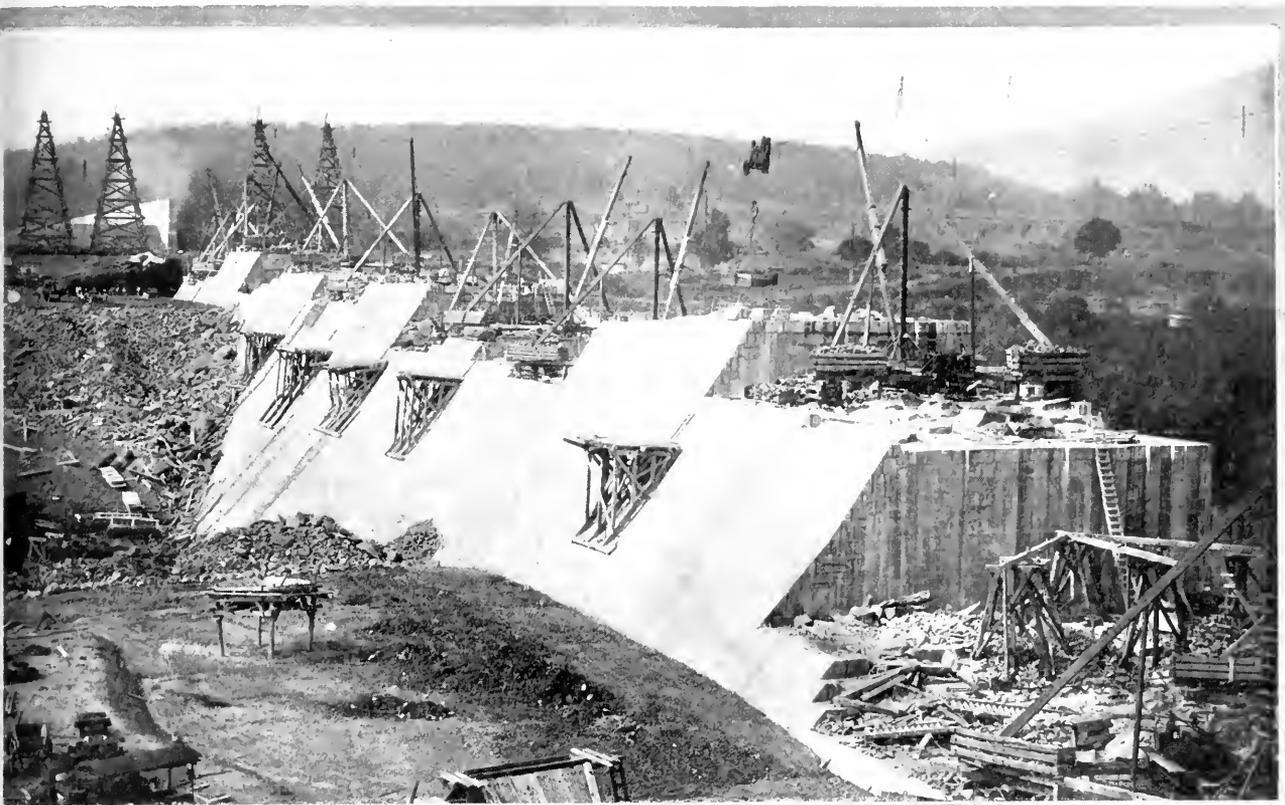

Rochester, N. Y.—Board of Contract and Supply has authorized \$20,000 expenditure for purchase and equipment of playground on Front st.

No. 24

GENERAL VIEW OF OLIVE BRIDGE DAM UNDER CONSTRUCTION

CATSKILL WATER SUPPLY

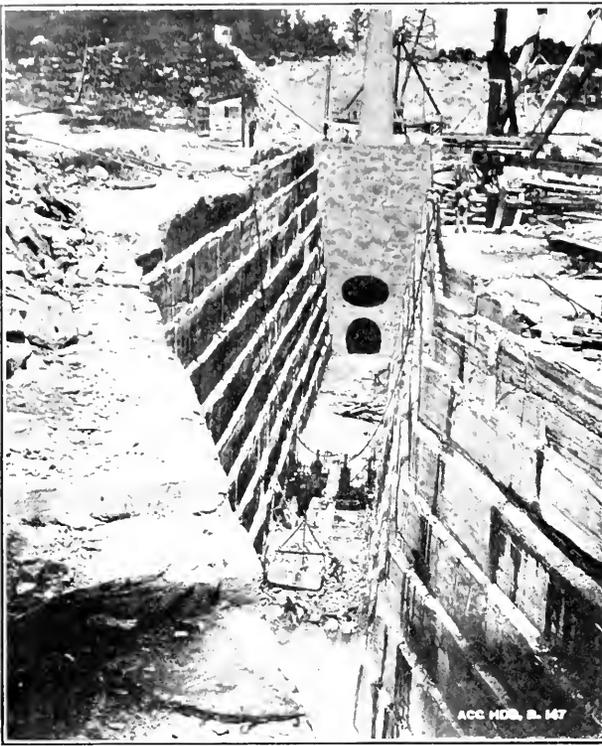

Progress Made to Date on Ashokan Reservoir and Aqueduct—Masonry Dam Will Be Completed This Year
—Expansion Joints—Tunneling Under the Hudson—Mud Seams and Caves—Handling Seepage

In our issue of January 19, 1910, we gave a general description of the new water supply for greater New York which is under construction and has for its aim the bringing to New York City of water from the Catskill watersheds 100 miles away. Work was continued during the year of 1910 even more rapidly than was called for by the contract, and, although to a considerable extent intermitted during the winter, has been under full way for several weeks.

It may be interesting to review concisely the general fea-

tures of this project, and especially of the Olive bridge dam and the Ashokan reservoir. This reservoir is the only one which it is intended to build at present, although the complete plans include the development of three other watersheds.

The reservoir is formed by the impounding of the Esopus Creek by the Olive bridge dam and several dikes. Two branches of the creek meet near the dam, and a dike about 1,100 feet long at this point divides the reservoir into two basins. The west basin has an area of 5 square miles and

PRESSURE AQUEDUCTS UNDER DIVIDING WEIR AND UPPER GATE HOUSE, ASHOKAN RESERVOIR

Built of Concrete in Rock Trench, Instead of by Tunnelling.

available storage capacity of 47,000 million gallons; the east basin has an area of 7.8 square miles and available storage capacity of 80,000 million gallons. The maximum width of the reservoir is 2.6 miles and the average width 1.1 miles. The average depth is 50 feet. The water surface in the west basin has an elevation of 590 feet above mean high tide at Sandy Hook and that of the east basin 587 feet; the dike between the east and west basins serving as a weir over which the water passes from the west to the east. The Olive bridge dam will have a total length of 4,620 feet, 1,000 feet of this being masonry. The top of the masonry dam is at elevation 610, 210 feet above the elevation of the original creek bed and 252 feet above the lowest point in the cut-off trench. The maximum width of the masonry dam at the base is 200 feet and the maximum width of the earth portion of the dam is 780 feet. In addition to the dam there are dikes having a total length of about 3 miles, a maximum height of 110 feet and a maximum width of 640 feet at the base.

Before flooding the reservoir it will be necessary to discontinue and rebuild 13 miles of track of the Ulster and Delaware Railroad. Sixty-eight miles of highways will be discontinued and 38 miles rebuilt. Seven villages will be drowned out, having a winter population of 1,900 and a summer population of about 3,000. It will also be necessary to move 35 cemeteries, most of them private, containing 2,800 bodies.

As soon as the dam is completed it will be possible to begin storing water in the reservoir, and to supply it to New York City as soon as the aqueduct is completed. Work on these has been hastened as much as seemed consistent with good construction, and it is confidently expected that the masonry dam will be completed this year, and that water will be delivered to New York City from this supply before the end of 1912. Of the 550,000 cubic yards of masonry in the dam 75 or 80 per cent. has been completed, and practically all of the face blocks have been constructed and are seasoning in the yard. The south end of the dam is practically finished and the general average of the entire dam is probably about 30 feet below its completed elevation.

The dam is constructed of concrete laid in place and con-

taining numerous boulders; molded concrete blocks being used for the upper and lower face, for one face of each expansion joint, and for the blocks around the well holes and galleries. These face blocks are molded in a yard near the work and allowed to season for at least three months before use. These are laid in advance of and kept a little higher than the mass concrete. Up to the present time about 27 per cent. of the mass concrete has been composed of boulders, which are thoroughly imbedded in the concrete and uniformly distributed.

At intervals of 84 feet there are expansion joints extending completely through the dam and from the crest to a little below the surface of the ground, every alternate joint extending entirely to rock. One face of each expansion joint is built of concrete blocks, the surface well covered with crude petroleum and the concrete of the adjoining section placed in bulk against this. In the face built of blocks are left a number of rectangular recesses having an area of about 10 by 20 feet, distributed so as to occupy possibly one-fourth of the area of the joint, with slightly beveled edges, for the purpose of bonding the two sections together. At each expansion joint there is a well hole about 12 feet in from the upper face of the dam, and 6 by 8 feet in section, extending from the level of the water surface to about elevation 440, or 170 feet below the crest and a few feet below the general surface of the ground. At the upper and lower ends of these well holes is a gallery which extends the entire length of the masonry dam, the lower one serving to receive any leakage which may enter the expansion joints and be intercepted by the well holes. The lower gallery has a slight slope from each end toward the center, at which point a branch gallery extends to the lower face of the dam, where there is a manhole giving access to this gallery, and where the seepage water may be observed. In addition to this there are placed 16 feet apart and 12 feet from the upstream face of the dam vertical holes 16 inches in diameter, to intercept any leakage into the concrete, these holes also extending to the lower gallery. Each of these holes is constructed by a pillar of blocks containing openings of the specified diameter, these blocks being made of very dry, lean concrete with the idea that, being porous, they will admit water to the drain holes. Should leakage into the well holes become excessive, it is possible that these will be filled with clay or other substance to cut off such leakage at the expansion joints.

In front of the lower face in the center of the dam is a gate chamber in which are several compartments and the gates connecting them which allow complete control of the flow from each of the basins into the conduit. The excavation for this chamber extends 60 feet into the bed rock, and this excavation has been completed and the foundation concrete has been placed and the gates are now being put into position.

ROUNDOUT SIPHON. LINED TUNNEL SHOWING QUARTER BEND TO UPTAKE SHAFT

The work on the dikes has not progressed as rapidly as that on the dam, chiefly because this was not considered so necessary. The concrete core walls are kept about 20 feet higher than the embankment. Work on the latter is carried on only during favorable weather, when the earth is not too muddy for proper compacting and when it is not subject to freezing. Consequently, little has been done on this work since last fall.

Of the aqueduct possibly the most interesting parts are the tunnels, and of these the one which has attracted the most attention is that under the Hudson River at Storm King. For several years borings were carried on; first, vertical ones at intervals across the river from shore to shore, and later inclined ones from the shore to the center of the river; the object being to locate the tunnel at a depth which would insure the whole of it being in solid rock and having above it a sufficient depth of rock to withstand by the weight of the superposed material alone the upward pressure of the water in the aqueduct. In the center of the channel a fault in the rock was found which extended approximately 1,000 feet below the surface of the river. A vertical drill hole was carried at this point to a depth of 768 feet below mean high tide, when it was thought impractical to extend it any further. Inclined drill holes were then started from each bank of the river and extended toward the center until they crossed each other. Two sets of these were driven, the upper pair crossing at a depth of about 768 feet below mean high tide. At this depth the core showed an unbroken bed of gneiss throughout. It was then decided to locate the tunnel with the soffit of the arch having an elevation of -1,100 on the east side and -1,097 on the west side, thus giving at least 330 feet, and probably 500 feet or more, of solid rock above the tunnel. The tunnel aqueduct will be circular in cross section with an inside diameter of 14 feet and will have a uniform slope, falling three feet from the west toward the east shaft. The latter shaft is carried 42 feet below the tunnel to serve as a sump for de-

TUNNEL LINING COMPLETED, AND WITH SIDE WALLS ONLY COMPLETED

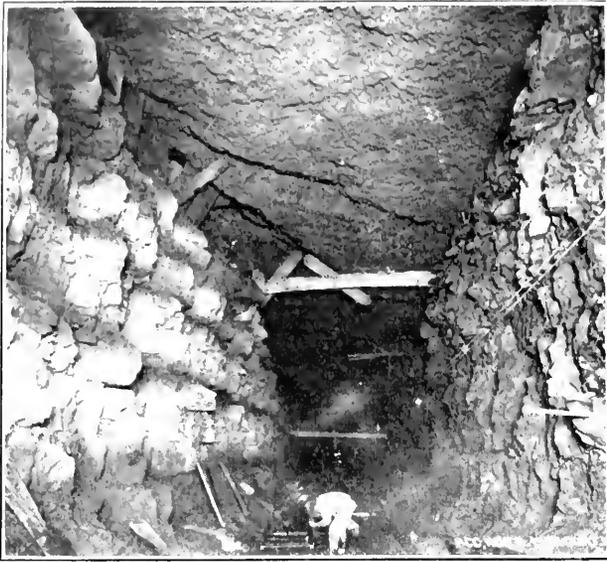

watering the tunnel should it be desired to obtain access to it. The two shafts have been completed to the depths named, this work having been done by the Board of Water Supply by day labor; and the Board has also started the tunnel from each shaft and completed 268 feet of heading from the east shaft and 150 from the west shaft. At this writing it is expected to award the contract within a very few days for completing the tunnel.

This tunnel will be lined with concrete mixed 1 : 2 : 4, rather wet, and precautions taken to give a smooth surface by greasing the forms and spading the stones back from them.

Other tunnels along the line are nearing completion, these

ROUNDOUT SIPHON. INVERT IN PLACE AND FORMS READY FOR SIDE WALL CONSTRUCTION

SHOWING FLAT WATER-WORN SURFACE OF STRATUM IN ROOF OF TUNNEL; ALSO REGULAR SEAMS IN WALL OF TUNNEL.

The Seam Beneath the Roof Bed is a Mud Seam, which Has Displaced the Rock.

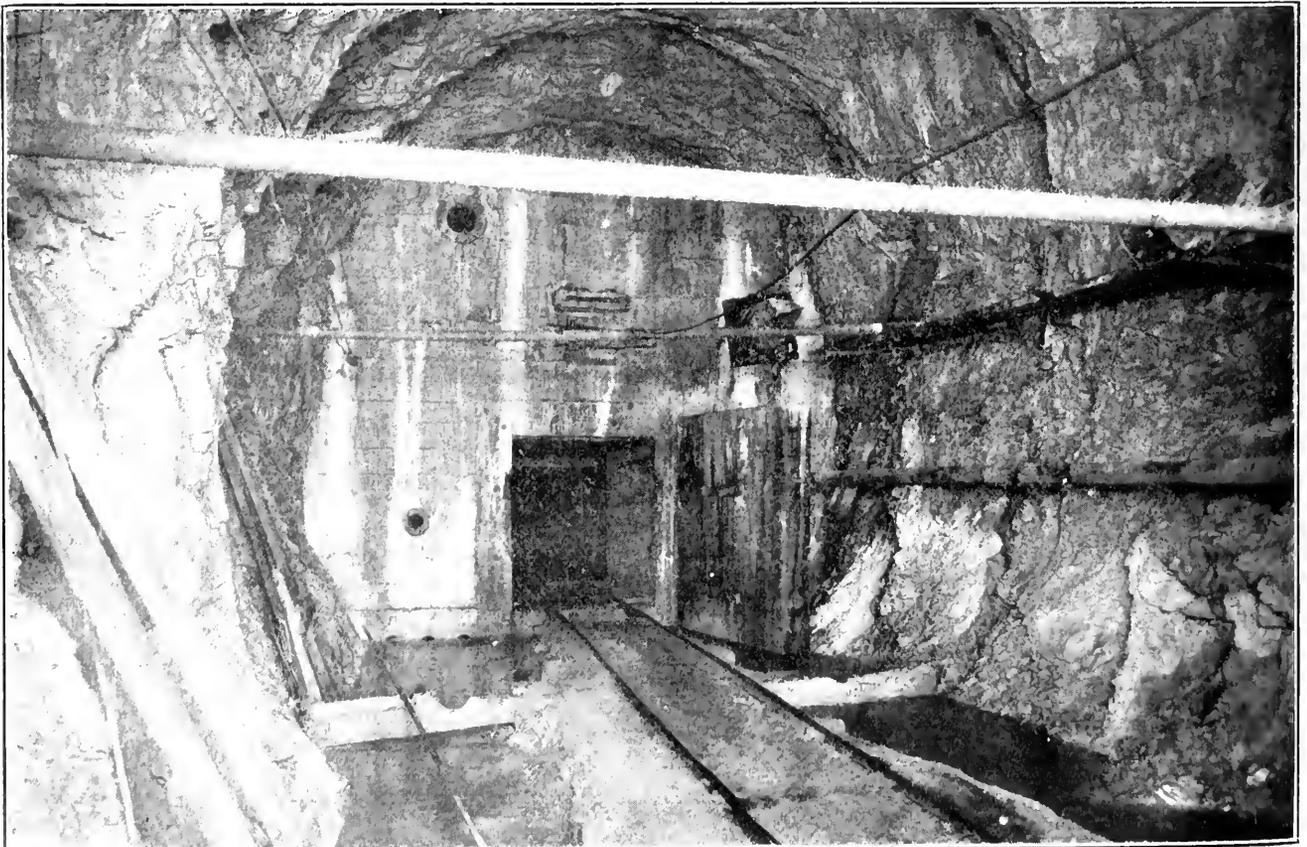

including several which follow the hydraulic gradient, known as "grade tunnels," others serving as inverted siphons, known as "pressure tunnels." A siphon tunnel under Rondout creek is about 24,000 feet long and one under the Walkill valley is about four miles long. The grade tunnels are of horseshoe section 17 feet high and 13 feet 4 inches maximum horizontal diameter. The pressure tunnels are circular, 14 feet 6 inches in diameter. Both these pressure tunnels are in rock, and as in the case of the Hudson River tunnel, are carried to such depth as to insure solid rock throughout their length. The

Rondout tunnel was carried somewhat deeper than this requirement called for in order to avoid as much as possible a stratum of grit which would be extremely difficult to bore through. This brought the tunnel over 400 feet below the surface of the ground.

The tunnels are lined with concrete, Blaw forms being used as centers in most of the work. The lining of the pressure tunnels is placed in three sections, an invert section 5 feet wide being placed first, on which, when it has set, is laid the contractor's track for carrying the forms, the concrete, etc., for completing the lining. Following this the side walls are built, and after this the arch.

One of the interesting features of this tunnel work, which is mostly in limestone, has been the seams and caves encountered. Some of the latter extend for an unknown distance at right angles to the tunnel. When these are encountered the earth found in them is removed to a distance of approximately 20 feet from the tunnel in the case of large caves which extend this far, and this space is filled with concrete. Smaller seams are cleaned out as far as practicable and likewise filled with concrete. One of the illustrations shows a rather wide seam which has been cleaned out for several feet and the remaining earth held in place by steel channel beams placed vertically and held in place by wooden struts. The concrete backing is packed against these steel channels, each wooden strut being removed as the concrete reaches it; this construction being adopted in order to leave no perishable material in the structure.

Wherever there is a seam or hole through which water seeps into the tunnel, a weep-hole is left through the concrete and a corresponding opening in the form, allowing the water to drain into the tunnel while the concrete is being placed. After the completion of the tunnel grout is forced into all these holes under a pressure of 300 pounds to the square inch to render the aqueduct perfectly tight. As it is found that the concrete in the arch section tends to settle away from the

MASONRY DAM CONSTRUCTION

Provision for Slight Settlement and Resulting Stresses—Increase in Unit Pressure and Reduction in Section Warranted
—American Engineers Commended

IN the presidential address of Edward Sandeman, president of the Association of Water Engineers (England), he took as his theme the construction of impounding reservoirs, and especially the construction of masonry dams. His principal thought was the importance of studying and making allowance for the effect of both compressibility of foundations and masonry and temperature changes upon the masonry, and also the unit compressive strength adopted as a maximum.

He said, in part: I hope that in the future those who are engaged in masonry dam construction will devote especial attention to the recording of the amount of settlement in the foundations, and that, if possible, some information may also be gathered relating to the compression of masonry itself due to its own weight. It has generally been considered (and one authority at least lays it down as an axiom) that for a masonry dam it is absolutely necessary to have an unyielding foundation to build upon. But while such a foundation is no doubt an ideal one, it is to be remembered that all materials are more or less compressible and that settlement must always take place to some extent in the case of the hardest rocks, the amount being, of course, exceedingly small and without doubt difficult of accurate measurement. Masonry dams built upon shale and materials of a similar character must of necessity produce a compression greater than that produced upon the harder rocks, and in these cases measurements of the amount of compression brought about by a given weight could be ascertained without much difficulty and the results recorded. It seems certain that, as the knowledge obtained from such observations accumulates, it will no longer be held that a masonry dam foundation must be an unyielding one.

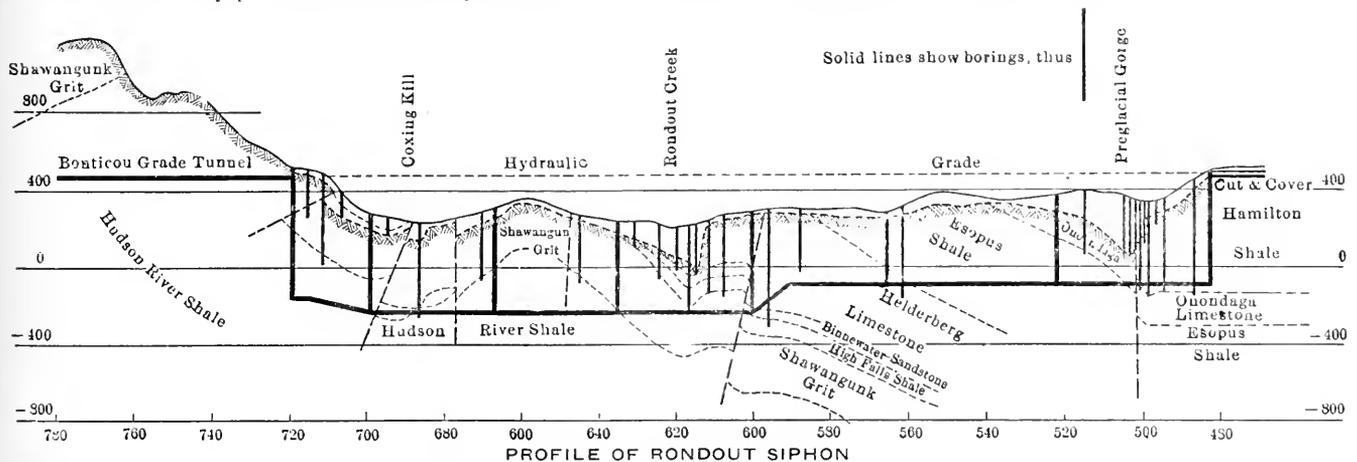

It will not infrequently occur that the various parts of the foundation of a masonry dam, even when this is bedrock, will differ slightly in compressibility, and there must consequently be some adaptation of the masonry to the unequal yielding. Moreover, the compressibility of the masonry itself will probably not be the same as that of the rock, and consequently the settlement in sections of the dam which have different heights, owing to the variation in the depths of foundations, will differ. That masonry will adapt itself to pressure is known, but the extent of its adaptability had not, as far as Mr. Sandeman knew, been ascertained or calculated. Experiments made to determine the movement of high dams when subjected to water pressure have shown slight movements, in all probably bending movements and not due to a real motion of the dam as a whole. It seemed to him probable that when concrete was subjected to a continuous strain for a long period, its continuing to set more firmly through a period of years would enable it to gradually eliminate the strain and the concrete

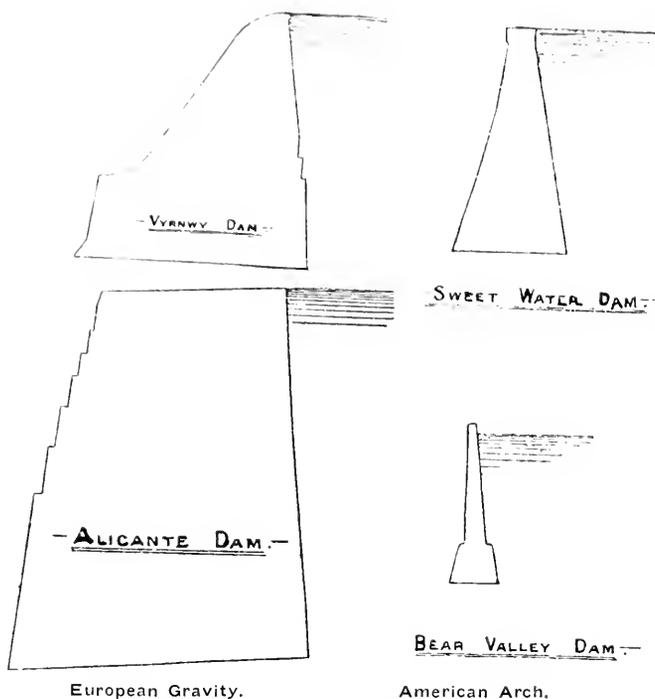

STEEL LAGGING IN MUD SEAM IN SIDE OF TUNNEL

crown after being placed, thus leaving a cavity, similar openings or weep-holes are left at frequent intervals along the crown and dry material placed there while placing the arch concrete; and here also grout is forced in under pressure to completely fill this section of the arch and give it a firm bearing against the rock.

These seams admitted more or less water into the tunnel and the contractors were compelled to keep extensive pumping plants in the tunnels for removing this water to the surface. One of these took the precaution of building a substantial bulkhead of concrete across the tunnel just beyond his pumping plant, this being provided with heavy bronze doors which could be closed practically water tight, in order to prevent the flooding of the pumps should they break down at any time. This bulkhead is shown in one of the illustrations. As a matter of fact this pumping plant did break down and was out of commission for several days; and it is probable that this precaution saved the contractor the expense and delay of pumping out the flooded tunnel with a portable plant located in the shaft, instead of by the comparatively rapid and inexpensive work of the stationary plant which was thus protected.

SOME EXTREMES IN DAM SECTIONS

would take a permanent set in its final position and thus retain its full strength.

Probably of greater magnitude than these movements and stresses due to compressibility is the movement due to variations in temperature. "It was formerly considered that temperature practically remained constant a few feet within a mass of masonry, but even in this country (England) with its moderate temperature, it has been found that 30 feet from the face of a dam there is a change between winter and summer of about 5 deg. Fahr. Close to the surface—say, within one inch—the temperatures vary as much as 70 deg. Fahr. Contraction in masonry produced by low temperature is a much more troublesome thing than expansion and one which in large masses of masonry almost invariably produces cracks of smaller or greater dimensions." Mr. Sandeman referred to observations made on the Boonton, N. J., dam, 2,150 feet long, in which the sum of all the cracks measured was $3\frac{1}{2}$ inches. He stated that if concrete were placed at a temperature of 60 deg., which was raised to 70 deg. by the chemical action, and that this fell during the winter to 40 deg. in the masonry within 10 feet from the face, this fall of 30 deg. would cause a theoretical contraction of about 2 inches in 1000 feet, which would cause a tension in the masonry of 21 tons per square foot, sufficient to cause cracks in almost any masonry. Cracks thus caused commence at the top of the dam where it is thinnest and extend downward as the cold increases with a kind of tearing action.

The same stress exerted in compression by the expansion of the masonry could be resisted without injury, and it has therefore been suggested that the masonry be laid in cold weather. But to do this would involve building in winter time only, which is an inconvenient and expensive method and liable to introduce more objectionable features due to the freezing of the mortar. Mr. C. S. Gowen, resident engineer on the Croton dam, suggested covering masonry built in the summer time with a thick coating of masonry placed in the early winter so as to prevent the development of cracks in the upper part of the masonry, and this Mr. Sandeman considered a valuable suggestion and quite practicable. That this consideration of the effects of temperature is not a heedless one is shown by the fact that nearly all masonry dams which have been constructed show sooner or later the effect of change of temperature.

In speaking of the limiting stresses in dam masonry he

referred especially to the Croton dam, in which a stress of 14 tons at the base of the downstream face and 15 tons at the base of the upstream face were used in calculating the design. "Credit is due to the American engineers for their boldness in deliberately designing a dam which, while exceeding in height any existing dam by nearly 100 feet, at the same time was calculated to resist stresses so far in advance of anything previously contemplated. French engineers had already constructed dams in which the pressures on the base reached $6\frac{1}{2}$ to 7 tons, and Rankine, in a report dated February 9, 1871, suggesting masonry dams in connection with the water supply of Bombay, had even fixed a limit as high as 20,000 pounds for the upstream base, although he limited the pressure on the downstream base to 15,625 pounds for reasons which he set out, but this great increase in the limiting pressure on the masonry is a striking feature in the design of the Croton dam and one which engineers cannot do otherwise than admire. It is possible the designers were influenced in their decision by the known fact that greater pressures than those fixed by Rankine had already been borne safely by existing masonry. The granite ashlar in the Bear Valley arched dam in California is compressed to the extent of 40 to 50 tons per square foot, and even brickwork has been known to bear as much as 26 tons. Another good reason for increasing the compression limit is to be found in the greater strength now obtained from our cementing materials. So long as the mortar binding the stones of a dam together is weak, the compressive limit must be correspondingly low, for it may be taken that the stone used is stronger than any ordinary mortar; but in these days when cement is obtainable of a uniform character and high strength, there is no longer any reason to confine the compressive stresses to figures below those employed by our friends, the American engineers."

GROSSMAN SYSTEM OF SLUDGE TREATMENT

Past failures have not discouraged those who are laboring on the problem of recovering a part, at least, of the valuable matters in sewage. One of the latest propositions is that of Dr. J. Grossman, a trial of which at Oldham, England, is said to have been very successful. The town has for years been compressing its sludge and filling low land with it, but all available land has now been filled. Dr. Grossman proposes to dispose of it as follows:

By my method the expensive and disagreeable process of filter pressing is altogether eliminated. The settled sludge passes continuously and automatically into a specially constructed drying machine, which delivers it straight into a retort in a dry state, and in which it is mixed automatically with a small quantity of sulphuric acid and subjected to the action of superheated steam. The latter carries away with it all the greasy matter contained in the sludge. This is collected in tanks, and being rich in fatty acids finds a ready sale.

The residue in the distillation retorts is discharged as a fine, dry, brownish powder, free from smell, and contains nitrogen, potash and phosphoric acid mixed up with humus-like earth, which renders it extremely valuable as a manure, being sterilized by the superheated steam. It is free from seeds, germs, or bacilli; it can be stored or used on land without creating a nuisance. The process is continuous and automatic, and thus very little manual labor is required.

The sludge dried in my drying machine is so rich in fat and other combustible matter that mixed with a little coke it can be used as fuel for drying a further quantity of the sludge, and in that case a cake of the same consistency as obtained from the filter presses at a cost of 3s. 6d. for pressing alone can be produced at a cost of 9d. per ton. It is computed that 400,000 tons of soap are used every year in this country, practically all of which finds its way into the sewage, and the recovery of fat alone from that source is sufficient to effect a considerable saving in the present mode of sludge disposal. Besides this, my method yields a cheap manure, valuable for agricultural purposes, and obviates all the nuisance and danger to health arising now from present processes of sludge disposal.

All of which seems practicable, provided the sludge can be dried at a low enough cost. But this detail has so far proved the financial obstacle to success in all similar methods of utilizing sewage solids.

WATER RATES

Scientific Calculation of Rates on Basis of Cost of Service—Service Charge and Quantity Charge—Former Regulated by Size of Service and Meter—Adequate Method of Accounting Essential

THE general superintendent of the Sewerage and Water Board of New Orleans, George G. Earl, in making over and practically re-creating the water distribution service in that city and the management of the department, following upon the completion of the filtration plant to which we have several times referred, has established a system of water rates which he believes to be based upon a logical consideration of the several factors which enter into the problem. The general theory upon which this system of rates was based was described by him in a paper before the American Water Works Association.

Practically nothing was said by him concerning the flat rates, since these rates have been nearly eliminated in that city and almost all of the services are metered. This was brought about by such a relative adjustment of the flat rates and meter rates that the average small consumer pays less than one-half as much for water under meter rates as he was paying under flat rates; and yet the reduction in consumption, or rather in waste, has been so great that the department is abundantly justified in making the lower meter rates. A logical or scientific basis for flat rates would be very difficult to evolve, and some consider that such a thing is impossible, since the very idea of flat rates is illogical and unscientific.

Mr. Earl believes that the only logical and just method of charging for water is to consider each item which enters into the cost of furnishing or supplying the water, and include in the rate a charge for each of these which is not greatly in excess of the cost of the same. The rate would be divided into two general items; first, a "service" charge which will justly differentiate between different characters of service and cover certain costs which are applicable only to the individual served; and second, a charge or charges based upon the quantity of water delivered or of service rendered. In fixing the New Orleans rates he determined as nearly as possible the first cost and essential divisions of the system; the cost of operation, maintenance and depreciation, including interest, with the essential divisions thereof; and third, the essential divisions of the consumption. A proper system of accounting in the department would permit the determination of each of these. Given these figures, he draws a distinct line between those items which should be paid by the taxpayer and those which should be paid as water rates by the consumer, maintaining that public institutions of all kinds, municipal departments and the like, should pay water rates like private consumers, even if such rates are actually paid from the tax fund. It is clearly inequitable, he maintained, for the consumer to pay for water privileges for the schools out of his water rate, since the ratio between his water rate and the sum of all the water rates may be entirely different from that between his school tax and the total of all school taxes.

For metered consumers—and he would place in this class every use of water except through fire hydrants—there would be a service charge depending upon the size and kind of meter and connection, which charge would be the average cost of reading meters of that class, collecting and accounting of water rates, inspection of connections, meters and premises, and interest charges upon, and maintenance and depreciation of, those factors which are essentially and exclusively for the individual consumers—all plus a fair profit if the plant is privately owned. When these variations in the cost of serving different consumers are thus provided for there remains the water itself to be paid for, and Mr. Earl sees no reason why one consumer should be served with this at a lower rate per unit of quantity than another, no matter how great or small his consumption, or whether the consumer be a private individual, corporation or public institution.

A rate built up in this way, based upon known or ascertainable facts and costs, is readily applicable to any conditions and permits of easy adjustment as conditions change. Such rates are easy to understand, court-proof and fool-proof. With such a system as this established the water superintendent or water company has an answer which any citizen can understand to the frequent complaint that "other cities have lower rates," accompanied by a demand that the rates in the city in question be lowered to the same basis. On the other hand it would enable a tax payer or consumer to determine in what respect the department in his own city is being operated less economically than those of other cities.

There are, of course, a number of items to be considered in making up the rates, which are not perfectly apparent at first thought. One of these is the fact that most meters under-register when the quantity of water passing through them is very small; and that this under-registration increases with the diminution of the stream. To meet this point Mr. Earl would establish a minimum rate for the water itself, which rate would be sufficient to allow for such deficiency in registration. These quantities he has fixed for New Orleans as follows: $\frac{5}{8}$ -inch meter serving not over two persons and rooms, 10,000 gallons per year; $\frac{3}{4}$ -inch meter serving not over three persons and rooms, 20,000; $\frac{1}{2}$ -inch meter serving not over four persons and rooms, 30,000; $\frac{1}{2}$ -inch meter, no limitation, 40,000 gallons. For the larger sizes there is no limitation, the quantities upon which minimum charges are based being: $\frac{3}{4}$ -inch, 50,000 gallons; 1-inch, 65,000 gallons; $1\frac{1}{2}$ -inch, 105,000 gallons; 2-inch, 145,000 gallons; 3-inch, 220,000 gallons; 4-inch, 360,000 gallons; 6-inch, 635,000 gallons; 8-inch, 970,000 gallons. For all of the no limitation rates the New Orleans fixed or service charge is 10 cents per 1000 gallons. The service charge is \$4 for the $\frac{5}{8}$ -inch meter, \$5 for $\frac{3}{4}$ -inch, \$6.50 for 1-inch, \$10.25 for $1\frac{1}{2}$ -inch, \$14.50 for 2-inch, \$22 for 3-inch, \$36 for 4-inch, \$63.50 for 6-inch and \$97 for 8-inch. To this service charge is added the quantity charge of 10 cents per 1000 gallons regardless of quantity, except that no quantity charge will be made for less than the minimum quantities named above.

The two divisions of the charge are not given on the bills because this has been found by Mr. Earl to have "an irritating effect upon the mentality of many consumers who are so used to unfair and illogical charges that they assume that any charge whatever, under a new name, is a new form of extortion." Consequently, while the rate has really been calculated scientifically, its final form as presented to the public contains no perplexing intricacies. Another advantage which he claims for this method of rate making is that it provides a way to fairly differentiate between a minimum rate and quantity and charge for a compound or detector meter used on a fire service and a disc, velocity or other non-compound meter used on an ordinary service.

Where one meter is made to serve two or more houses the water rates for which are guaranteed by one responsible owner, the cost per house or per family may be ridiculously small, and there are many cases in New Orleans where it is so. Thus a family occupying a two- or three-room house would have to pay but \$1 or \$2 per year plus their share of the \$4 meter charge, assuming that they did not consume more than 10,000 gallons in the smaller house or 20,000 gallons in the larger during the year. Mr. Earl states, however, that these low payments just as fully reimburse the board for the service rendered as do those made by the largest consumer for the service rendered to him, since the \$4 service charge covers the cost of looking after the service, reading the meter, keeping it in repair, etc., regardless of how much water passes through it.

FIRE HYDRANT RATES

Rational Method of Fixing Hydrant Rates, Based upon Cost of Service—Percentage of Cost of Distribution System Chargeable to Such Service—Cost per Capita—Value of Fire Protection

(Abstract of paper before American Water Works Association, by Leonard Metcalf, Emil Kuichling and W. C. Hawley.)

A BASIS for the determination of a reasonable or legitimate return for public hydrant or fire protection service has, so far as the writers are aware, never been outlined or passed upon judicially by our courts in such a manner as to be of general applicability. The rate established has usually been based upon one of two considerations—either that it should not exceed the average rates paid in the surrounding district or State, or perhaps in the nearest large city; or that the hydrant rental should be substantially equal to the interest charges upon the necessary investment, leaving the water rates to meet the operating, maintenance and depreciation charges and profit. Consequently the existing hydrant rentals are of little value from a theoretical standpoint in assisting to a determination of what constitutes a just and equitable rate.

This paper outlines a rational mode of determining how much income should be derived yearly from the general public fire protection service rendered through public fire hydrants. It does not consider the value of the kindred service rendered by supplying water to special fire-extinguishing apparatus in private buildings, but if the community as a unit bears the cost of the extra capacity required for fire protection, no large additional revenue from special fire protection service can be expected, especially as it requires no capacity additional to that provided for the public protection.

The authors present a table of hydrant rentals in a large percentage of the cities of the country, derived from data compiled by Messrs. Jordan and Grey, of the Indianapolis Water Company. Grouping these according to localities, the table shows that the average rate in 22 cities in the Eastern States in 1909 was \$29.38; the average of 73 cities in the Central and Southwestern States was \$45.03; the average of 24 cities in the Southern States was \$42.54; the average of 6 cities in the Western States was \$28.42; and the approximate average of the total number was \$41.05. The average of all cities except those in the Eastern States was \$43.48, approximately 50 per cent greater than for the Eastern States alone. Inquiries as to whether there had been an increase or decrease in hydrant rentals during the last 20 or 30 years did not secure very satisfactory replies, but these indicated that no substantial reduction had taken place during the past 30 years.

Special reference is made to the statements of the Railroad Commission of Wisconsin (which is practically a general public service commission), which practically expresses its opinion that the revenue derived from public fire protection service is rarely commensurate with the cost of the service. In certain of its reports it makes the following statements:

In the Appleton water works case engineers and experts estimated that the cost of constructing that plant would have been reduced by from 40 to 50 per cent if the plant so constructed had been designed only for domestic use. * * * The separation thus made shows that 54.5 per cent of the plant at Ashland is made necessary to satisfy the demands of the city. It follows that 54.5 per cent of the capacity, or fixed cost of service, should be charged to the city to cover the cost of furnishing water to schools, fountains, other public buildings, for flushing and for fires. * * * Private water consumers have borne a part of the burden which properly should be borne by the taxpayers. The entire community derives the benefit from adequate fire protection, and the cost of this protection should be pro-rated on the entire taxpaying population. * * * It requires no demonstration to show that a large part of the water plant in every town, where the city is a user, is simply held in readiness for the purpose of fire protection. It may not be called into use very often, yet the investment is there and is held in constant readiness. * * * The proportion of the investment necessary for the public service may vary somewhat, depending upon local conditions. It has been held by engineers and water works men, whose experience and study of the question make their opinions of weight, that this

proportion will but seldom, if ever, go below 50 per cent of the total cost of the plant and system.

The Wisconsin Commission decided that in the Madison City case 75 per cent of the total investment was made necessary for fire protection and other public purposes.

The writers believe that the ordinary method of charging so much per hydrant, usually with the additional provision that an additional hydrant should be ordered for every 600 feet, more or less, of extensions in the distribution system, is a less equitable one than would be the payment of a lump sum for public hydrant service, granting to the city the right to attach as many hydrants as it may desire to the water mains of the company, upon the additional payment of the actual cost of such additional hydrants and connections, and making provision for the increase of this annual payment for hydrant service upon some such basis of payment as pro rata increase in population or assessed valuation or pipe line mileage within the municipality or district served by the water works.

Reference is made to the standard recently adopted by a water company which supplies a number of municipalities, which was as follows:

ANNUAL CHARGE FOR FIRE PROTECTION SERVICE.		
Period of contract.	Per mile of distribution pipe system.	Per fire hydrant in service.
1 year	\$325	\$15
10 years	275	6
20 years	260	5

The charge for fire protection service is a combination of mileage charge and annual charge per hydrant, the latter being designed to carry the approximate maintenance and fixed charges of the hydrants.

Obviously the equitable hydrant rental lies somewhere between the cost of the service to the water company and its value to the community. Unless the value is greater than the cost there will be no demand for such service.

The reasonableness of the charge for hydrant rental may be reviewed from five points of view:

1. The cost of furnishing fire protection service.
2. The value of this service to the community, as measured by the saving in fire insurance premiums, ignoring the effect of the economic waste resulting from loss in business, income and wages, in the reconstruction period following the fire, and the loss of property that cannot be replaced.
3. The actual and desirable number of hydrants and distance between them, and the annual rental per hydrant resulting from the assumption of certain gross annual payments for fire protection service.
4. The effect upon taxes, based upon the assessed valuation of property in the municipality or district served, and different assumed annual charges for fire protection service.
5. The relative cost of different kinds of public service—police and public safety, light, and fire protection—in the community served.

COST OF FURNISHING FIRE PROTECTION

The writers do not believe that the general assumption that one-half the cost of water works is on account of fire protection service, regardless of the population and other conditions, is a safe or true one. They believe that the cost of the portion of the water works plant involved by fire protection service probably constitutes from 60 to 80 per cent of the entire cost of the physical property in the case of communities having less than 5,000 population; 20 per cent to 30 per cent in communities of 100,000 population, more or less, and perhaps 10 per cent to 20 per cent in the case of our largest cities.

A diagram is presented showing the opinions of several en-

as follows: 10,000 population, 1.718 per cent; 25,000 population, 1.417 per cent; 50,000 population, 1.254 per cent; 100,000 population, 1.135 per cent; 150,000 population, 1.082 per cent; 200,000 population, 1.051 per cent; 250,000 population, 1.030 per cent; 300,000 population, 1.015 per cent. This means that, for instance, in a city of 100,000 population the supply main would require to have a diameter 13.5 per cent larger than if there were no provision for fire protection.

The authors give a table containing the quantity of water in gallons per minute stated by the National Board of Fire Underwriters to be desirable for each of about 125 cities. These quantities do not bear a fixed ratio to the population, since structural conditions and the extent of the high value district and of the conflagration hazard, as well as the fire department strength, have some bearing on these quantities. The authors have, however, attempted to construct a curve approximately representing the requirements of the Board of Fire Underwriters in relation to population, the equation for which is $Y = 1020 \sqrt{X} (1 - 0.01 \sqrt{X})$, in which Y equals gallons per minute and X equals population in thousands. According to this, the portion of the carrying capacity of the pipe system chargeable to fire protection service would be somewhat greater than that already given, these percentages being as follows:

10,000 population	83%
50,000 population	54%
100,000 population	37%
200,000 population	19%
300,000 population	9%

The authors believe that the minimum values in both this table and the previous one are too low, but that the curve probably indicates the general tendencies.

The authors have used their best judgment to determine the approximate percentage of the total cost of water works plants, taken as a whole, which is involved by the requirements of fire protection service, taking into consideration not only the distribution pipe system but also any additional cost involved in

the water supply and reservoir systems, pumping capacity, etc., and the limitations of the assumptions made above as to per capita consumption and fluctuations in rate of water consumption in cities of different sizes. This percentage they represent by the formula $Y = \frac{147}{X^{0.31}} - 12.1$, in which Y equals per-

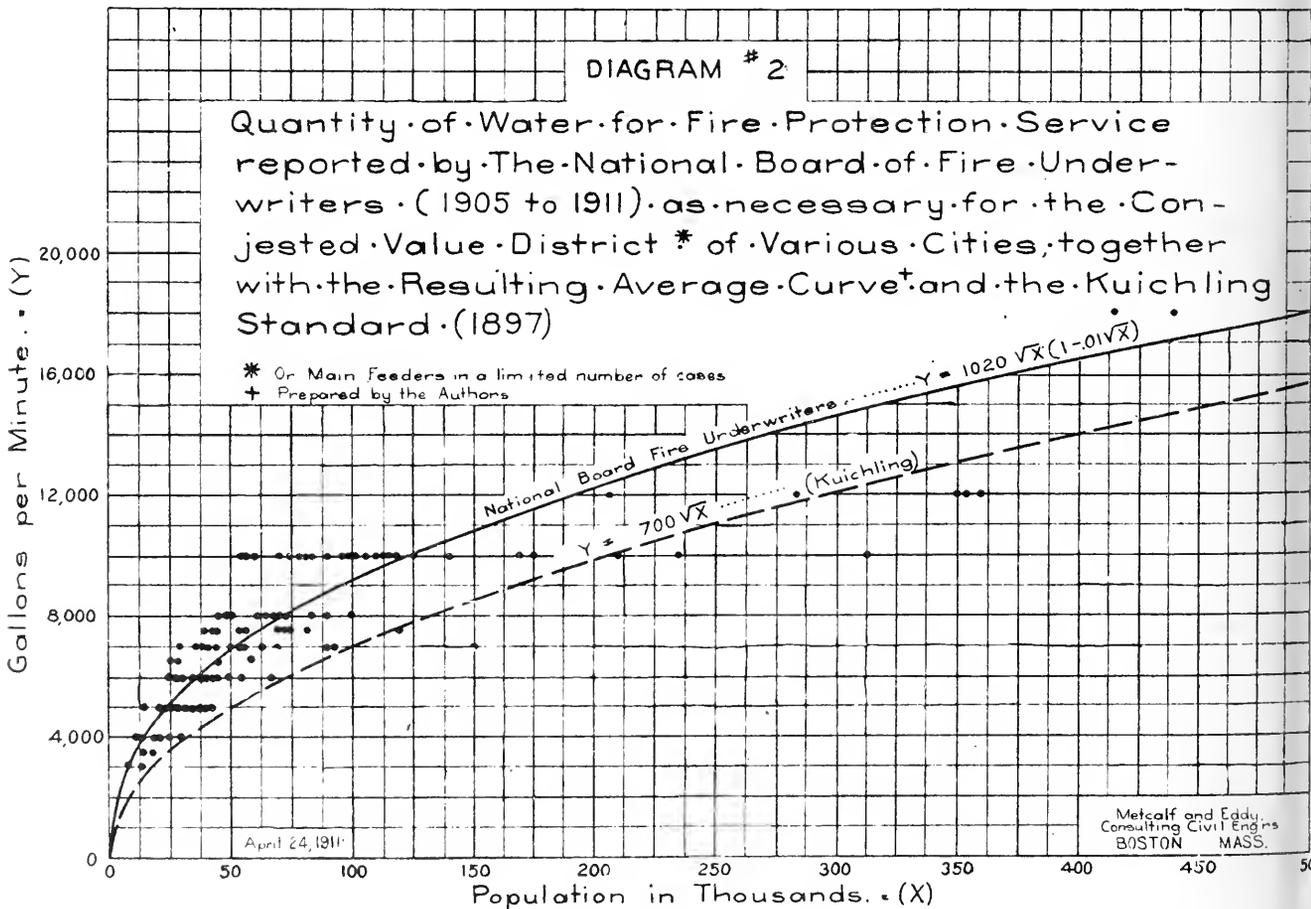

centage of total cost and X equals population in thousands.

In connection with this, as in fact with most of the formulas and figures given, they especially state that these are to be considered of comparative value only, as indicating general tendencies, realizing that substantial departure from the normal conditions assumed is to be anticipated in individual plants; so that if reliable information is desired concerning any particular plant the studies should be based upon the actual conditions existing at that plant. The equations and relations are summed up in the following table.

ESTIMATED COST OF PORTION OF WATER WORKS PLANTS, CHARGEABLE TO FIRE PROTECTION SERVICE.

Population.	Cost of Distrib. Pipe System in Percent. of Total Cost of Water Works.	Percent. of cost of Distrib. Pipe System Chargeable to Fire Protection Service under Nat'l Bd. of Fire Underwriters' Standard.	Percent. of Cost of Entire Plant Chargeable to Fire Protection Service.
		Kuichling Standard.	
5,000	72%	..	77%
10,000	68%	50.3%	60%
50,000	54%	23.8%	32%
100,000	47%	13.1%	23%
300,000	39%	1.6%	13%

The data obtainable relating to operating and maintenance charges involved in fire protection service were meager. It is believed that these charges lie between 5 and 10 per cent of the total annual operation and maintenance charges, including taxes but excluding depreciation, interest and profit allowances. Assuming a gross income for small works of 15 per

QUANTITY OF WATER CONSIDERED NECESSARY FOR FIRE PROTECTION BY NAT'L BOARD OF FIRE UNDERWRITERS

nt of their value, and assuming 10 per cent of this chargeable hydrant protection service, they obtain an annual cost of operation and maintenance equal to 1.5 per cent of the value of the property; and for large works by similar assumption obtain 5 per cent of the value. For depreciation, interest and profit allowance they assume a depreciation of one to 2 per cent; interest, 6 per cent; profit, 0 to 2 per cent, giving a total of 7 to 10 per cent of the value of the portion of the system involved by the protection service. Applying these figures or assumptions to the general range of per capita values of water works, they obtain the following table:

ESTIMATED APPROXIMATE PER CAPITA COST OF PUBLIC FIRE HYDRANT SERVICE.

Item.	Towns of	Cities of	Largest Cities.
	5,000 Population.	50,000 Population.	
(1)	(2)	(3)	(4)
Value per capita of water works..	\$20.00	\$30.00	\$35.00
Percentage of portion chargeable to public fire hydrant service....	77%	32%	15%
Per capita value chargeable to public fire hydrant service.....	15.40	9.60	5.25
Operation and maintenance charges, approximately 10% × 15% = 1.5% of value of entire plant, for towns; 7.5% × 12.5% = 1% for average cities; 6% × 10% = 6% for largest cities	0.30	0.28	0.21
Annual charges on public fire hydrant service, covering depreciation and interest, say 8% of Item 3	1.23	0.77	0.42
Total annual charges per capita...	\$1.53	\$1.05	\$0.63

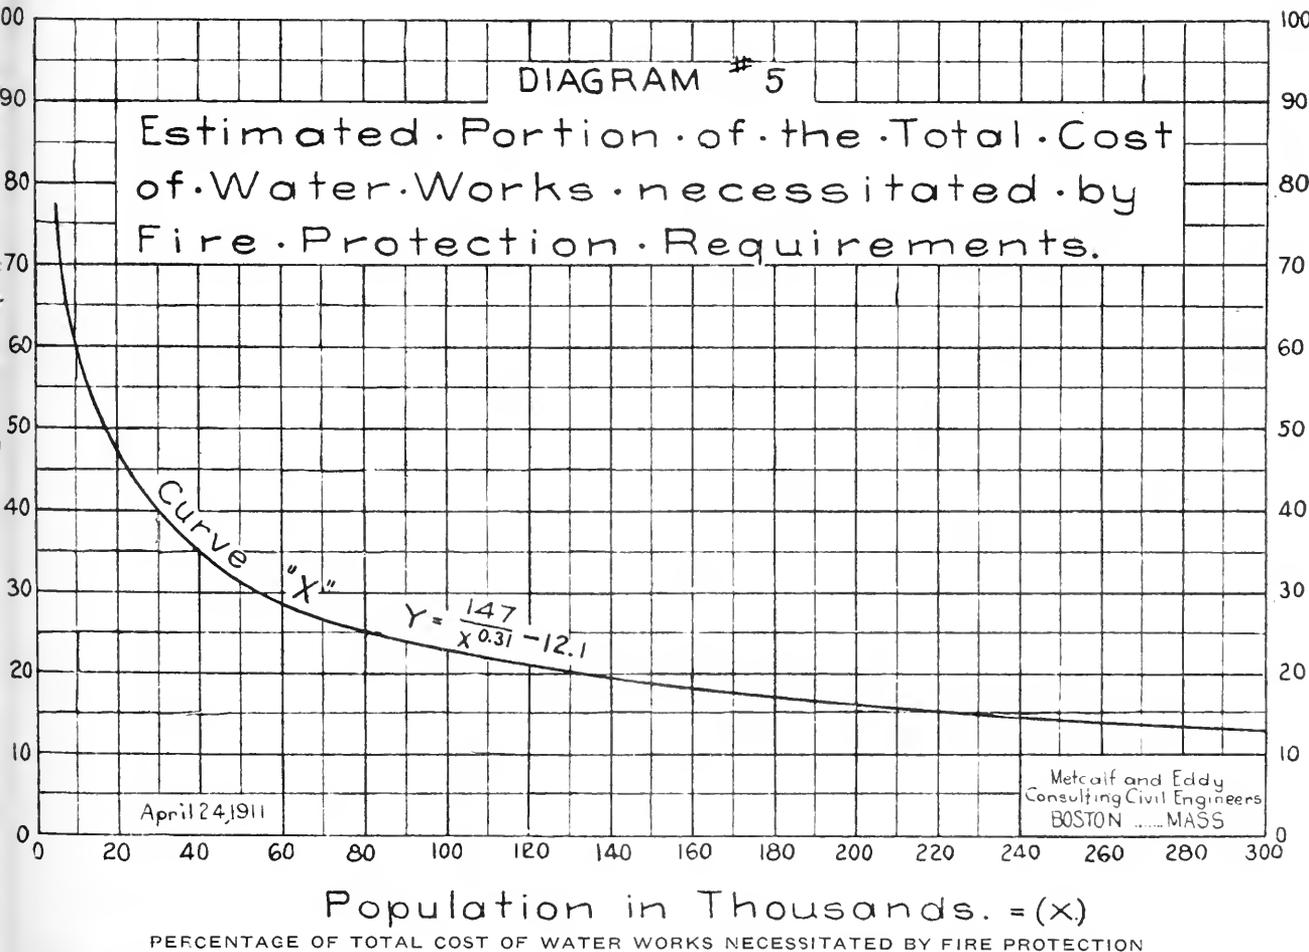

It is perhaps fair to infer, in default of more exact information, that the average cost of public fire hydrant service may be approximately \$1.00 per capita, with variation of about 40 per cent, more or less, though every plant must be examined individually, as the range of variation is obviously a large one. Water works receive an aggregate hydrant rental approaching

this amount, which is but another ground for the authors' contention that hydrant rentals rarely bear any relation to the cost of the service, usually being "traded out" as an offset to franchise and other business considerations.

Taking data contained in the census report for 1907 for population, miles of pipe and number of hydrants, and assuming a per capita cost of fire protection service of from 60 cents for the largest cities to \$1.25 for the smallest, the authors obtain an annual cost per hydrant of \$56 for cities larger than 300,000 population; \$42 for those between 100,000 and 300,000; \$58 for those between 50,000 and 100,000; \$55 for those between 30,000 and 50,000; or a general average for the country of \$55 per hydrant.

VALUE OF FIRE PROTECTION SERVICE

Concerning the value of fire protection service to the property protected and to insurance companies, the authors present a number of tables and figures obtained from fire insurance companies, the National Board of Fire Underwriters, the New York State Superintendent of Insurance and other sources. These figures include fire losses in various cities and States, fire risks, premium receipts, etc. They were advised by insurance men that the introduction of a water works system into a community effects a saving to the insured of at least 25 per cent to 33 per cent of his insurance rate, and a still greater saving to the insurance company. It is also stated that, with the stock fire insurance companies in New England, the prevailing average insurance rates in cities having a good water supply increase from one-fourth to one-third when the distance between hydrants is greater than 500 feet, and may be increased to even two or threefold upon mercantile property. Taking the figures obtained for Massachusetts, the authors find that, with a reduction in insurance rate of 20 per cent there would be a corresponding saving in insurance premiums of \$1.08 per capita of all population; while if the reduction should increase to 50 per cent the saving would correspondingly increase to \$2.70 per capita. Assuming that the actual saving to the insurance com-

families, and consequently the reduced risk, amounted to 33 per cent, there would be effected a saving of \$1.80 per capita per year by the fire protection service of a water system.

SPACING OF HYDRANTS

The system of charging for fire protection by hydrant rental or by any system based upon the number of hydrants is considered by the writers to be very unfortunate, as they believe the placing of hydrants close together should be encouraged—150 to 250 feet apart in important thickly built up districts, and 300 to 500 feet apart in residential districts. Even if the city is called upon to bear the added expense of making the installation, the saving to it in better service and in reduced length of fire hose required more than offsets the expense involved. Concerning this they quote the chief engineer of the Board of Fire Underwriters, George W. Booth, as follows:

Hydrant Spacing.—The quantity of water required for any district having been fixed upon, proper hydrant distribution may be best determined from a sketch plan of such a number of hose lines as are necessary to care for this quantity; a consideration of friction losses in hose indicates that for anything like effective service no hose line should exceed 600 feet in length if from a fire engine, nor 500 feet if direct from a hydrant, unless the hydrant pressure considerably exceeds that usually found where direct hydrant streams are depended upon. Comparatively few fire departments undertake to place more than one engine, serving an average of two hose lines, at a hydrant, or to use more than two direct hydrant streams from each hydrant. Under those conditions most high value mercantile and manufacturing districts will require at least one hydrant to each 40,000 square feet of area, and ordinary well-built-up residential districts one hydrant to each 100,000 or 120,000 square feet. As good or better distribution will be found in many of our larger cities, and in the case of mercantile districts corresponds roughly to a linear spacing of 150 feet and in residential districts of 300 feet. For each mercantile block 400 by 300 feet, center to center of streets, there should be at least three hydrants, probably located to the best advantage two at each street intersection and one intermediate hydrant on the long side of the block.

A table is given by the authors, showing the spacing of fire hydrants in 62 cities. The average distance between hydrants (number of hydrants divided into feet of mains) ranges from 290 feet in Schenectady, N. Y., to 883 at Lynn, Mass. The average of the 62 cities is 555 feet. The area served by a hydrant they consider a more valuable measure of efficiency than the linear distribution. This ordinarily ranges from about one acre per hydrant in districts of high value, to three acres, more or less, in well built up residential districts.

RECAPITULATION AND CONCLUSIONS

1. Public fire hydrant service in the United States is usually paid for upon the basis of an annual rental for each hydrant.
2. These hydrant rentals rarely bear any relation to the cost or the value of the service rendered.
3. They have heretofore usually been determined by average prices paid in the State or surrounding district, in the case of the larger communities, and by the requirement of meeting the interest charges upon the plant investment in small ones.
4. The range of hydrant rentals paid in the United States is in general from \$100 per hydrant per year to a nominal sum of \$10, more or less. The average hydrant rental is probably in the neighborhood of \$40.
5. Statistics obtained from 76 American cities supplied by water companies out of 140 circulars sent, indicate that there has been no substantial decrease in hydrant rentals in the last thirty years, the substantial reductions occurring in only about one-third of the cities from which replies were received. The data upon this subject are, however, not sufficiently complete to make general characterization safe.
6. The average number of hydrants per mile of distribution pipe system and the corresponding average amount of distribution pipe system per hydrant in 63 different cities in the United States are as follows:

	No. of Hydrants Per Mile of Distribution Pipe.	Average Amount of Distribution Pipe Per Hydrant in Feet.
Average of 63 United States cities.....	9.5	558
Desirable in heart of large cities.....	35 to 21	150 to 250
In closely built-up residential sections.....	26 to 18	200 to 300
In residential districts with houses well separated	18 to 9	300 to 600

The general tendency is to reduce the hydrant interval, and this is desirable. No hard and fast rule can, however, be laid down for the proper hydrant interval, local considerations, value of property, character of fire risks, water supply as to the size of mains and quantity and pressure of water available, danger of interruption of service, cost, etc., must control.

A better basis for the consideration of the adequacy of fire hydrant installation is perhaps to be had in a study of the area to be served by each hydrant in different parts of the city, the general range of values, under the best modern standards of service, being from one acre, in the mercantile and manufacturing districts of highest value, to three acres, more or less per hydrant in the well-built-up residential districts.

From an insurance point of view, however, the individual districts should be studied with reference to the number of fire streams which can be massed upon them effectually.

7. The additional cost of installing extra hydrants upon existing mains probably ranges from \$50 to \$150 per hydrant, the former corresponding to the outlying residential districts with unpaved streets, the latter to conditions existing in the heart of the city where the mains are large. The cost of installing hydrants at the time of building pipe lines is, of course, substantially less.

8. The cost of a modern steam fire engine of the sizes ordinarily used is \$5,000 to \$5,500. The cost per year of maintenance of a fire engine company, including the attending hose company over that of a hose company of corresponding strength, is about \$4,000, including operation, maintenance, depreciation and interest charges. The per capita annual maintenance cost is approximately \$1.50 to \$2, exclusive of the interest charges.

The fire engines have been found, recently, to deliver, under average conditions in tests, approximately 88 per cent of the rated capacity, the range in individual cases being from over 100 per cent to less than 50 per cent of the rated capacity but it is probably fair to say that under actual conditions prevailing during a large fire or conflagration, not more than 75 per cent of the above stated working capacity, or two-thirds of the rated capacity, is developed.

9. The danger from serious conflagrations, such as the Boston, Chicago, Baltimore and San Francisco fires: property and business losses resulting from them, the hazard involved in having so many services of different character, such as domestic and industrial uses, elevators, fire sprinklers, flushing devices, water motors, etc., upon the same main from which the fire hydrants draft their supply, and greater danger of interruption in service for changes in, and repairs upon them; the construction of buildings covering great areas and reaching to great heights, requiring very heavy water pressures; and relatively greater cost of maintaining steam fire engines to do the same work, have led to the introduction of independent high pressure fire protection systems in our largest American cities having one or more independent sources of water supply readily available at very short notice, in very large quantities and under pressures up to 200 or 300 pounds per square inch.

10. Hydrant rentals, or the demand for public fire protection service, may well be examined from five points of view:

- a. The cost of the service.
- b. The value of the service.
- c. The number of hydrants per mile of pipe and the distance between them and area served.
- d. The rate of taxation corresponding to the amount paid for public hydrant service.
- e. The relative cost of other forms of public service, such as lighting and police.

11. The cost of the portion of the water works plant involved by fire hydrant service probably constitutes from 10 to 80 per cent of the entire cost of the physical property in the case of communities having less than 5,000 population, and to 30 per cent in communities of 100,000 population more or less, and to 20 per cent more or less in the case of our largest cities.

The approximate annual cost of fire hydrant service is estimated at \$1 per capita, with variations of 40 per cent more or less in different communities, being perhaps from 60 to 75 cents in our largest cities, \$1 in average cities, \$1.25 to \$1.75 in our small well-served towns and cities.

These per capita costs of fire hydrant service amount to about \$55 per hydrant, based upon present practice as to number of hydrants per thousand of population, ranging from 11 to 23 in cities of from 300,000 population to 30,000 population, and per mile of pipe ranging from 10.6 to 12.1 in cities of the type first stated.

12. Data as to the value of fire protection service are very meagre. It is believed that a reduction in insurance premiums from 25 to 50 per cent results with the introduction of a good water works system, and that the actual saving is much greater, as based upon the returns made by the Insurance Commissioners in the State of Massachusetts.

The saving probably ranges from \$1.35 to \$3, as follows:

Rate of Reduction in Insurance	The Corresponding Saving in Insurance Premiums Per Capita Annually May Be Approximately.
20%	\$1.08
25%	1.35
33%	1.80
50%	2.70

13. The cost of public fire protection service is generally much smaller than that of police and public safety, and public lighting service.

14. The most common method for paying for public fire hydrant service in the United States seems to be by annual rental per hydrant, coupled with the requirement that one additional hydrant shall be ordered in the case of extension of the pipe system, for every 600 feet more or less of such extension.

15. Improvement is suggested along the following lines. It is provided that:

- a. At stated intervals, of say ten years or more, the annual cost of hydrant or fire protection service as then rendered, including in such cost operation and maintenance charges incurred by fire hydrant service, and depreciation, interest and profit allowances upon the value of that portion of the water works property necessitated by, or chargeable to it, shall be determined. In the latter, allowance for the so-called intangible values should probably be included in many, if not in all cases. This work should be done by an expert, or board of experts in water works practice, acting in a purely judicial capacity regardless of the method of appointment.
- b. Additional hydrants may be placed upon the existing water mains, subject to the approval of the water company, or other competent authority, provided an annual rental be paid for each such additional hydrant, which rental will cover the agreed estimated maintenance and depreciation costs, and interest charges involved by the estimated average cost (or varying cost upon a sliding scale covering different conditions, such as size of main, character of excavation, street service, etc.) of making such installation.
- c. The basic amount paid for hydrant rental be increased annually, to cover extensions of pipe systems made during the year (upon which extensions hydrants may be placed at an agreed interval of spacing) pro rata in the relation of the extension to the length of the pipe system at the time of the review of the hydrant rental question, or in the ratio of the relative assessed valuation of property as of those dates, or in the ratio of the population as of those dates, if the latter can be accurately determined, which is not usually the case. If additional hydrants be desired in excess of the agreed number per mile of pipe on extensions, they can be installed upon the basis outlined above in (b).

In this manner it should be possible to adjust the

hydrant rental annually, without serious issue, and the community will more nearly bear its share of the burden, divided between the public and private and industrial consumers than under the present method.

16. The offsetting of taxes, or franchise, by free or reduced cost of hydrant service, is believed to be undesirable. If the community sees fit to make a charge against franchise or other intangible property, it should be made quite independently of the hydrant rental, or fire protection service payment. The company and the city are both entitled to know just what burden they have to meet, and to be placed in a position to seek legal redress, in case of injustice or inequitable proceedings. The desirability or undesirability of franchise tax is not touched upon herein; the question is not here at issue.

17. In conclusion, the writers desire to call particular attention to the admirable reports which have been published by the National Board of Fire Underwriters upon the water works and fire departments of the leading cities of the United States, in which are contained not only many significant and valuable facts, but suggestions of importance to the designer of water works systems.

WATER WASTE SURVEY IN MEMPHIS

Census Taken by Service Districts—District Consumption Registered Continuously for a Week by Pitometer—Sources of Leakage

LATE in the year 1909 the chairman of the Board of Water Commissioners of the Water Department of Memphis, Tenn., recommended that a study be made of the waste and other losses of water which were believed to be taking place, with a view to their prevention; and it was decided to carry on such an investigation with the use of the pitometer. Population statistics were gathered during the winter and actual measurements begun in April, under the direction of the Engineering Department.

The section of the city in which the investigations were conducted and the outline of the different districts is shown on the "Progress Chart." The method employed is what is known as the Deacon System, which has long been used abroad, and in detail is as follows:

When the area to be investigated is defined a complete list of all the connections, metered and unmetered, in the district is obtained from the records kept by the department. The amount of water passing through each meter is obtained from the Meter Department, and from the census taken by this division the number of persons supplied by each connection is obtained. From these data the average per capita metered consumption is computed.

While the record for the district is being compiled all the valves in the district are inspected and those not in good condition reported to the Street Department for repairs.

When this preliminary work is finished the valves along the boundary of the district are closed; a pitometer is installed on the supply main feeding the district and the water consumed by the district is measured for a period of about seven days. From this test the average daily consumption and the consumption during the night, when the use of water is low, are determined.

If the amount of water consumed is abnormal the district is subdivided and the consumption of each subdivision measured. The subdivisions showing abnormal rates are selected and tested as follows:

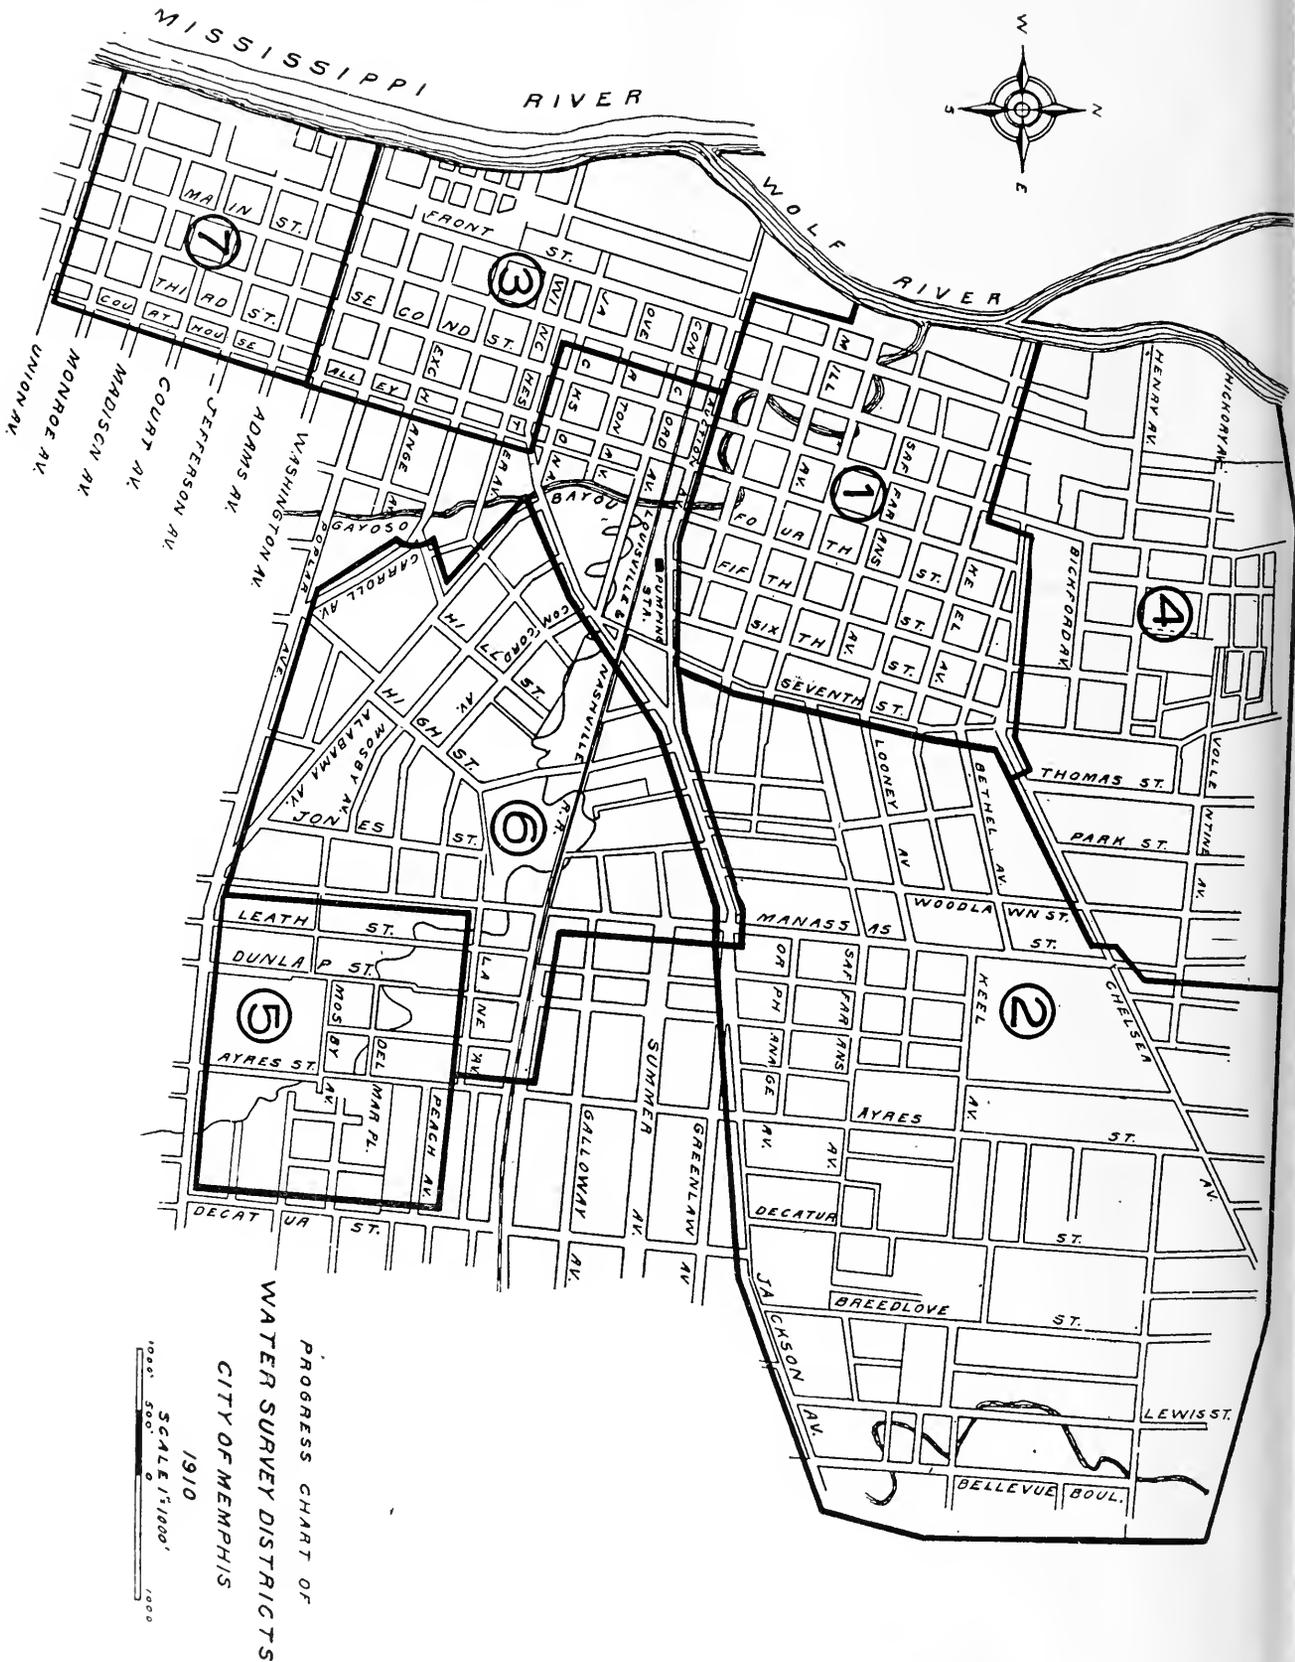

A pitometer is put in operation on a supply main feeding the sub-district, with the boundary valves closed. The area is then narrowed down in successive steps by closing the interior valves and opening the boundary valves. In this manner sections are cut off until the smallest division is reached. As each section is cut off a simultaneous drop in the flow is indicated by the pitometer. The drop or amount of decrease in

the flow is the volume of water used by the portion cut off. By this means the unaccounted-for consumption is located between valves. These tests are made between the hours of 1 and 5 a. m., for at that time the consumption is at a minimum and the rate of flow usually nearly constant.

The sections using the unaccounted-for amount are inspected by testing out each connection with the water phone. This

enables the inspector to detect any leaks, whether in fixtures or in the service pipe below the surface. He is also, very often, able to detect leaks in the main in the vicinity of the connection being inspected.

Where leaks are found within property lines the owners are given notice to make repairs. Other leaks located are reported to the Street Department. After repairs are made the sub-

PORTION OF MEMPHIS, TENN., COVERED BY PITOMETER SURVEY

district is again tested at night, and if the unaccounted for consumption is still large enough to justify it, the main is uncovered in different places until the source of waste is located.

After each sub-district is tested in this manner and all leaks that can be located are repaired, the consumption of the entire district is again measured for a period of several days to determine the amount of water saved.

The principal sources of leakage found may be briefly described as follows:

- Wrought iron supply pipes.
- Service pipes.
- House fixtures.
- Fire hydrants.
- Flush tanks.

It was apparent soon after the beginning of the work of inspection that the sewer flush tanks were, in almost every instance, wasting water, some more than others. After the inspection of the first six districts the department decided to have all the tanks in the city inspected at once, and employed men for that purpose, under the direction of the secretary of the department. Up to this time 67 flush tanks have been inspected by the pitometer division, of which nine were found discontinued and the remaining 58 wasting 106,000 gallons per day, an average of 1827 gallons per day per tank. If the remaining 307 operating tanks in the city are wasting water at the same rate, repairing them would make a saving of 561,000 gallons per day.

While the inspection of these tanks was not made by the pitometer division, the necessity for it was shown by previous inspection made by this division.

The mains were found in good condition, all the leaks located in them being joint leaks. In most cases these leaks were caused by the jarring of street cars.

A summary of the work done by the pitometer division during the year is as follows: 1170 acres were covered, in which were 34.9 miles of mains and 4132 connections. The total supply to this section was 2,526,500 gallons per day, of which 818,684 gallons were metered. In this area there were found 116 leaks on private property, 44 leaky supply pipes, 7 leaks in mains, 13 leaking valves, 21 leaking fire hydrants and 35 leaking sewer flush tanks. Stop boxes to the number of 317 were found more or less filled with dirt and were cleaned out. Seventy-four flush tanks were inspected and, as stated, nearly one-half of these were found leaking. The total reduction in consumption effected was 404,000 gallons per day, or 16 per cent of the original consumption.

The amount charged against the pitometer work was \$4251.82, which included cost of tools and the expenses of gathering the census statistics, of which there are enough on hand for the present year's work also. Valuing the water at \$40 per million gallons, the amount saved for the year was nearly \$6000, or approximately \$1700 more than the cost of the work; and a considerable percentage of the saving will extend over a number of years.

THE RED WATER PLAGUE

Effort to Determine Cause of Rust in Water Drawn from Faucets—Effect of Alum Treatment—Galvanic Action—Action on Iron Increased by Heat and Pressure—Remedies Suggested

(Abstract of a paper before the American Water Works Association, by Geo. C. Whipple.)

ACCORDING to the modern and now generally accepted theory the corrosion of iron by water and the formation of iron rust requires, first, the presence of hydrogen ions in the water, and, second, the presence of dissolved oxygen. Hydrogen ions are electrically charged atoms of hydrogen. All acids form them by dissociation. Whenever they are present in solution that solution possesses acid properties. They attack the metallic iron, which is dissolved in a ferrous condition. The oxygen dissolved in the water then oxidizes this ferrous iron and iron rust is formed. Under certain conditions this precipitates at once. Under other conditions it apparently exists in a colloidal state, with its particles electrically charged, and precipitates only when this electrical charge is neutralized. Very little is known about this phenomenon. Certain substances tend to prevent the precipitation of colloids. Thus, peaty organic matter tends to prevent the precipitation of iron.

Iron has a natural tendency to dissolve in water, as the hydrogen ion is always present in some degree. Pure water, therefore, by its dissociation into hydrogen ions and hydroxyl ions tends to act as a weak acid. Iron will be dissolved and rust will form if oxygen is present. Whatever increases the number of hydrogen ions in water increases its corrosive power. Acids do this to a marked degree. Whatever decreases the hydrogen ions reduces the corrosive power. Alkalis do this.

A further conception of the phenomenon of iron rusting is that often referred to as "the electrolytic theory of corrosion." According to this theory a sort of battery action takes place in the water and a current of electricity is set up between the metallic iron at one spot and some other metal or some impurity in the iron at some other neighboring spot. This action demands that the water be to some extent a conductor of electricity—that is, it must contain electrically charged ions—and the higher the conductivity the greater will be the current. The result of this action is that the hydrogen ions give up their charge of electricity to the iron, which goes into solution, while gaseous hydrogen collects on the surface of the metal. As this gaseous hydrogen is a non-conductor, the iron becomes

covered with a film of hydrogen, or is polarized, so that after a time the action tends to cease. Whatever removes the hydrogen from the metal depolarizes it and causes the action to continue. The presence of oxygen in water does this, as it unites with the hydrogen to form water. A circulation of water containing oxygen, whether brought about by mechanical agitation or by thermal currents also tends to remove the hydrogen. Oxygen, therefore, aids the corrosion of iron in two ways, by depolarizing it and by oxidizing the iron that goes into solution.

The presence of other metals also affects the corrosion of iron by increasing the difference of potential, and therefore the strength of the electrical currents. This is termed galvanic action. The metals act differently in regard to the direction of the electrical currents between them and iron. Some cause the positive current to flow toward the iron and some away from it—that is, some hasten the corrosion of iron and some retard it.

The common metals are arranged in the following order of what is called the potential series: Aluminum, manganese, zinc, iron, nickel, tin, lead, hydrogen, copper. Each metal tends to protect the other metals in the series below it from going into solution, but in doing so it itself tends to dissolve. Thus, zinc protects iron. On the other hand, copper acts in an opposite way, and increases the solution of iron. With two metals present, whatever increases the electrical conductivity of the water increases the corrosion of one metal or the other. Substances that when dissolved in water carry a charge of electricity and thus increase its conductivity are termed electrolytes. A typical example of this is sodium chloride. Electrolysis is an important element in various water-works problems, as the members of this association well know.

CLASSIFICATION OF WATERS

The water supplies with which the "red water plague" has been observed may be classified as follows:

Class 1.—Very soft ground waters.

Class 2.—Waters in which the chlorides or the free carbonic acid are high as compared with the alkalinity.

Class 3.—Very soft surface waters which are relatively high in color and contain peaty, organic matter and free carbonic acid.

Class 4.—Relatively soft waters, especially high-colored waters, with which sulphate of alumina is used as a coagulant, but which are not overdosed so far as the alkalinity is concerned.

Class 5.—Waters overdosed with sulphate of alumina so as to render them acid.

Class 6.—Waters containing originally excessive amounts of iron.

Soft Ground Waters.

Some of the ground water supplies on Long Island are troubled with rusty hot water. These waters are invariably soft. In some cases the chlorine is rather high, varying from 10 to 25 parts per million. The dissolved carbonic acid is also high and dissolved oxygen is present. Other waters on Long Island taken from neighboring wells and similar in character, except that the hardness is high, may cause little or no rusty water. In some oxygen is lacking.

The water supply of Far Rockaway is a ground water, aerated and filtered through a sand filter to remove the iron. The process is extremely successful and the filtered water rarely contains more than 0.1 part per million of iron; often none. The chlorine in the water is generally about 7.0 parts per million. The hardness varies from 12 to 15 and the alkalinity from 7 to 12 parts per million. The amount of carbonic acid in the filtered water is presumably low on account of the aeration. A number of instances of rusty hot water have occurred with this supply.

The ground water supply of Garden City, L. I., is somewhat troubled with rusty water. At the Garden City Hotel the marble bowls in the toilet room are at times stained beneath the hot-water faucets, no stains being found, however, under the cold-water faucets. On May 23, 1910, samples of hot water and cold water collected at this hotel were analyzed by Milville C. Whipple, with the following results:

	Parts per Million.	
	Cold water.	Hot water.
Temperature	80° F.	102° F.
Color	0	9.0
Chlorine	11.5	12.0
Hardness	27.0	27.0
Alkalinity	5.5
Carbonic acid	28.0	29.0
Dissolved oxygen	9.34	8.02
Nitrates	2.90	2.80
Iron	0.20	0.30

For purposes of comparison, the following analyses of samples of water collected Oct. 29, 1909, at Flatbush, L. I., also supplied with ground water, are given below. This supply gives no trouble from rusty hot water.

	Parts per Million.	
	Cold water.	Hot water.
Turbidity	0	0
Color	0	10.0
Chlorine	22.5	23.5
Hardness	146.0	146.0
Alkalinity	94.0	94.0
Free carbonic acid	12.0	8.5
Dissolved oxygen	5.6	3.7
Nitrates	5.5	5.5
Iron	0.2	1.1

It will be seen that this water contains more chlorine but somewhat less dissolved oxygen and carbonic acid than the Garden City water. The water is hard. It will be noticed that the amount of iron in the hot water was about five times as large as that in the cold water and was much larger than was found in the hot water at Garden City, yet the Flatbush water does not give any precipitation of iron rust when the water is heated. This may be due to the protective action of the carbonates producing the high alkalinity.

Waters in Which the Chlorides are High but the Carbonates Low.

Many waters of this class exist along the East Atlantic Coast. As an example, the water supply of a village a few miles north of Camden may be referred to. An analysis of this water, made on April 18, 1905, showed that the chlorine was high but that the carbonates were low. The water as taken from the wells contained an insignificant amount of iron, but the water in the houses was at times more or less rusty.

The water supply of Oswego, N. Y., is taken from the Oswego River. It is very hard and very saline, as the river drains the Syracuse salt-deposit region. Although the river water contained comparatively little iron, the tap water was often very rusty, both hot and cold. This rusty condition of the cold water as well as the hot water seems to be somewhat characteristic of this class of supplies and serves to separate them from the soft waters in which the corrosion is found chiefly with the hot water. Water supplies of beach hotels, being located near the seacoast, are not infrequently affected in this way.

Soft Colored Waters.

It is a well-known fact that soft surface waters corrode the metals used for service pipes. This matter has long received attention in connection with the subject of lead poisoning. The soft, peaty water supplies obtained from the English moorlands act on lead pipe, sometimes to a serious extent. In a number of English cities, such as Birmingham, Sheffield and elsewhere, lime is added to the water to prevent injury to the public health from lead poisoning and to avoid the inconveniences attending the corrosion of other metals.

In a recent paper presented to the Institute of Civil Engineers of Ireland, by W. Kays-Parry, an account is given of the corrosive effects of the Vartry supply of Dublin. The author says:

We all know by experience that since the Vartry water was introduced into Dublin it has become necessary to discard both iron boilers and iron pipe for hot-water supply, owing to the destructive action of the water on the iron. A galvanized-iron cylinder in which hot water is stored is very soon perforated, and for this reason copper cylinders are now almost always used.

This action it is claimed by Dr. Adeney is "due to the presence of minute quantities of peaty matter which undergoes slow fermentation with the formation of carbonic acid as well as small quantities of nitric acid."

In 1900 Clark and Forbes, chemists of the Massachusetts State Board of Health, published a report on the corrosion of service pipes in which the effect of dissolved carbonic acid was found to be of controlling importance. The action was found especially severe when the carbonic acid was high and the water soft.

In many New England cities supplied with soft surface water experience has led to a very general use of brass and lead pipe for hot-water service, and iron pipes have been avoided. Occasionally in recent years trouble has been experienced where galvanized-iron or steel pipes have been substituted. This has been the case in Springfield, Mass., where rusty water troubles have occurred to an increasing extent during the last few years.

Conversely, it is also a fact that in localities where the public water supplies are hard galvanized-iron and steel pipes have been satisfactorily used for hot-water supplies instead of brass. This is true of London, where the water supply is hard, whereas in the cities of Middle England, where the water supplies are softer, such pipe is avoided.

Soft Waters Treated with Alum, but Not Overdosed.

It is to the waters of this class especially that the attention of engineers has been drawn during the last few years, not only because of the seriousness of the rusty water troubles that have occurred, but because, as a result of them, there has been growing up a prejudice against the use of alum as a

coagulant. It should be said at the outset that such an inference should not be too hastily drawn, but judgment should be reserved until the matter has been considered broadly in all its aspects.

One of the instances with which the writer is most familiar is that of the red water plague at Watertown, N. Y., which has occurred since the introduction of a mechanical filter in 1905. The supply of this city is taken from the Black River. The water is an especially difficult one to treat, partly because of its high color, partly because it contains organic matter resulting from the pollution of the river by the wastes of pulp mills and partly because of its relatively low and variable alkalinity. On account of the high color and the fluctuations in the amount of organic matter and alkalinity that suddenly occur without warning, it is necessary to apply rather large amounts of sulphate of alumina. The following figures will serve to give an idea of the character of the water treated and the amount of alum that has been used:

AVERAGE COLOR AND ALKALINITY OF THE RAW AND FILTERED WATER AT WATERTOWN, N. Y., AND THE QUANTITY OF ALUM USED

Year.	Color.		Alkalinity.		Quantity of alum used, grains per gallon.
	Raw water.	Filtered water.	Raw water.	Filtered water.	
1905.....	69	10	39	19	2.97
1906.....	62	9	39	22	2.00
1907.....	69	6	28	12	2.53
1908.....	65	7	31	14	2.34
1909.....	67	8	30	12	2.23
1910.....	70	12	28	10	2.30

TYPICAL ANALYSIS OF WATERTOWN WATER

	Parts per Million.	
	Raw water.	Filtered water.
Turbidity	5	0
Color	78	4
Nitrogen as albuminoid ammonia..	0.204	0.126
Nitrogen as free ammonia.....	0.036	0.018
Nitrogen as nitrites	0.004	0.003
Nitrogen as nitrates	0.150	0.120
Oxygen consumed, 5 min.....	13.00	6.40
Total hardness	37.50	39.00
Alkalinity	33.00	15.00
Incrustants	4.50	24.00
Chlorine	0.50	0.50
Iron	1.10	0.30

Not long after the filter was put into service complaints arose throughout the city that many of the copper-lined water-socket tanks were giving out through corrosion. This appeared to be due in part to a slightly increased conductivity of the water resulting from the alum treatment, but also to the fact that the filtered water was much clearer than the raw river water that has been previously used, so that the tanks, instead of being covered with a thick layer of slime, as they had been, were cleaner and there was greater exposure of the metal to the circulating water, a condition favoring corrosion through galvanic action. At the same time it was also found that the hot water in many of the houses was becoming rusty—so much so that in various instances the water was too dirty to be used for bathing. This was not generally true throughout the city, but was noticed more in some places than in others, being especially troublesome in some houses of recent construction. A study of the matter at this time showed that the water from the filter as it left the plant contained from 0.05 to 0.2 parts per million of iron and that the cold water in the city contained 0.15 to 0.35. Such an increase in the amount of iron in water passing through the city mains is not an unusual one.

Further evidence that the corrosion of the city mains was not serious was obtained by flushing various hydrants throughout the city. The amount of rusty water drawn at such times was found to be not much greater than that normally observed.

When samples of hot water were compared with samples of cold water, however, it was found that in almost every case the hot water was more highly colored and contained more iron than the cold water. Thus, in May, 1908, hot-water samples

were found to have colors between 50 and 300, while, at the same time, the water as it left the filter plant and as it flowed from the cold-water taps had a color of less than 5. In some instances the iron came from the hot-water faucets as flakes of rust that would settle in a tumbler and cause a thick, reddish deposit on the bottom.

The red water plague was particularly severe during the winter of 1907-1908 at a time when the amount of alum used was rather large and when the alkalinity of the filtered water was low. It should be noted here that the application of the alum to the water at the Watertown filter is watched with great care. The plant is in charge of a chemist and samples of raw and filtered water are collected and analyzed four times each day, and have been ever since the plant was started. These analyses show that the filtered water has always been alkaline to methyl orange or erythrosens. At times, when the alkalinity of the raw water has been low, it has been necessary to use soda ash in order to provide alkalinity for the decomposition of the alum.

These same rusty hot-water phenomena have been observed in many other places besides Watertown. The water supply obtained from the Passaic River at Little Falls and supplied to Paterson, Passaic, Montclair and other places has been the cause of more or less trouble of this character. Here also the water is relatively soft and somewhat colored and is filtered through a mechanical filter, using alum as the coagulant. At Burlington, Vt., some complaints have been made of rusty hot water. The supply is taken from Lake Champlain and filtered through a mechanical filter, using alum as the coagulant. At Charleston, S. C., the red-water plague has existed for a number of years and frequently has been serious. The supply is taken from a shallow storage reservoir on Goose Creek and filtered through a mechanical filter. The water is soft and lime is used as well as alum. Here the red-water plague is said to have existed even before the use of alum.

A more recent instance of the red-water plague is that which occurred at Springfield, Mass., in the spring of 1910. This trouble is said to have begun several years before this, when the supply of the city was taken from the Ludlow reservoir. It became somewhat more serious after the new supply from the Little River was put in service. This water passes through a sand filter before being delivered to the city. At times the raw water is rather high colored and, in order to reduce this, alum is used at times in connection with the filter. The water is extremely soft. Alum was applied to the water in small quantities between April 30 and May 18, 1910, and soda ash was applied between May 6 and May 15. Between May 18 and July 15 no coagulants were applied. During this time, even when no chemicals were being used, the rusty water troubles became serious and a detailed study of the matter was made by the Chief Engineer of the Waterworks Department, Mr. Elbert E. Lochridge, and the writer.

It was found that the trouble was worst in certain apartment houses of recent construction, although a slight trouble was general throughout the city. The color of the hot water in apartment houses varied all the way from 50 to 400, whereas the color of the cold water at the same time ranged from 25 to 45. The hot water also contained large amounts of rust sediment which, on analysis, was found to be composed almost entirely of oxide of iron. Iron was also present in solution or as a colloid. This caused red stains of iron rust on white porcelain basins and in many cases made the water practically useless for all domestic purposes. It caused pipes to become choked and in one case is said to have resulted in the bursting of a boiler.

The boilers used were generally made of cast iron, although in the case of one or two large installations steel boilers were found. The tanks were sometimes galvanized iron or steel, sometimes made of steel blackened on the outside and apparently with no protective coat on the inside. Their capacities varied from 100 to 500 gallons. In practically every case where trouble was observed the water passed through one of these unprotected steel tanks.

It was found that the rusty water troubles were associated with the steel tanks and galvanized pipes of poor quality, and an investigation was made to ascertain the character of the inside of some of the galvanized piping used in Springfield. Samples were obtained from various plumbers and dealers, from the stock of pipe in the water-works yard, and from pipes used in other cities. These samples were sawn asunder so as to expose the interior. The results, taken as a whole, showed extremely bad conditions. Scarcely a single specimen of a perfect pipe was obtained. In some cases there were large areas of the interior of the pipe entirely uncoated with zinc, and where the steel was exposed and coated with rust others were spotted with pieces of mill scale embedded in the zinc coating; others were rough from the presence of dross from the spelter bath; sometimes a line was found along the seam where the coating had not adhered to the pipe, possibly on account of the failure of the acid to remove the mill scale during process of galvanizing. In several pipes where the coating was good, so far as the eye could see, microscopical and chemical tests showed the presence of pinholes where rusting might occur. In some instances a poor coating of zinc on the inside was accompanied by a poor appearance of the outside coating, but the sample as a whole showed that it was not always possible to tell the nature of the inside pipe from the appearance of the outside. A number of samples of galvanized-iron pipe obtained from different dealers and plumbers, from the water department stock and elsewhere were carefully examined both on the outside and inside, the specimens being sawn in two for that purpose. The physical appearance of the coating was first recorded, after which the specimens were examined with the microscope and tested for porosity by means of Walker's test and by the use of ferro-cyanide.

Walker's test was made as follows: The raw edges of the iron and bare spots were first coated with asphalt in order to protect them and then the specimens were placed in a solution of boiling caustic potash. If any iron remained exposed and in contact with the zinc, bubbles of hydrogen gas were generated and could be easily seen with the eye. In the case of many specimens this test was not necessary, as the bare, uncoated spots could be easily detected without it, but in other specimens, which to the eye appeared to be thoroughly coated, this test revealed the presence of pinholes. These might become foci of corrosion, and the beginning of tubercle formation. As corrosion proceeded such tiny bare spots would increase in size until finally a large area was exposed. No specimen was examined that did not show at least one or two such pinholes. The character of the coating on the outside did not always indicate the character of the coating on the inside; that is to say, a good exterior did not necessarily mean a good interior. A bad exterior, however, was invariably accompanied by a bad interior.

Water Overdosed with Alum.

It sometimes happens with mechanical filter plants that more alum is used than can be decomposed by the alkalinity naturally present in the water. When this occurs the filtered water becomes acid and its corrosive powers are greatly increased. Such waters are liable to be the cause of the rusting of iron and steel pipes, tanks, etc., with both cold and hot water. Instances of this kind have not infrequently come to the attention of the writer. One of these was at Athol, Mass., where the supply was taken from a small reservoir and was treated with alum and filtered through a pressure filter before passing to the city. On account of irregular application of the chemical the filtered water was intermittently acid.

Other and very common instances of this overdosing have occurred in New York City and elsewhere, in connection with the use of small house filters where alum is used as a coagulant. These filters are widely used by hotels and apartment houses of the better class. They are commonly provided with a device for applying alum to the water before filtration. Usually the alum control is very imperfect at best and very poorly looked after, and the result is that the water is not infrequently overcharged with alum.

In order to correct any misapprehension in regard to mechanical filtration, it should be stated that mechanical filters with alum used as a coagulant have been in service for many years in many cities of this country, without being the cause of any red-water plague. But where this is the case the waters are relatively hard and the filtered water has a considerable residual alkalinity. The writer has corresponded with many engineers and chemists in various cities where mechanical filters have been used, and the dividing line between those which have caused trouble and those which have not appeared to be sharply drawn according to the hardness of the water; that is to say, the use of alum with hard water causes no trouble, whereas the use of alum with soft waters may cause serious trouble.

Water Naturally Charged With Iron.

Many public water supplies contain excessive amounts of iron and with these rusty water is common, both cold and hot. At Far Rockaway, N. Y.; Red Bank, N. J.; Superior, Wis.; Reading, Mass., and elsewhere filter plants have been constructed for removing iron. Methods of deferrization have been well described by Weston (Trans. A. S. C. E., Vol. 64, September, 1909).

SEASONAL OCCURRENCE

It is difficult to state any particular time of the year when the red water troubles are at their maximum, but, generally speaking, so far as the observation of the writer has gone, the fall and winter months are the worst. This appears to be due in part to the fact that during the winter the hot water is maintained at a higher temperature and for more hours in the day than during the summer, when it is not uncommon to allow the range fire to go out at night. In winter also surface waters contain more dissolved oxygen. Another, and perhaps a more important cause, is the fact that organic matter freshly dissolved in water appears to be more corrosive than organic matter that has passed through various stages of fermentation. The seasonal distribution of coloring matter in water differs in different localities. An increase in color usually occurs during the late fall and early winter, after the leaves have fallen. The maximum color, however, is more commonly observed during the months of May and June, after the spring rains have caused the swamp lands to discharge their waters. In some instances it is said that the hot water is more rusty at the time of this maximum color of the early summer. In other cases, the winter maximum of color, caused by freshly dissolved organic matter, gives rise to the worst conditions.

LOCALIZATION OF RED-WATER TROUBLES

Wherever the red-water plague has been observed a most conspicuous phenomenon has been that the rusty hot water has not been general throughout the city, but has differed greatly in different houses. Often many houses are practically exempt, while neighboring houses may be seriously affected. This was conspicuously true in one instance in Springfield, Mass., where there were two apartment houses on the same street taking water from the same mains under identically the same conditions and with the plumbing arranged in substantially the same way. In one of these apartment houses no trouble was experienced, while in the other the conditions were very bad. The only noticeable difference between these two buildings appeared to be in the character of the material used for the construction of the heaters, tanks and piping used for the hot water services.

If one were to generalize, it may be said that it has usually been found that houses recently built have suffered more severely than older houses; that houses in which brass pipe and copper boilers have been used have suffered little or none at all; that houses in which galvanized wrought iron or steel pipe have been used have been the ones affected and those in which the piping has been apparently of poor quality have suffered the worst. The troubles have been somewhat more marked in buildings where the circulating pressure system is used than in those where the tank system is used, but exceptions have been found, as, for instance, in tall buildings. In short, the

physical conditions that appear to favor the formation of iron rust in hot water are higher pressure, higher temperatures and greater circulation.

In any particular house, differences are noticed in different parts. The water supplied to the lower floors of high buildings is often slightly more discolored than the water supplied to the upper floors, but this difference is not always noticed. When pipes are examined the greatest amount of rust is found where the circulation of the water is most rapid. More is found in horizontal than in vertical pipes. Sometimes the pipes between the heater and the storage tank are very nearly, if not completely, choked with rust. Here the circulation is naturally very rapid.

TEMPORARY RUSTINESS

It is a matter of common occurrence to find the first water drawn from a hot-water faucet to be somewhat rusty, the water afterwards running clear. This may happen even in places where there is no general red-water problem. It is especially likely to happen when the water contains such electrolytes as sodium chloride. It is due to galvanic action between different metals. Thus, where brass faucets have been attached to steel pipes the writer has found the first tumblerful of water drawn to be rusty and the water afterward drawn to be clear. This temporary rustiness is often a conspicuous phenomenon where gas heaters are employed and is apparently due to the use of different metals in places where the temperature of the water is high.

SULPHATE OF ALUMINA

Carbonic acid dissolved in water increases the hydrogen ions present and therefore its corrosive properties. This acid is present in nearly all water, being high in swampy waters and many well waters. It is not driven off by heat when the water is under the pressure existing in city mains. When present in combination with the carbonates of alkaline earths it does not appear to be as corrosive as in soft waters. The effect of organic acids in the corrosion of iron is little understood, although it is generally considered that swampy waters owe their corrosive properties in part to such acids.

When sulphate of alumina is added to water that contains calcium carbonate there are formed aluminum hydrate, calcium sulphate and carbonic acid gas. The increase in the amount of free carbonic acid amounts to 6.8 parts per million for each grain per gallon of alum, assuming the original alkalinity to be in the form of bi-carbonate. Practically the reduction in alkalinity is somewhat less than the theoretical. Fuller believed this to be due to the absorption of a certain amount of sulphate of alumina by clay carried in suspension. The writer has found it to be the case with colored waters and especially with soft colored waters, and it has been found to occur with waters that have been filtered and he suggests that probably some of the alum unites chemically with the organic matter.

It is possible that where the amount of alkalinity in the raw water is very low, the alum reaction does not go to completion, but a certain small amount of aluminum sulphate remains in the water. Conductivity experiments made by Melville C. Whipple have shown that whereas the conductivity of hard water is carried by a very small amount when alum is added, the conductivity of a relatively soft water is sufficiently increased by the addition of the same amount of alum.

Under ideal conditions all of the alum added to the water before filtration is decomposed and takes the form of aluminum hydrate, which is removed by the filter, although if this is not working properly some of the hydrate may appear in the effluent. If the alum reaction should not be complete, but if a small amount of basic sulphate should be formed, it is possible that this might remain as such dissolved in the filtered water. If there is a chemical combination between the aluminum sulphate and the organic matter, it is possible that this compound might pass through the filter either in the form of a colorless solution or as a colloid. In the case of an over-

dosed water, aluminum sulphate itself is present in the filtered water.

If the filtered water should contain basic aluminum sulphate it is reasonable to believe that heating it would tend to complete the reaction so that aluminum hydrate would be precipitated in the hot water. If the filtered water contained aluminum sulphate in combination with organic matter, heating might decompose it and this also would tend to throw down the aluminum hydrate in the hot water. In this connection it is worthy of note that in Watertown analyses of the deposits in the hot-water pipes have shown considerable quantities of aluminum, sometimes as high as 7 per cent.

These changes in the basic sulphates and combinations of alum with organic matter would naturally tend to increase the hydrogen ions and therefore the corrosive properties of the water.

Experiments have shown that when alum is so added to waters the alkalinity of the filtered water is reduced to 5 or 8 parts per million, the filtered water, after long boiling, has an acid reaction when tested with the phenolphthalein indicator, whereas the reduction is alkaline if the residual alkalinity of filtered water as shown by the ordinary methyl orange or erythrosene test is kept higher than 5 or 8 parts per million. Many experiments along this line have been made by the writer and the results are shown in Fig. 1.

From a smooth curve drawn through these results it would appear that when the alkalinity of the filtered water falls below six parts per million the water will commonly have an acid reaction with phenolphthalein after boiling. This acidity of the hot water is apparently not due to carbonic acid.

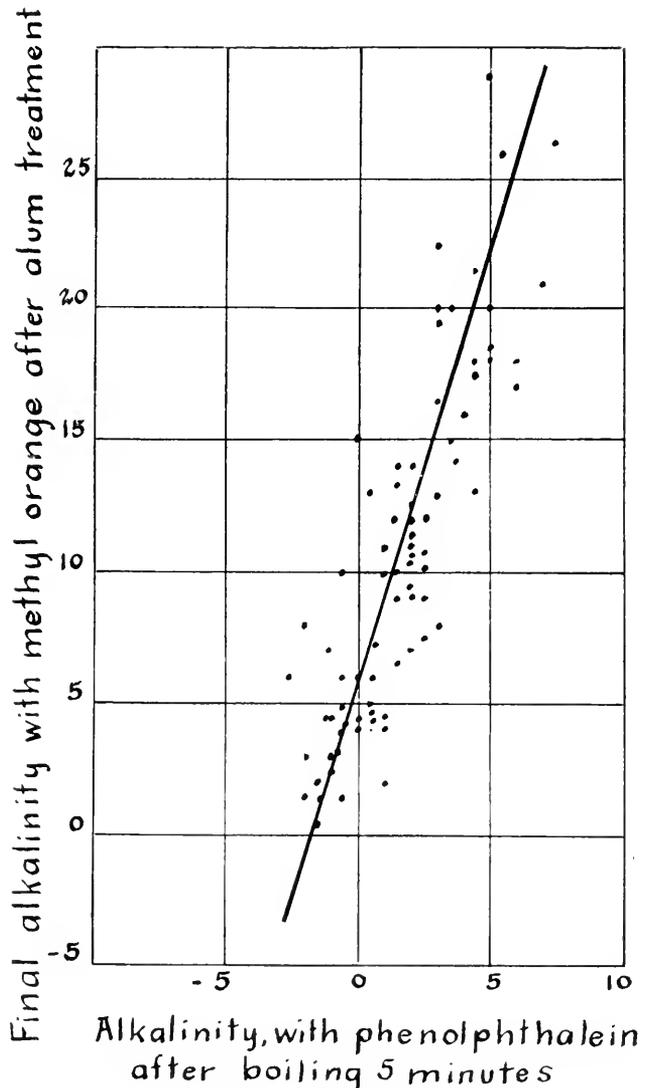

FIG. 1.—TESTS OF ALUM-TREATED WATERS

In a series of experiments made to determine the relative corrosive effects of alum-treated waters in which the residual alkalinity varied, it was found that when the residual alkalinity fell much below to parts per million the corrosive effect of the water on iron increased materially.

When waters that contain calcium carbonate are boiled a dissociation takes place, with the formation of the hydroxyl ion. These tend to neutralize the hydrogen ions and thus prevent corrosion.

Whatever may be the explanation, and the chemistry of the subject is by no means clear, the fact appears to be well established that as a result of the application of sulphate of alumina to soft, colored waters a corrosive property is imparted that acts when the water is heated, but that is insignificant as long as the water remains cold.

The theory of corrosion and rusting requires not only the presence of the hydrogen ion, but the presence of oxygen. It has been well proved that where the hydrogen ion is present the rusting of iron is proportionate to the concentration of the oxygen. The greater the amount of oxygen, therefore, the greater the rusting. Generally speaking, hot water contains more than enough oxygen to oxidize the iron dissolved and it is probable that the increased corrosion attending increased amounts of dissolved oxygen is due to its action as a depolarizer.

Surface waters used for public supplies usually contain oxygen up to their saturation point. The solubility of oxygen decreases as the temperature rises. Near the freezing point water will hold in solution about twice as much oxygen as at

summer temperatures. The solubility decreases according to a regular curve and at the boiling point becomes nil.

The solubility of oxygen is also affected by pressure and increases directly with it. Water under a pressure of two atmospheres will hold twice as much oxygen as water under a pressure of one atmosphere. The solubility of oxygen in water at different temperatures and pressures is shown in Fig. 2. When water saturated with oxygen is heated, the pressure remaining the same, oxygen gas is liberated. This is also true of the dissolved nitrogen. Experiments made in this country and also in Germany have shown that heating water increases electrolytic action between dissimilar metals in contact with such water.

Some ground waters contain little dissolved oxygen and these waters do not seriously rust pipes.

Experience has shown that the more rapid the circulation of water through a hot-water system, the greater is the rusting of the pipes, since it prevents the accumulation of hydrogen on the iron surface, that is, prevents polarization. Corrosion is also increased by the exposing of fresh surfaces due to the mechanical removal of the rust already formed. The increasing tendency to use the circulating system of hot-water distribution in houses may in part explain why the rust problem is more serious now than formerly. The circulating pipes between the heaters and boilers often become completely choked with rust when the rest of the system is much less affected.

It has been found in several cities that water in which lime has been used either for softening or in connection with copers contains normal carbonates, and acts on the zinc coatings of pipes, dissolving the zinc and exposing the iron to the water. Such water will even remove zinc from alloys, and meters and other fixtures have suffered in consequence. These waters do not corrode iron, but if, after pipes have had their zinc removed the water should change in character and no longer contain an excess of hydroxyl ions, corrosion would probably become serious.

Iron fully protected with zinc would apparently not be subject to corrosion and the red-water evil. In Springfield it was apparent that the worst red-water conditions existed in the buildings of cheaper construction where unprotected steel tanks were used. Examination of some of the pipes which were completely choked with iron rust showed them to be made of steel very badly galvanized. Experiments on the relative corrosion of wrought iron and steel pipes have been inconclusive, but so far as practical experience goes it appears that the best results are obtained by using the best grades of wrought iron. However, the better grades of steel pipe are probably more satisfactory than the poorer grades of wrought iron. But probably the most important thing is the thoroughness of galvanizing.

For the best protection pure zinc should be used, and not an alloy. It should be of sufficient thickness and applied so as to thoroughly cover the pipe at all points. If the mill scale is not properly cleaned from the pipe; if the acid used in pickling is not thoroughly washed off; if the temperatures of pipe and zinc are not right; if the zinc bath is used too long, so that dross accumulates in the dipping tank; and if other precautions are not taken the galvanized coating will not be satisfactory. In the course of inspection of many pipes taken from buildings and found in the shops of plumbers it has been often noticed that the galvanized coating is very imperfect. Unfortunately minute openings in the zinc coating are apt to be present even when the galvanizing is carried on in the best possible manner.

REMEDIES

If the above-mentioned theories of corrosion are correct, the logical methods to be used for preventing rusty hot water would be along the lines of reducing the hydrogen ions in the water or increasing the hydroxyl ions, getting rid of the dissolved oxygen, reducing the pressure, temperature and circulation, and using pipes of good quality selected with refer-

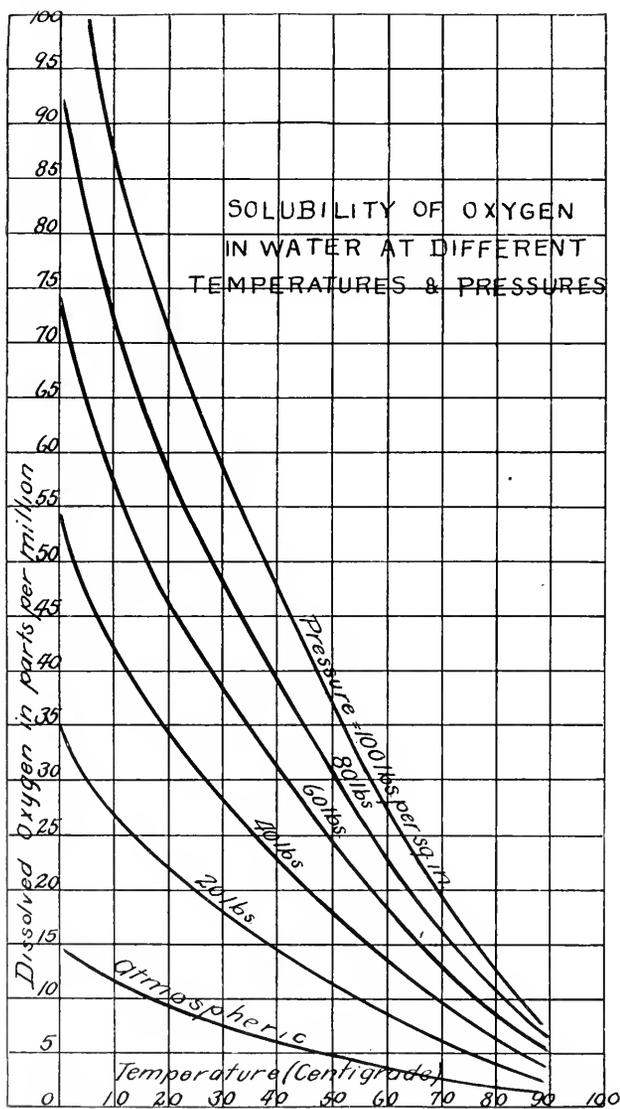

FIG. 2.—SOLUBILITY OF OXYGEN AT DIFFERENT TEMPERATURES

ence to the nature of the water. Practice can follow theory to a certain extent.

There seems to be no doubt that the most effective method of avoiding rusty hot water is to use brass or some metal other than iron or steel for the hot-water pipes and boilers. This increases the expense of the installation, but with very soft waters it is advisable. If brass is used it should be properly alloyed and well annealed, proper fittings also should be used.

If wrought-iron or steel pipes are used they should be of the best quality and should be well protected by a galvanized coating of pure zinc applied by the dipping method. Experience appears to indicate that wrought-iron pipes of the best grade resist corrosion better than steel pipes, but so many exceptions have been found to this that it cannot be considered as definitely established. Poor grades of both steel and iron pipe are to be avoided. A vigorous reform should be instituted in the manufacture and methods of branding and sale of smaller sized pipe for use with hot water.

In domestic hot-water supplies it is not feasible to prevent circulation of the water in the pipes, nor is this desirable, as the circulating system possesses a number of distinct advantages. The pressure of the hot water must depend chiefly upon practical physical conditions, but in designing a system where red-water troubles are feared, low pressure should be favored. There seems to be no doubt that in many cases the temperature of the hot-water supply is maintained higher than is necessary for domestic uses, and in such cases the red-water plague could be materially alleviated if means were taken to prevent excessive heating.

Neither is it feasible nor desirable to remove the dissolved oxygen from a public water supply as has been recommended for the Coolgardie supply in Australia. It is sometimes done in the case of water used for boiler purposes and the results are said to be beneficial. There is no reason why it could not be done for hot-water installations in large buildings, as in apartments, hotels and office buildings, where large numbers of taps are supplied from a common source. By first heating the water to a rather high degree, say 80 degrees to 90 degrees Centigrade, and then carrying it to an open tank at the top of its building a large amount of the dissolved oxygen would be liberated and its corrosive power materially diminished. A more complete removal might be obtained by the use of a closed storage tank with a partial vacuum.

The most effective method of preventing rusty hot water, next to the avoidance of iron and steel pipe, is to reduce the hydrogen ions in the hot water to a minimum or, what amounts to the same thing, to increase the relative number of hydroxyl ions. This practically amounts to saying that the public water supply should not be too soft. Experience seems to indicate that the alkalinity should be at least 10 or 15 parts per million. The higher the alkalinity the less danger of rusty hot water. But it must be remembered that the hardness of water is in itself objectionable and that when it is more than 15 or 25 parts per million it begins to have a noticeable effect on the use of soap.

Public water supplies high in organic matter and low in alkalinity may be advantageously hardened by the addition of a small quantity of lime, say 10 or 15 parts per million. This practice has long been common in England.

The use of alum with soft, colored waters should be avoided as far as possible, but if it is employed lime (or soda) should be used with the alum in order to prevent the alkalinity from falling too low. But here again is a difficulty, for when deeply stained waters are decolorized with alum it is found that the additional use of lime and soda prevents to some extent the satisfactory decolorization of the water. In such cases considerable care must be used in adjusting the chemicals, and in the present state of the art it is not always possible to obtain entirely satisfactory results. The problem of color removal for soft waters has not yet been satisfactorily solved.

With hard waters practically no precautions are necessary to

be taken, as the hardness itself seems to be sufficient to prevent rusty water troubles.

Finally, it is evident that the problem of rusty hot water is a complicated one. Its solution demands the united efforts of water works engineers, plumbers and pipe manufacturers. Economy to the householder demands that the quality of a public water supply be considered not alone from the hygienic standpoint, but from its possible influence on pipes and fixtures, and that, on the other hand, the materials used for distributing the water be chosen with reference to the inherent qualities of the naturally available supply. Plumbing regulations should be drawn with this in mind. But all these precautions will be of no avail if pipes of satisfactory quality cannot be obtained and recognized by the ordinary dealer and plumber. To this end two things are necessary, properly drawn specifications and a simple method of branding.

ILLINOIS WATER SURVEY

A BILL has just been signed by the Governor of Illinois adding to the duties of the State Water Survey an inspection of the water sheds of all of the municipal supplies of the state, making such field studies and collecting such samples as are necessary; also "To analyze and test samples and to make any investigations to the end that a pure and adequate public water supply for domestic and manufacturing purposes may be maintained in each municipality; to make sanitary analysis free of charge of samples of water from municipal water supplies or from private wells collected according to the direction of the State Water Survey; and to report the result of such examination to the Board of Health, Superintendent of Water Works, or other officer or officers of the water department of the city, village or incorporated town, or to citizens by whom the samples, respectively, were collected." The bill provides for an annual appropriation of \$15,000 for the salaries of the assistants and employees and for the expenses of this work. The Survey is directed to publish an annual report and such special reports as may be necessary. The University of Illinois was practically constituted the State Water Survey when it was originally established, Professor Edward Bartow being the director of the Survey.

MULTIPLE FILTRATION

In a paper read last month before the Association of Water Engineers of England, Walter Clemence referred to the increasing number of slow sand filtration plants in which the water receives as preliminary treatment either clarification in settling tanks or storage reservoirs, or precipitation with coagulants. Each of these methods is expensive, the coagulant is liable to cause clogging of the filter, as are also algae and other micro-organisms which form in many of the storage reservoirs or basins used as settling tanks. Reference is made to the London water supply, of which Dr. Houston states that at certain times the life of the filter beds treating stored water is reduced to a few days only, because of the large quantities of algae growing therein.

In place of precipitation, coagulation or storage Mr. Clemence advocates multiple filtration. The principle of this, he states, is founded on the idea that the formation of a film or schmutzdecke, either natural or artificial, on the surface of the filtering medium is neither necessary nor desirable. In this multiple filtration the coarse prefilters are so operated that chemical purification and bacterial reduction are effected to such a degree that no schmutzdecke is formed on the final filter. Meantime the water is exposed to the air in fountains or cascades in passing from one filter to the other and the aeration thus effected results in a partial replacing of the dissolved oxygen which had been lost in passing through the preliminary filters.

He suggests that should this absence of the film from the final, finest grained filter result in lowered efficiency of bacterial removal, sterilization by hypochlorite, ozone, ultra-violet rays or other modern methods might be necessary or at least advisable.

WATER WORKS NOTES

The superintendent of the Bradford, Pa., water department, S. D. Hefner, reports that on Jan. 1, 1911, a satisfactory reduction in their fire insurance rates was made by the fire insurance companies on all properties in the city, in accordance with an agreement with the underwriters made some time ago. This agreement was that if the city would erect a good and substantial pumping plant within the city limits and maintain it ready for instant use at all times as an auxiliary to the gravity system, the insurance rates would be lowered. A reduction has accordingly been made of from 25 to 50 per cent. in the insurance rates.

The same city also reports that the use of fire hydrants by sprinkling carts continues to be a nuisance of the worst kind "not only to the water department but to the public generally as well, by stirring up the sediment in the mains and thereby causing roily water." There are a number of most serious objections to the use of fire hydrants by sprinkling carts, but we do not remember having heard this one before. If the mains are so filled with sediment as this report would apparently indicate it seems to us that the department should blow off all the fire hydrants at frequent intervals, whenever there is sufficient water to render this expedient and thus remove the real cause of the roily water.

Summerville, Mass., had on Dec. 31, 1910, 12,149 service connections and 5,810 meters. Water Commissioner Frank E. Merrill in his annual report states that, although \$4,632.73 was spent during the year in installing meters, almost the whole of this amount was saved in the reduction of waste for that year alone. In this case the saving in consumption is an actual saving in dollars and cents and one which can be exactly computed, since the city obtains its supply from the Metropolitan system and pays the State commission by meter for the water consumed.

Of the 5,810 meters, 228, or about 4 per cent. of the entire installation, were found out of order during the year and repairs to the same made in the department repair shop. The defects found are classified as follows: Broken disks, 38; defective registers, 15; defective gear trains, 47; freezing, 46; hot water, 5; dirt, sedimentation and similar obstructions, 42; miscellaneous defects in gears, spindles, screens, etc., inside the meters, 23; noisy meters, 12.

Probably owing to a considerable extent to the introduction of a new water supply under a somewhat higher pressure than the old, the city of Springfield, Mass., suffered from a considerable number of leaks during the year 1910. Altogether there were 76 leaks in the mains, an average of 0.41 per mile of main pipe in use. Two of these were somewhat unusual. In March a 24-inch by 8-inch reducer blew out, causing a flooding of cellars in the vicinity, breaking a 12-inch gas main and a street railway wire duct, filling the gas mains and wire ducts with water and sand and doing much other damage. Fortunately, a number of teams and automobiles were immediately available and the necessary gates were closed in less than half an hour. The peculiar feature was that the reducer which was blown off could not be found and Superintendent Alfred E. Martin reports his belief that it evidently had sunk into the quicksand which is found quite generally in that vicinity, having entirely disappeared from sight before the hole was cleared of water. Fortunately, another was found at Hartford which could be obtained at once and was got on the ground so quickly that the repairs were completed the next day.

Another serious break occurred on the afternoon of July 4, a hole about 6 inches in diameter being blown out of the side of an 8-inch cement-lined main, forcing a stream of water out of the ground at an angle of about 45 degrees and completely deluging a dwelling house on the south side of the street, injuring the house badly and ruining much of the furniture and clothing of the tenants. The house was literally bombarded with trap rock and sand, all the front windows were broken, clapboards and shingles were torn off and the front room floors were covered to a depth of 3 to 4 inches with sand and gravel.

PUBLIC WORKS NOTES OF READING, PA.

In his report for the year 1910, city engineer Edmond B. Ulrich, of Reading, Pa., calls attention to the inconvenience of having the fiscal year begin on April 1st, with the new appropriations taking effect at the same time; since, although they take effect then, there is no actual money available for expenditure before the middle of June or the first of July. "In making this statement recognition is taken of the fact that there is always some money left from the previous year through unexpended appropriation and accumulations of some amount in different general funds. This lack of money for a period of nearly three months is a serious set back to all our construction work especially on highways, as it thus leaves but about 5½ months before the opening of the next winter, and all our construction and repair work must be done in this time. . . . Where laws relative to the beginning of the fiscal year and the collection of taxes are not beneficial to conditions as they exist, such laws should be amended to be made so."

STREET OBSTRUCTION BY BUILDING MATERIAL

The piling of building material directly upon paved streets is considered a nuisance by the city engineer, and he recommends legislation requiring that proper receptacles be constructed in which all building materials should be kept until used, or excavated and worthless material stored until carted away. "The object is to prevent the disagreeable sight of sand, loam, plaster, stone chips, wood and other materials being scattered over the square through various causes—by wheels of teams, water flowing in gutters, wind or rain, and also to avoid the additional wear of the pavement due to the grinding action of the wheels of each wagon as it goes over the scattered material."

SIDEWALK GUTTERS

The method in vogue in Reading, of conducting storm and waste water over the sidewalk surface by means of shallow gutters from building to curb line is considered objectionable and it is recommended that it should be prohibited as being both unsanitary, unsightly and dangerous to pedestrians, especially in winter. All water which it is necessary to carry from the building to the gutter should, it is believed, be carried through pipe drains placed under the sidewalk.

STREET CLEANING

A contract has been let by the city for cleaning the paved streets for a term of years ending June 6, 1911. On March 2, 1910, however, the contractor abandoned his contract without previous warning. On the following day the city, having decided to complete the term of the contract with its own forces, ordered the necessary equipment and on March 4 had 15 men at work sweeping the dirt into piles near the curb lines of the streets, to be later carted away in wagons. This was adopted as a temporary expedient only until the arrival of the carts, shovels, brooms and other equipment. When these had arrived each cleaner, who has been assigned to one of the 24 districts, was equipped with a broom, shovel, scraper (if there were asphalt streets in his section), either three or four cans and a can carrier, to which was added a pick during winter months.

The cans were made from No. 18 steel sheets and were 19 inches in diameter at top, 15¼ inches at the bottom and 23 inches deep, each can holding 3 cubic feet of sweepings. These cans are filled in succession and then placed at a designated spot in each district, from which points they are removed by the street cleaning wagons, of which there are three. The brooms employed were 20-inch bass and lasted an average of 48 days. The shovels lasted an average of 4½ months. The cost during the ten months of operation was \$7.88 per square for cleaning and 43 cents for flushing, or a total of \$8.31. The contract price had been \$7.59. The total amounts expended for cleaning during the ten months were as follows: Foreman, \$807; labor, \$9,720.29; teams, \$3,151.36, and for flushing labor, \$399.70, and for flushing cart, \$207.13. The regular cleaning force consisted of one foreman, 24 district cleaners and three teams.

Water Works Rate Making

There would seem to be some significance in the fact that two of the most important papers delivered before the American Water Works Association last week dealt with the subjects of rates for water and for fire protection. Mr. Earl makes a plea for water rates established upon a foundation of facts and reason rather than an unsystematic and irrational set of rates based upon guess work and an estimate of what the consumers will pay, as has in the past been the more common plan. Similarly Messrs. Metcalf, Kuichling and Hawley have developed a method of fixing hydrant rentals which is based upon the cost to the water department or company of the fire protection furnished, rather than a comparison with rates in other cities or the plan of exchanging it for a franchise or other considerations offered by a municipality in which neither party has any idea as to which is more favored by the exchange.

Several members of the Association took exception to Mr.

Earl's idea of charging a uniform rate for water consumed, regardless of the amount taken by the consumer; maintaining that large consumers should receive special rates or discounts, as is common in the mercantile world. In this we believe that the objectors were influenced by their familiarity with previous methods rather than by reason. Large purchasers of merchandise of any kind are usually favored because the cost of securing the order, of entering the item upon the books, of collection, etc., is little greater for a large order than for a small one, and in general because the fixed charges are nearly the same for each order regardless of its size; with the additional reason that in many cases the cost of carrying and delivery are less per unit for large quantities than for small. There is in addition the idea in many cases that the amount of profit involved is so large that rather than lose it all the seller would reduce the unit profit. In the case of water supply, once having placed the connection and meter, the unit cost is no less for furnishing large quantities of water than for furnishing small, aside from the cost of maintaining the meter and connection in order, keeping the books and collecting the bills. Mr. Earl's method provides that these items of variable cost just referred to should be charged to the consumer at their actual cost plus a reasonable percentage of profit; and in these variables we find the parallel to the additional discount offered to large purchasers of other classes of merchandise.

There remains the argument in favor of sliding rates for the water consumed item that, if large consumers are not favored they may construct a water system of their own, or locate in some other city; and there is perhaps some reason for this in certain cases. If, however, the rates are established according to Mr. Earl's method, the rebate or discount to large consumers could not be very considerable unless the water were furnished at an actual loss. There is the counter-argument, which is especially applicable to municipal supplies, that the smallest consumers are generally the least wealthy ones and that consequently they should have the advantage of as low rates as any.

There is an additional reason frequently urged for municipal supplies, that low water rates will invite manufacturing plants to the city, or that high rates will drive out those already there; and that the presence of these establishments is of considerable value to the city. This is perfectly true, but a reduction in rates made for this reason becomes in effect a bonus offered to the company, just as some cities offer free land or no taxes. To conceal this bonus under the guise of low rates is to retain the unscientific and indefinite methods which it is the very purpose of the new methods of rate making to eliminate. If it is desired to offer such bonus, let it be done openly, the water department being credited with the regular rate and the difference being made up by a credit from the public treasury or payment by the local Board of Trade or whatever organization stands sponsor for the bonuses of other kinds offered.

The authors of the papers on fire hydrant rates state near the beginning of their paper that rates should lie somewhere between the cost of supplying the service and the value of such service to those who benefit by it. They outline a method for determining with more or less accuracy, the cost of the service and give some figures indicating the value of such service. However, in the rates suggested by them they do not appear to have taken any account of the latter. It is possible that we have not fully apprehended their idea, and that what they had in mind was that the charge should be based upon the cost, but that it should not be greater than the service rendered; and if it is greater than the value of such service, then either the cost of rendering the service should be reduced, the value of the service should be increased, or there should be no effort to render the service at all. This appears to us to be the proper basis; and the authors have apparently shown that the service rendered by fire protection is considerably greater than the cost, and have therefore justified the continuation of such service.

The authors of both papers have called attention to one important matter—the necessity for keeping such cost records by water departments and companies that it will be possible

to determine the itemized cost of each service, and pro-rate all expenses to the proper items of service rendered. Without such systematic book-keeping, combined with an accurate knowledge and careful interpretation of the various elements of cost, it will not be possible to establish rational rates for either water consumption or fire protection. Such systems of book-keeping have been urged by us for some time past, as have also the general methods of rate making so excellently developed by the authors of these papers; and we are glad to see evidences of a more general acceptance of these ideas.

Esthetic and Commercial Characteristics

The abstract of Mr. Whipple's paper in this issue calls attention to one of the characteristics of a water supply which is not directly connected with its effect upon the health of consumers, and incidentally illustrates the proposition that water works superintendents and engineers are expected by the consumers to consider what are sometimes called the esthetic features of the supply and those which affect its usefulness for commercial purposes. During the past few years so much attention has been paid to the treatment of water with the sole or chief purpose of rendering it safe, that many appear to have lost sight of the fact that consumers are entitled to have due consideration paid to their natural desires for a clear and colorless water, one which is not so hard as to require an extravagant use of soap or cause incrustations in boilers and cooking utensils, and for absence of other mineral substances, acids or alkalis which would cause a destruction of pipes and plumbing, the "red water evil," or affect the taste or odor to a perceptible degree. If one or more of these objectionable features are found to be introduced by the use of alum hypochlorite, or other agents used in water purification, then some remedy for this should be found or substitutes for these processes adopted. A great argument in favor of slow sand filtration is that there appear to be few, if any, offsetting objections to its use; and for the same reason it would appear that ozone would be a most desirable sterilizing agent if some method for utilizing it could be discovered which is physically and commercially practical.

STERILIZING BY ULTRA-VIOLET RAYS

CONSIDERABLE has appeared in the European and English papers during the past year concerning a new method of sterilizing water by the use of ultra-violet rays; but the practicability, both physical and financial, of the method seems as yet to be so far from commending it for use in actual service that little has been said about it in this country except as a matter of scientific interest rather than of engineering. In a paper before the Association of Water Engineers of England Max de Recklinghausen described experiments conducted by him at Sorbonne University, in which water containing *B. coli* was sterilized by a 220-volt, three-ampere silica lamp, sterilization being obtained within one second at a distance of 10 centimeters, within 4 seconds at 20 centimeters, within 15 seconds at 40 centimeters and within 30 seconds at 60 centimeters. Temperature was found to have little effect upon the speed of sterilization, even including the freezing point.

Experiments with various classes of micro-organisms showed that they varied in their sensitiveness to the action of the rays. Destruction was found to take place in the following times at a uniform distance. *Staphylococcus*, 5 to 10 seconds; cholera, 10 to 15; *coli*, 15 to 20; typhoid, 10 to 20; dysentery, 10 to 20; pneumonia, 20 to 30; *subtilis*, 30 to 60; tetanus, 20 to 60. Glass was found to be practically an absorbent of the ultra-violet rays and therefore must not be interposed between the rays and water.

In the city of Marseilles water previously clarified by multiple filtration is said to have been treated with ultra-violet rays with some measure of success.

From the above it would appear that water which is to be sterilized must remain within 20 centimeters (about 8 inches) of the lamp for at least 4 seconds, or within 4 inches of the lamp for at least one second, and that glass must not be interposed between the lamp and the water. This would apparently

require either very low velocities or a great number of sources of ultra-violet rays placed within 2 or 3 inches of each other throughout the channel through which the water to be sterilized is to be passed.

Concerning the cost of this method it is stated by Dr. Rideal that slow sand filtration would cost about \$10.40 per 1,000,000 gallons, rapid sand filtration about \$11.60, ozone \$16.40, and ultra-violet rays \$125 to \$175.

STANDARDS OF PURITY

THE vice-president of the Society of Engineers of England, H. C. H. Shenton, in a paper read before that society last month concerning standards of purity for water supplies expressed ideas which would not be endorsed by most American engineers. One of these is an assumption that chemists and bacteriologists have attempted to fix, and are to be criticised if they do not fix, standards of purity to be adopted by Boards of Health and water works officials, and to which engineers must attain in their works and processes for the purification of water. Add to this assumption the additional one that it is the duty of the engineer to bring all potable water supplies to whatever theoretical standard may be set up, regardless of what the difficulties and expenses may be, and we find Mr. Shenton proposing a basis of conduct for the water works engineer which would not be subscribed to by many engineers or even experts in pure science in this country.

Mr. Shenton devotes a considerable part of his paper to references to conflicting views held by engineers and others concerning the reliability of the coli test as indicating the safety or the reverse of a water supply, with a side glance at the possibility of there being water-borne bacteria other than cholera and typhoid bacilli which are more or less inimical to the health of human beings. Dr. Thresh he refers to as being "evidently of the opinion that water may contain many harmful organisms besides the typhoid or cholera bacillus, and that it is quite probable that impure water is to blame for many minor illnesses, owing to the presence of organisms as yet undetected or undefined." Such a conclusion has already been reached in this country and has formed the subject of several articles and papers during the past year or two. This, of course, does not reflect in any way upon the coli test, but merely indicates that such test is not altogether sufficient and that in time there will probably be discovered other hostile bacteria or pathogenic matter in water than are yet recognized.

Concerning the coli test he quoted Dr. Dibdin as saying, "To condemn a water which shows no sign of contamination other than a few *B. coli communis* and gives negative results to all tests for other objectionable bacteria, and also fails to respond to the most delicate chemical and microscopical tests for those substances which are known to be present in sewage polluted waters; a water, in fact, which exhibits all the characteristics of an exceedingly pure water, except for the presence of the aforesaid few *B. coli*—to condemn such a water is rash in the extreme."

As an illustration of the minimizing of the importance of coli, reference is made to John R. Downs, physiologist to the United States government, who found the water supply from certain water sheds to contain coli although these water sheds had been completely depopulated, the roads diverted from them and pollution prevented by police inspection. In this case Mr. Downs had attributed the presence of coli to birds and small animals on the water shed and concluded that their presence was not necessarily an indication of dangerous conditions; although in some samples coli were found present in one-half c.c. Mr. Shenton also quotes a number of authorities who have expressed their belief in the value of the coli test, and seems to consider the two classes of statements and opinions contradictory, expressing himself as follows:

In the face of the evidence given above as to the danger indicated by the presence of coli, it is begging the question to assume that any water is safe when coli are found in it in such large numbers (as found by Mr. Downs). In one case we have Professor Starkey demonstrating that water which

could not be found to contain coli in a sample of less than 100 c.c. actually produced disease, and in the other we have Mr. Downs ready to ignore their presence in one-half a c.c., merely because he has no reason to believe that the water is polluted. Surely, if such views are to be accepted as correct, not only does the coli standard become absolutely useless, but the work of the chemist and of the bacteriologist becomes useless also; all that is required is a person possessing common sense to look around and see that the water is not grossly polluted. . . . Until some standard for all cases is fixed the position of the scientist at the present time practically amounts to this: Tell me the source from which the water comes and show me whether it is polluted or not and whether it has produced diseases or not, and I will then adapt my standard to suit the requirements of the sample in question. If I do not see any obvious causes for pollution I will allow you to have coli in one-half a c.c.; but if I think that there is any risk of pollution I will demand the absolute absence of coli from 100 c.c., or from 1000 c.c., for that matter.

Mr. Shenton states that his object in writing this paper was to "attempt to bring home to the chemist and bacteriologist the impossibility under present conditions of agreeing upon any standard, conformation with which should prove that water is incapable of producing diseases in a greater or less degree. What they can do, and what they ought to do, is to fix a standard which should prove that the water is free from given definite organisms believed to be harmful. Thus, if absence of coli were insisted upon, one might be reasonably sure that typhoid germs were absent; but according to the statements of the scientists quoted above, absence of coli does not necessarily prove the absence of certain other organisms, more or less indefinite at present, which they believe to be harmful in a minor degree. With regard to coli, typhoid, and other well defined water-borne disease germs, there is no such difficulty. If the scientist believes that they should be excluded, he should say so in no uncertain manner. If the scientist will fix his standard we, as engineers, are prepared to make any water conform to that standard."

Concerning the pollution of streams he states:

Although it is possible to purify water to any required degree, this does not afford the slightest excuse for acquiescing in the pollution of water supplies. Here, again, it rests with the medical authorities and with the chemist and bacteriologist to insist strictly and uniformly upon the prevention of pollution. If they will do so we, as engineers, are quite prepared to make all sewers, house connections and house drains as water tight as we make our water mains. We are prepared to do away with every soakage pit or cess pit in the country; we are prepared to purify all sewage discharged at outfall sewers up to any degree of chemical or bacterial purity required.

We cannot agree in any way with the attitude assumed by Mr. Shenton nor with most of the hypotheses upon which he has evidently based his discussion. By stating that the scientist should adopt a standard of purity which the engineer must live up to, he seems to assume that the engineer is not a scientist, and that he should himself have nothing to say about the adoption of the standard. This is by no means the conception of the duties and responsibilities of an engineer which are held in this country. On the other hand he seems to assume that it is possible for the engineer to reach perfection in both the construction of sewers and sewage works and in the purification of water. Theoretically this may be possible, but the engineering profession in this country certainly does not consider itself "quite prepared" to bring about such ideal conditions; and it is absolutely certain that it would not receive from municipal and other authorities the enormous financial backing requisite.

More important than this, however, are his remarks concerning the coli test, since they seem calculated to belittle the importance of this, and in fact, to assert that because an absolute and incontrovertible standard has not been fixed it seems useless to live up to such lights as we have. There would probably be no question by either Mr. Shenton, his "scientists" or engineers that the best test to make of water supplies would be one for the typhoid bacillus, the cholera bacillus, and the several other pathogenic bacteria, and other harmful matters, if there be any, and judge the water accordingly. Unfor-

tunately it has been found impossible to test for typhoid bacteria, both because of the limitations of our knowledge and because of the comparative infrequency of these even in sewage polluted waters. As to the other harmful organisms which may exist in the water, we have not even learned to identify these or to be positive that they exist at all. It therefore appears that such direct test as seems desirable is, in the present stage of our knowledge of bacteriology, impossible of attainment. It has, however, been found that all sewage teems with B. coli, and the detection of these has of recent years been made comparatively easy and certain. Unfortunately B. coli are voided from the intestines of many other animals besides human beings, and consequently the presence of them is not a sure indication of sewage pollution. Consequently, although the presence of quantities of B. coli should cast grave suspicions on the water, if, as in the case reported by Mr. Downs, investigation of the water shed shows that it is impossible that any such quantities of B. coli, if indeed any at all, could have been contributed by human beings, this evidence may be taken as even more positive and determining than the presence of the B. coli.

Even were the test for typhoid bacilli possible and certain, it would still be extremely undesirable to rely upon them, but something similar to the coli test would still be necessary. The reason for this is that it would be quite possible that the sewage of a certain town would not, for months at a time, contain a single typhoid bacillus, owing to the absence of cases of that disease in the city. And yet, with the occurring of a case of this disease such bacteria would probably be present in considerable quantities. Even daily tests of the water receiving this sewage, however, might not reveal this danger until there had possibly been several hours' flow of the typhoid-contaminated sewage. Therefore the standard test should be one which indicates the presence of sewage rather than merely the presence of typhoid bacteria.

The apparent effort of Mr. Shenton to belittle the coli test or else to reflect upon the sincerity or courage of their convictions of the engineers who believe in it, seems to us to be very unfortunate and one whose cause we cannot understand. The coli test has been and is of great value in determining whether there is ground for suspecting sewage pollution in a water supply; and it serves to give warning of any considerable change in conditions as to such pollution. It is not absolute nor infallible in its determinations; but neither are the judgments of any of the experts in engineering, medicine or other applied sciences in which we are compelled to place dependence. Neither engineers nor bacteriologists believe or claim that this test is all which is desired, but it is the best which science has yet to offer. To refuse to use it because it is not perfect would be childish; but to adopt it implicitly and close one's eyes to other tests and indications which may either confirm or refute this is to be criminally blind to the known facts of the case.

As to the readiness of engineers to live rigidly up to standards of theoretical perfection or even the desirability that they should do so, we believe there is little question among practical men. When mankind eats only sterilized food, breathes only air from which has been removed all dangerous dust, with its possible burden of tuberculosis germs and others, when every case of communicable disease is immediately isolated, when all flies and mosquitoes have been exterminated and many other more important sanitary reforms have been effected, then there will undoubtedly be included with these the removal of all danger due to the pollution of streams with sewage or to the existence in water supplies of the last faint trace of such pollution. But the preservation of life is not more important than living; and if all man's energies, resources and expenditures are to be devoted to the preservation of life he will, we fear, feel by that time that the life has ceased to be worth preserving. There is a reasonable limit to all things, even to the measures which should be taken for the preservation of life and health.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Test Will Be Made of Paving Demand

Milwaukee, Wis.—A test suit to determine whether the city can force the Milwaukee Electric Railway & Light Company to lay new pavements between rails and one foot on each side, when a different pavement than that in use is desired, may be the result of action which will be recommended to the Council as an outcome of a meeting of the Committee on Streets and Alleys. On recommendation of Assistant City Attorney Williams, the committee decided to report for adoption a resolution compelling the street car company to pave its right of way on Twenty-seventh street, from Vliet street to North avenue, with bituminous material. According to J. G. Simmons, of the railway company, the action will be tested. Mr. Williams informed the committee that in his opinion the city had the right to compel the company to use any kind of pavement desired on this street under the 1900 franchise. Superintendent Simmons said that if the object was to have the company replace its cedar blocks there would be no dispute, as the company was willing to comply with such a request, for the reason that the street was now paved with this material. He further stated that the requirement to have traction companies pay for pavements was a legacy of the "horse and mule car" days, when the pavements were damaged considerably, but that now, as far as the companies were concerned, no pavement was necessary. He cited the practice in many cities, where the streets are sufficiently wide, of having grass between rails.

Cart System Will Be Used on County Pikes

Knoxville, Tenn.—The cart system of taking care of the roads in Knox county will first be tried upon the Tazewell and Jacksboro pikes, according to the action of the Knox County Road Commission at a recent meeting. If it works successfully, it will be placed on other pikes.

Delegation Views Atlantic City Paving

Long Branch, N. J.—A delegation of City Councilmen and other city officials and a committee of the Board of Trade visited Atlantic City recently for the purpose of inspecting streets and street paving. The visiting delegation was entertained by Atlantic City officials, particularly those identified with the engineering and street department. The visitors were conducted over a number of streets of bitulithic construction. One street in particular, now in course of construction, appealed most favorably to the visitors, as it could be seen in its various forms of completion. After ascertaining how the bitulithic pavement is laid, the committee was taken in automobiles to the paving company's plant, where the preparation and mixing of the material were fully explained. Streets that had been laid for several years were gone over. They were found to be even and unbroken, and appeared in the best of condition. The streets of Atlantic City have brick gutters, and this adds to the appearance as well as the durability of the construction.

Meet to Discuss Grade Crossings.

Dayton, Ohio.—A meeting of the special committee on grade crossings of the Chamber of Commerce with the representatives of the several railroads entering Dayton was held recently. City Engineer Cellarius told the body that the proposed improvement would cost about \$6,000,000, and would take about six years to complete. He also stated that should the improvement cause any change in the alignment of the different roads that it could not be forced. He said that according to statutes 63 per cent of the cost was to be borne by the railroads and the remainder by the city. Engineer Cellarius also said that a river having a rise and fall of from 15 to 20 feet would have to be considered in the proposal. According to those who attended the meeting the matter will be pushed from now on.

An Improvised Pressure Oil Sprinkler

Waterbury, Conn.—Superintendent of Streets Benjamin Chatfield and his assistants have converted an ordinary sprinkling wagon into a pressure distributor. An air pump is located at the back of the wagon, the power to operate it being taken from one of the rear wheels and transmitted to the pump by a series of chains and sprockets. There is a safety valve set to blow at 40 pounds and the pump may be thrown out of gear by a clutch. A hand pump at the top

Courtesy Waterbury Republican

PRESSURE OIL SPRINKLER USED IN WATERBURY

of the cart is used to transfer the oil from the supply wagon into the sprinkler. A strip of road either six or three feet wide may be oiled at one time. It is roughly estimated that two miles of road may be oiled in a day. A trough is let down below the sprinklers when crossing walks. A measuring device shows the amount of oil in the wagon, so that the proper amounts may be charged to each job. Three horses are used to draw the wagon.

Oiling Streets on Huge Scale

Yonkers, N. Y.—In the last two weeks three giant tanks of oil, each with a capacity of 6,000 gallons, have been received here, to spread on the macadam roads and all has been used up. Never in the history of Yonkers has oil been used for this purpose to such an extent, and the cost of flushing the streets will, therefore, be an item, in the expense of running the Department of Public Works, of unprecedented proportions. The reason for this situation is the abandonment of using water for sprinkling, in accordance with the recommendation of the Joint Water Committee, who considered that move would greatly conserve the city water supply. All the macadamized streets in the city are being oiled under the direction of Mr. William A. Coyle, who has looked after this branch of the work of the Department of Public Works since its inception, four years ago.

Property Owners Must Pay for Pavements

Spokane, Wash.—The proposition that the general fund of the city assist abutting property owners in paving streets to the city limits to connect up with county roads is frowned on by Commissioner of Finance Robert Fairley. Strong opposition by other city officials is advanced against the plan, which was a suggestion of City Engineer Morton McCarty recently at the chamber of commerce. It is practically certain, from indications at the city hall, that no such plan will be adopted by the City Commissioners, owing to the state of the general fund and the dangerous precedent which would be set.

SEWERAGE AND SANITATION

Plans Sewer Conference

Montclair, N. J.—Mayor Hinck, who is the leader in the movement to establish an independent sewage disposal system for the municipalities of Montclair, Orange, East Orange, Glen Ridge and Bloomfield, which have demurred at signing the agreement for the \$12,000,000 trunk sewer planned by the Passaic Valley Sewerage Commission, has announced his intention of calling a conference of the mayors, councils and boards of health of all the municipalities of this section of New Jersey, at which the project which he has in mind will be thoroughly discussed. Mayor Hinck believes that when the independent sewage disposal system is explained the opposition which has developed against the scheme in Bloomfield and Belleville will be removed. The authorities of Bloomfield and Belleville each have taken official action protesting against the proposed disposal plant being in either of those municipalities. The town of Montclair has acquired about sixty acres of land in Bloomfield and Belleville, on which it is proposed to establish a disposal plant, which, according to Mayor Hinck, may be operated without causing a nuisance to the communities in which it is situated. It is declared Mr. Hinck has opposed the participation of Montclair in the joint trunk sewer project because he says the method of assessment of cost, which is by ratables, is inequitable and unfair to this municipality.

Health Officer Orders Clean-up

Bay City, Mich.—Unscreened doors admitting swarms of germ-carrying flies and other evidences of absolute disregard of ordinary sanitary precautions which he promptly branded a menace to the public health were found by Dr. Edwin Goodwin, health officer, in an inspection last week of several business places. He had called at the places only a few days before with sweeping orders to improve conditions at once. Evidently, they did not anticipate such an early return, for little had been done toward carrying out his instructions. The health officer has declared war on unsanitary ice-cream makers, dairymen and butchers, and will make a rigid inspection as often as possible. Some places he already has visited several times because the proprietors are slow to remedy unsanitary conditions. All, however, have indicated a willingness to clean up and stay clean.

Open Sewers Menace Health

Racine, Wis.—Action is to be taken immediately by the local Board of Health to remedy unsanitary conditions existing in Root River, where the current at the present time is not sufficient to carry off the sewerage, thus menacing the health of people living in the vicinity. It is possible that the State Board of Health will also take action in the matter. The river is exceedingly low at the present time, bounding not over 14 inches near Sixth street bridge. The reason for the decreased depth is not known, but is thought to be the lowering of Lake Michigan and the consequent training of the rivers by the Illinois Drainage Canal. It has been suggested as a remedy that a flushing sewer be built, similar to the one which the City of Milwaukee now operates, in order to keep the channel free from contamination. Action will also most likely be taken by the Health Board in regard to other sewers which are not built properly.

Sewage Disposal Plant Inspected

Washington, Pa.—Twenty-two members of the city councils of McKeesport, headed by Mayor H. L. Arthur, recently visited Washington for the purpose of inspecting Washington's up-to-date \$100,000 sewage disposal plant at Arden. The party of McKeesporters were taken in charge by some of the Washington officials and conveyed to the disposal plant. They put in a greater part of the afternoon there, and then after seeing as much of Washington as possible returned to the Tube City. McKeesport is confronted with a somewhat serious problem in the disposal of its sewage. At present the sewage is dumped into the Monongahela River, but this practice must be stopped, according to an edict of the State Health Department.

WATER SUPPLY

Artesian Wells Are Proposed for Washington, D. C.

Washington, D. C.—If a movement just inaugurated by the Federation of Citizens' Associations materializes the District Commissioners may ask Congress for an appropriation with which to dig a number of artesian wells in the District. President William McK. Clayton, of the Federation, says that the matter has been put up to the Commissioners and that the Engineering Department of the District government is now preparing a report on it. "The Federation believes," said President Clayton, "that artesian wells, located at certain points in the city, would accomplish a great deal of good, not only in providing cool water for poor families who cannot afford to buy ice, but in keeping many persons out of saloons." President Clayton said that a number of citizens and representatives of the clergy had assured the federation of their interest in the plan, and that as soon as a definite reply has been received from the Commissioners an effort will be made to bring strong pressure to bear to have the matter favorably acted upon.

Water Company Earns \$40,651.75

Louisville, Ky.—The condensed statement of the operation of the Louisville Water Company during the month of April, signed by Auditor John S. Morris and General Bookkeeper R. H. Gardner, shows an expense of \$4,730.16 for cleaning the basin and repairing the division wall, making the total expense during the month about \$4,000 more than the expense during April, 1910. During April the total income was over \$66,000 and the net earnings \$40,651.75, or \$1,216.33 less than in April, 1910. But for the extraordinary expense due to repairing the basin the net earnings in April, 1911, would have showed a large increase over the earnings of a year before. The statement shows that 263 employees were paid \$14,569.32 during the month and that the list of permanent employees numbers 133. Two private line connections were made, two gates put in old lines and 10,468 feet of pipe laid.

Underground Lake Found in Huntsville

Huntsville, Ala.—A large underground lake from which the Huntsville spring derives its water has been discovered under the public square and extending back an unknown distance, according to Engineer Nathan Buchanan, who has been making excavations for the city. It is the intention of the city to have the lake explored, if possible, with a view of ascertaining from which direction the water comes. The water is still and deep and is seen as far back under a ledge of rock as light can penetrate. Operations are being carried on under the city with the purpose of locating the main stream that supplies the spring and tracing it out beyond the city limits. This is believed to be entirely feasible.

Double Main Water System for Fire Safety Proposed

Dayton, O.—To use the old canal basin, with the hydraulic and its various other tributaries as the basis of a double main water system for fire service, is part of a novel and interesting plan for the city's fire safety which Councilman Charles Roehm, of the Ninth ward, is working out. The Councilman's suggestions, very timely in the light of the present water predicament in Dayton, are being discussed with considerable interest about the municipal offices. Councilman Roehm's scheme was designed when the N. C. R. Company recently published an illustrated pamphlet in the interest of abandoning the canal. Councilman Roehm's plan, in brief, is to use the canal as a main conduit with tributaries and branches connecting reservoirs at various parts of the city for water with which to fight fires. The Councilman's plans would not prohibit the parking of the property throughout the city as the conduits would need but a small portion of the park space. The fact that the canal winds through the very most congested portion of the city adds much to the feasibility of Councilman Roehm's plan. Fire experts and fire insurance companies have repeatedly pointed out the necessity of double mains in Dayton and the fool-hardiness of using drinking water mains for fire fighting.

Plenty of Water for Ogden People.

Ogden, Utah.—Work on the Cold Water canyon conduit has progressed so far as to permit the final closing of the pipe line, the last juncture being made at a point on the Farr property, near the lime kiln. None of the pipe joints have been covered as yet, the excavation between lengths having been left open until each length and joint can be thoroughly tested for leaks. These tests will be made at once, after which the water will be turned in from both the old line up Ogden canyon above the confluence of Cold Water creek, and the new line up Cold Water canyon, in order that that portion of the old line between the last point mentioned and the reservoir may be thoroughly overhauled and repaired. When this has been completed the city will be provided with two separate systems, each of which may be used individually and the water from either turned into one or both. At the top of the hill near the sanitarium, both lines converge into a three-foot line, which continues to the reservoir. The old reservoir No. 1 has been re-excavated and its banks remodelled and the work of concreting it throughout will commence soon. About 2,000 barrels of cement will be used and it will require about four weeks to place it in first-class condition. The capacity will be 7,000,000 gallons, which, with 13,000,000 gallons in the new reservoir No. 2 will furnish the city with a storage of 20,000,000 gallons of water. Both reservoirs will be kept practically full for protection against fire, yet with the new system of valves and connections either may be used while the other is being cleaned or repaired. An automatic overflow has been installed which will convey the surplus water back into Ogden river.

Water Works to Charge Less

Toledo, Ohio.—Property owners will save \$7000 per year as a result of a reduction for improvements in the Water Works Department announced by Service Director Cowell. In the past the department has been receiving \$12 for making a tap in a water main and in the future the price will be reduced to \$10. Director Cowell says that about 1500 taps were made in a year, which means \$3000 less to the property owners on this item alone. The city has been charging \$9 for water meters, which meant a profit, and this price will be reduced to \$7 per meter, which is the cost price to the city. Director Cowell says that no charge will be made for water connection improvements between the water main and the curb line, which the property owners have been forced to pay for in the past.

Water Company Cleans Dry Wells With Steam Pressure

Hutchinson, Kan.—Artificial geysers are made daily in Hutchinson now. The demonstrations are the result of the work of the water company to clean out some of the dry wells just west of their plant on West Sherman street. The wells are seventy feet deep and the clay had caked and refused to let the water through. It was decided to blow the wells with steam. The wells are six inches in diameter and the steam is put down in a two-inch pipe under a 200-pound pressure. Being so far down it is able to form a strong head under the water and when the power overcomes the pressure it shoots water, mud and rocks into the air to the height of seventy feet or more, while the explosion sounds like a dynamite blast. The water company is having good success with the system and will soon have the wells in running order.

Filtration Plant Is Praised by Russian Mayor

Philadelphia, Pa.—Asserting that the fame of the Torresdale filtration plant had spread throughout Europe and that he came here to inspect it to gain ideas for a similar plant to be built in Russia, at a cost of a million dollars, Ivan Begerow, Mayor of St. Petersburg, spent more than half a day in this city, afterward leaving for Pittsburgh. Traveling incognito, the Mayor, regarded as one of the most progressive Russians in the Czar's lands, was enthusiastic over the vast equipment at Torresdale and the facilities for purifying water in such quantities. "I have visited all the larger cities of Europe," he said, through an interpreter, Frederick H. Florinsky, a secretary, "and none of their filtration plants can compare with that of Philadelphia.

United States Government Experts Will Test Water Pipes

Erie, Pa.—Experts of the United States Government Bureau of Standards are coming to this city to make tests of the local water mains to determine the extent of the action of electrolysis in the pipes. Burton McCollum of Washington has arrived in the city to take up his work, and he will soon have a force of men with him. It is expected that the active work will commence about July 1, when a survey of all water pipes will be made. The experts come to Erie at the expense of the government and they will be given all possible assistance by the local Water Board.

Plan to Instal Meters to Prevent Waste

Muskogee, Okla.—The question of placing water meters on every house receiving the service has become a live issue in city hall quarters and Commissioner Fleming has issued orders that all new taps placed must be ordered. The action of the council in deciding to comply with the recommendation of Mr. Fleming in this respect and the action of the Commercial Club in endorsing it were more or less discussed and many business men called at the water department and talked the matter over with the commissioner. In cold figures it appears that the waste of water each year runs to about a hundred thousand dollars. In his statistics, Mr. Fleming points out that 3,500,000 gallons per day for four thousand services is a heavy toll for the money paid.

City Seeks Water Supply

Talladega, Ala.—The city is quietly looking around for a source of additional water supply. The water at present piped to consumers is from a bold limestone spring in the center of the city. But limestone water is objectionable to many and it is liable to cake in boilers and machinery. Besides this the continued growth of the city will eventually demand more water than the present source can supply. Several tentative propositions are pending. One of them is to dig an immense well or reservoir north of the city where freestone water abounds and pipe freestone water from this source. Another proposition is to run the water from Talladega creek at or near Cragdale.

STREET LIGHTING AND POWER

Town in Darkness

New Castle, Del.—New Castle owes the Delaware Water Improvement Company about \$10,000 for light and water. Some days ago a conference was held and City Treasurer Manlove was instructed to pay the company \$1,500 on account. The company refused to accept the cash and ordered the electric lights to be cut out. As a consequence the streets were in darkness.

Mayor Will Push Cheaper Gas Rates

Baltimore, Md.—Declaring his intention of proceeding as rapidly as possible with the city's attempt to get cheaper gas rates, Mayor Preston states that he would consider a compromise offer from the Consolidated Gas, Electric Light & Power Company only with the advice and counsel of his proposed advisory board of citizens and the Board of Estimates. For the present it is the intention of the Mayor to proceed with such investigations incident and preparatory to a regular hearing on the question before the Public Service Commission, and any proposition which the company might find agreeable as a compromise would have to originate with the Company.

Give Prize for City Light Design

Columbus, O.—J. William Thomas, a member of the firm of Howell & Thomas, architects, was awarded the \$50 prize offered by the retail merchants for the most appropriate design for a cluster light standard for the new system of lighting that is to be installed throughout the business section of the city, and for which the City Council has already made an appropriation. Mr. Thomas' design is built on the lines of a Greek cross. Four stems, starting from the base, gradually decrease in size, until the brackets which bear the lights are reached. Honorable mention was given to four others.

FIRE AND POLICE

New Fire Net Gives Satisfaction

Schenectady, N. Y.—The new fire life net, constructed by Captain Alberts, of the Hose Depot on North College street, has been given its first practical test in the rear of the Central Fire Station in the presence of Mayor Durlea, Commissioner McDonald, and Chief Yates. Bags of sand, weighing 130 pounds, were thrown from various heights and caught with ease in the new net. A feature of the net is that it can be built for about \$17, whereas the ordinary net costs from \$75 upwards. All who witnessed the demonstration were well pleased.

Birmingham to Have Twenty-four Motor Fire Engines

Birmingham, Ala.—With the placing of an order for nine Seagrave combination hose and chemical wagons, and the making of arrangements for nine more to be ordered a few months later, Birmingham promises to take the lead among American cities in the adoption of motor fire apparatus. The city already has in commission three Sea-

Courtesy Birmingham Age-Herald.

TYPE OF COMBINATION WAGON ADOPTED FOR BIRMINGHAM

grave wagons similar to those ordered, two Webb machines and one auto fire engine. President Culpepper Exum, of the Board of Commissioners, figures that the efficiency of the Fire Department will be increased 40 per cent. and its running expenses reduced \$30,000 a year. The illustration shows one of the combination wagons in front of the old City Hall at Woodlawn, a suburb recently annexed to Birmingham.

Chief's \$3 Investment Brings Home \$5,000 Prize

Dallastown, Pa.—An investment of \$3 in a book of chances on an up-to-date hook and ladder truck taken by Leo Hollinger, chief engineer of the Rescue Fire Company, of Dallastown, at the Altoona Firemen's Convention, has won the \$5,000 prize.

Visit Neighboring City to See Test of Auto Truck

Paterson, N. J.—Commissioner Milson, of the Board of Public Works, and Fire Chief John Stagg, both of this city, were among the guests at the trial of the new auto truck in Passaic, and they were as pleased as the Passaic people with the manner in which the machine worked, inasmuch as a truck of the Paterson Department is to be converted in a similar manner. The machine was given the hardest kind of a test, in that it was driven over a 14 per cent. grade which was muddy after the rain of the preceding day.

Auto Engine Tested

Wilmington, Del.—For two and three-quarter hours the Red Streak of the Water Witch Fire Company was put through a test which caused the firemen present to wonder how the engine stood it, and at the finish, they almost shouted as W. M. Johnson, representing the National Board of Fire Underwriters, of No. 135 William street, New York, announced that it was the finest test of a like sized apparatus he ever held.

GOVERNMENT AND FINANCE

Reform Councils for Two Cities

Harrisburg, Pa.—The bill to provide small councils for the second-class cities of Pittsburg and Scranton was approved by Governor Tener. Under the terms of the bill, which was agreed to in the form of a conference committee report on the last day of the Legislature, the Councils of the two cities are ripped out of office and for Pittsburg there is provided a Council of nine, to be paid \$6,500 a year each, and for Scranton five, to be paid \$2,500 a year each. Governor Tener has appointed nine anti-Magee residents of Pittsburg to serve as members of the single Council of that city, as provided by the second-class city act. The Councilmen will serve until the first Monday of next January, their successors to be chosen at the November election. It is said that some members of the old Council in the city of Scranton will protest against the enactment on the ground that it is unconstitutional, and the matter may go to the Supreme Court.

Could Protect Funds of City by Publicity

Baltimore, Md.—It is advocated that a system of periodical financial statements by the city would protect its funds. Recently an employee of the city was charged with embezzling \$67,000. If the City Register, like the State Treasurer, was required to publish monthly statements of the amount of city cash on hand in each of the depository banks this could not have been possible. Monthly statements by the city as to the amount it claimed to have in each bank would naturally have been watched closely by the banks. If at any time in the period of two or three years during which the defalcations had occurred the city had claimed more cash in one bank than was actually on deposit, the bank would naturally have raised an objection. An objection would have started an investigation, and the thieving would have been stopped long before it was.

Commission Government Elections

Norwich, Conn.—By a majority of 387 the electorate turned down the commission form of government. Norwich is the first city in the State where the proposition has been put to a vote.

Mobile, Ala.—By a majority of 829 out of a total vote of 3,612 the city of Mobile adopted the commission form of government.

Kingsville, Tex.—In the election on the proposition of incorporating the city under a commission form of government, with Charles H. Flato for Mayor and Ben T. Laws and E. F. Wier for Commissioners, the proposition was defeated by two votes, the vote standing 125 for and 127 against.

Missoula, Mont.—By a majority of 279 votes the Des Moines commission form of government was adopted.

Ordinance Provides for Equitable Basis in Assessments

Spokane, Wash.—A new basis for the assessment of the cost of public improvements against the property benefited is provided for in a proposed ordinance drawn by the city legal department. The measure is based on the new State law which went into effect June 8. Instead of dividing the property 150 feet back from the street into three zones 50 feet each wide, as at present, for assessment purposes, the new law divides it into five zones or 30 feet each. At present the three 50-foot zones pay, respectively, 50, 30 and 20 per cent of the cost of the improvement. Under the new law the five zones will pay, respectively, 45, 25, 20, 10 and 5 per cent of the cost. This arrangement of assessment makes the strip of property fronting on the street to be improved and the property farthest away from the street pay less, while the property in between pays more than at present. The proposed ordinance provides, also, for the day labor system of doing improvement work, although bids by contractors on all jobs are required, whether the improvement is to be by day labor or not, to be decided after the bids are in. An important provision is the one requiring that the City Engineer's estimate shall be the basis for making up the assessment roll in cases where day labor is employed, thus allowing the assessment roll to be made up and passed before the work is completed.

STREET CLEANING AND REFUSE DISPOSAL

Would Clean City at Less Expense

Butte, Mont.—In the programme of economy in the Health and Street Departments that the present administration will attempt to inaugurate, municipal ownership of the city teams is to be a feature. A statement has recently been prepared by the City Clerk and submitted to the Mayor, showing that the cost of a team to the city is \$3.50 per day. Under the proposition of municipal ownership it is said the teams can be maintained for \$1 a day or less. The initial cost, that is, the cost of purchasing the teams and providing a stable for them, also is estimated. It is planned to purchase something like 25 teams. A more progressive and advanced plan now under advisement is that of furnishing the Fire Department with auto propelled equipment and using the fire horses in connection with the work on the streets and alleys. The assistance of the street car company has been asked. The more progressive plan contemplates a central point in the city to which all garbage and refuse gathered in the streets and alleys may be hauled and the hauling of this refuse to the city dumping grounds or crematory in ore cars, operated in the early hours of morning over the street railroad. The plan is not only feasible but will effect a saving of one-half over the plan in vogue.

Will Try New Idea in Street Cleaning.

Altoona, Pa.—Determined to make the forces and means at his command as effective as possible in keeping the streets of the city clean during summer Superintendent of Highways W. H. Fields has put in service half a dozen service patrol carts with cans, which will be used in the hand sweeping about the city. Accompanying each cart will be three cans, making 18 in all. One of the sources of complaint heretofore in connection with the street cleaning operations has arisen from the fact that the dirt has been swept on piles against the curb, where it has afterward been gathered up by the wagons and hauled away. In the mean time several hours were likely to elapse during which the dirt was apt to be blown about by the wind, causing much annoyance. Under the new system the men operating the carts will sweep until the can is full, and then it will be set to one side and another can used, the wagon in the mean time making the rounds and gathering up the cans. The cans are 24 in. high and will hold about two bushels.

Garbage Dump Making Trouble.

Williamsport, Pa.—For the fourth time within two weeks No. 2 Engine Company has been called to the garbage dump west of the Citizens' Electric Company. The frequent calling out of the company will probably result in the matter being taken up by Councils at the next meeting. City Solicitor Cummings was summoned to the dump and looked the place over thoroughly. Every time that the dump has broken into flames Jonas M. Fisher of the Citizens' Electric Company has asked that the engine and men be sent down and they have always responded. When they were busy with other work he would threaten to sue the city if they did not come. Chief Stryker is incensed over the matter. He says that the engine uses thousands of gallons of water and that even this will do no good, as the fire will soon break out again. The only thing to do, according to the chief, is to let the fire burn until it burns itself out, setting a watchman to guard it day and night. The flames are smouldering many feet under ground and cannot be reached by the hose. The chief is of the opinion that should there be many more calls of a similar nature the reservoirs will undergo a serious drain, and if there should be a drought the city may suffer.

Refuse to Pay For Cleanup

Greenfield, Ind.—A few weeks ago during a cleanup day in this city the mayor and street commissioner employed several men and teams to dispose of the rubbish and the commissioner's orders amounting to about \$50 were cashed for different persons by local merchants, who later presented the bills to the council, which allowed them. The clerk and treasurer refuse to issue or pay the warrants, contending they are illegal, although the city attorney has given a different opinion. They were advised by the state board of accounts that there is no fund from which to draw these bills and that they would be personally liable.

RAPID TRANSIT

Plans to Tax Street Cars

Topeka, Kan.—The taxing of street cars and all pole lines in Topeka is embodied in an ordinance now being drawn up by the city commissioners. It is planned to tax every street car in the city at \$25 each. The poles owned by the telephone, telegraph and electric light companies will be taxed at about 50 cents each. These figures have not been settled, but they seem to be the figures now chosen by city officials. The revenue from the street railway is proposed in order that the city might receive some sort of a tax from this company. The original franchise gives the city of Topeka nothing from the Topeka Railway Company for the operation of their lines in this city. It is figured by some of the commissioners that a tax of \$25 a car will be a means of gaining a revenue. The law provides that the city shall receive a certain per cent of the gross earnings, but nothing has been turned over to the treasury since the franchise was accepted many years ago.

Will Electrify Line on Getting Franchise

Salt Lake, Utah.—Plans are on foot to electrify the Salt-air line as soon as the City Council grants a franchise to come down Main street. Under the new arrangement, instead of discharging 2,500 passengers all at once at the West Second South street depot, 200 can be brought back from the lake at a time on interurban cars, and there will be no congestion in transferring to the city cars at various points along South Main street.

City Ownership of Street Railway Will Be Submitted to Vote

Detroit, Mich.—Again Detroit is to wrestle with the municipal ownership of street railways question. Right in the midst of the hot summer Mayor Thompson has announced that he wants the question submitted to the people this fall. A majority of the aldermen are with him on the proposition, and the question of the city buying the D. U. R. would undoubtedly be placed on the ballots at a special election, if it were not for the fact that legal steps will be taken to prevent such action by the city officials. Under the original home rule act, passed by the Legislature of 1909, petitions were circulated for the submission of the questions and the required number of names secured. But a suit was started by property owners to prevent the question going to the people and it was successful, the Supreme Court holding that no charter could be amended piecemeal under the home rule act until after there had been a general revision by a charter convention. At least that seemed to be the opinion of the Court, although a dozen interpretations were read into the decision. Corporation Counsel Hally contended that the defect in the home rule act could be cured by amendment, and he succeeded in securing the amendment he wished at the last session of the Legislature. But while the Legislature was doing that it also fixed up the act so that it will be almost impossible for the people to secure the submission of amendments by initiatory petitions, the law now compelling the securing of 25 per cent of the registered vote signed at the polls. But Mr. Hally contends that the aldermen may submit any question to the people at any time. Therefore the steps for the submission are now being taken in the Council. But the gentlemen who successfully fought the submission of municipal ownership before insist that no amendment to the home rule bill was sufficient to enable piecemeal charter amending and they are prepared to go into court and fight the proposition over again.

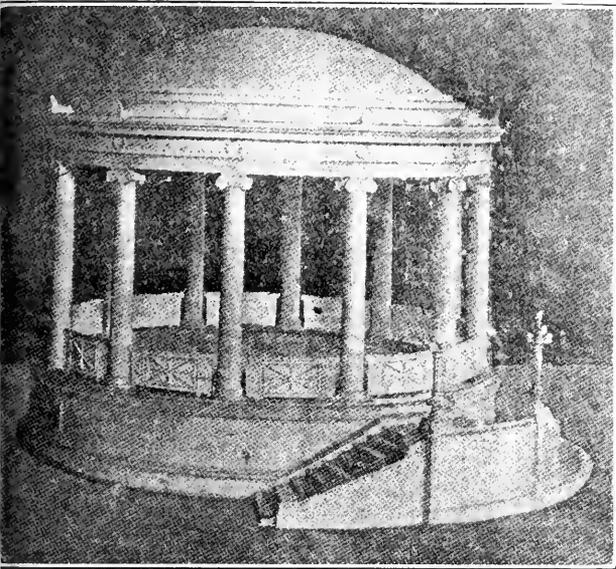

Electric Road to Accommodate Commuters

San Francisco, Cal.—It has been announced that preparations are being made for an electric road running between San Mateo and San Francisco, and that the plans would undoubtedly materialize, providing the proper sentiment was found to exist relative of a right-of-way through the cities of San Mateo and Hillsboro. The necessary capital has been secured for the undertaking, and it is proposed to establish express train service and grant commuters' rates. Those behind the project feel confident that there will be little difficulty in securing the desired right of way. This is a line that has been long desired by the residents of San Mateo.

MISCELLANEOUS

Band Stand for a Boston Park.

Boston, Mass.—A miniature model in plaster of the marble band stand that will be erected on Boston Common as a memorial to the city's benefactor, George F. Parkman, is on exhibition in Mayor Fitzgerald's office and has met with general approval. The stand will be built several hundred feet southwest of the existing structure, near Flagstaff hill, and the board of health has promised to take down the convenience station there and build another underground. The stand and pavement around it will cover about 3,000 square feet. The superstructure will be of pink marble and

MEMORIAL BAND STAND FOR BOSTON COMMON

the base of granite. The ceiling and floor will be inlaid with marble and there will be 12 perforated pillars of bronze. The architects, Derby, Robinson & Shepard, who won in the competition, have wrought in the spirit of the early Roman style, that of plain, chaste and delicate outlines, without a trace of modern ornamentation. The City Council appropriated \$50,000 from the Parkman fund several months ago for the band stand and other improvements for the Common. The stand will cost about \$25,000.

Playground Commission

Schenectady, N. Y.—Mayor Charles C. Duryee has decided to appoint a committee of five prominent citizens to investigate the subject of municipal playgrounds and report to him upon the advisability of working out a comprehensive plan for the establishment of such playgrounds and the enactment of the legislation necessary to establish them. The appointments will be made shortly.

Will Push Harbor Development of Chicago

Chicago, Ill.—Chicago harbor development has been stimulated following action by the Council when a resolution was adopted by unanimous vote directing the Harbor Committee to proceed without delay to draft an ordinance. Ald. Charles M. Foell, Republican, who has been pushing the harbor proposition for years, offered the resolution, which called attention to the enabling legislation obtained at Springfield for an absolute municipal ownership and controlled harbor. The tonnage of the port of Chicago proper has been declining annually for the last ten years or more, while that of all the other principal ports on the great lakes has been rapidly increasing. The Chicago Harbor Commission after a thorough and exhaustive study of the leading American and European ports, pointed out Chicago's inadequate and neglected harbor facilities as one of the principal causes of this decline, and recommended the immediate construction of piers extending into Lake Michigan as an indispensable means of rehabilitating the lake commerce.

Many Cities Plan Exhibits for Big Municipal Congress

Chicago, Ill.—Plans for the International Municipal Congress and Exposition, which will be held in Chicago next September, received a big boost last week when nearly sixty cities accepted invitations to participate in the big event and send exhibitions. The cities epitomize the enthusiasm and co-operation which is being shown in the congress. Controller William A. Prendergast, of New York, will contribute an address on municipal financial systems. His acceptance of the invitation has been received.

Prizes for Well Kept Lawns.

Cincinnati, O.—For several years the Hyde Park Business Club has arranged a contest and awarded prizes for the best kept lawns. This has induced individual effort and has resulted in producing many beautiful lawns. This year the sphere of influence is to be extended. Individual contests will be dropped and instead the unit to be considered will be a whole square, including both sides of the street between the nearest intersecting streets.

Mayors Will Gather to Honor Spokane's Executive

Tacoma, Wash.—Mayor W. W. Seymour is arranging for a gathering of the chief executives of all the cities west of the Cascades and a number of those east of the mountains at Seattle in June, in honor of Mayor Hindley of Spokane. The senior class of the University of Washington has chosen Mayor Hindley to preach the baccalaureate sermon, he having been a Congregational minister before entering political life last spring. Recently Mayor Seymour of Tacoma and Mayor George W. Dilling of Seattle decided that it would be a graceful compliment to the Spokane executive for a number of the mayors of Washington cities to attend.

Municipal Baseball Park is Proposed

Taunton, Mass.—Councilman Joseph L. Anthony is fostering a plan for a municipal baseball park for the use of schoolboy teams. Mr. Anthony put the plan before several of his brother members at City Hall after a meeting a day or two ago, and declared that if there was no law that stood in the way it would be a good investment. It would not be necessary to buy a lot, but as the councilman thinks, a place could be secured at a reasonable cost for the high school team on the days when they have the games and for the juvenile school organization at other times, the dates to be secured by application to the superintendent of schools or whoever might be designated in charge.

City Improvement Plans Exhibited

Albany, N. Y.—Drawings of the plan of Architect Marcus T. Reynolds, chairman of the Albany 1916 committee on river front improvement, have been placed in the office of William B. Jones, of the Chamber of Commerce, for inspection. President McKinney is expected to name a special committee of three within a few days to study the plans and report on them. The executive committee of the Albany 1916 movement, for which the plans were prepared, will also pass on them and report to the general committee. A new feature of the plans is the suggestion made for the acquisition of the block bounded by Broadway, Steuben, Columbia and James streets as a traffic square and trolley terminal. A circular plaza is provided for at the foot of State street, about which the trolley cars will circle. This will include the site bounded by State street, Broadway, Quay street and Hudson avenue. A system of concrete docks is proposed in the basin from Maiden lane to the steamboat square, with covered sheds and freight facilities. As these facilities are needed they can be extended southward. A sewage disposal plant is provided for to receive the sewage from the northern section of the city at the north end of the basin. This plant is to be covered by a little park. An ornamental lighthouse is provided for at each end of recreation pier. The south end of the present pier is to be cut away and a larger entrance made to the basin at the foot of Maiden lane for the entrance of the Troy boats. A system of lateral docks is provided for in the basin from Maiden lane south to the steamboat square, with covered sheds and freight facilities. A platform is to extend from the foot of State street to the recreation pier, curving to the north and run parallel to the Maiden lane bridge.

Bonds for Playgrounds

Columbus, O.—Columbus and other cities that take pride in their playgrounds and civic centers can rejoice over the action of the Governor in signing the bill legalizing bond issues for playground purposes and for recreation centers. The bill corrects an omission in the law by allowing councils to issue bonds for the above purposes. In Columbus the recreation bureau has been crippled for funds owing to the legal defect and has been compelled to postpone the opening of many of the summer playgrounds, bath houses and various civic centers. Money will be now available.

Children's Court Plan is Approved

Richmond, Va.—As a substitute for an ordinance referred providing for holding a special term of the Police Court in the afternoon twice a week for the trial of juvenile offenders, the Council Committee on Ordinance, Charter and Reform has recommended an ordinance strongly recommended by the Juvenile Protective Association and several other societies, which conforms to State laws recently enacted with regard to delinquent children. The first clause provides for the appointment of a special probation officer, preferably a woman, though the ordinance does not so state, the salary being placed at \$1,200. The second clause provides that the judge of the Hustings Court may designate three police officers for special service as probation officers in carrying out the work outlined, this power having already been given to the judge of the Hustings Court by State law. The third clause provides that in order that no child under seventeen years of age, when arrested for any offense, shall be confined in jail previous to trial, the Finance Committee is empowered to enter into a contract on a per diem basis, for the detention and care of such children, previous to trial, with some approved home of detention or charitable society having such powers under its charter. The fourth clause provides that the Police Justice of the city of Richmond shall hold a special session of his court every day at noon, whenever necessary, for the hearing of juvenile and non-support cases.

Deep Channel Plans Ready

Philadelphia, Pa.—Plans and specifications for the 35-foot channel from Philadelphia to the sea, the United States engineers announce, have been completed and proposals for starting the work on the Tinicum and New Castle Ranges will be opened soon, by Major Herbert Deakye, United States engineer in charge of the deeper water improvements on the Delaware river and bay. The 35-foot channel project will insure deeper water and enough to float vessels of all sizes bound to and from Philadelphia's ports necessary for the increasing commerce.

Museum Buys Vinton Canvas

Boston, Mass.—Frederick P. Vinton's "Gray Landscape," painted in France several years ago and before he had practically abandoned his landscape work to devote himself to portraiture, has been purchased by the Boston Museum of Fine Arts. This is one of the first paintings to be bought with the fund of \$200,000 set aside for the purchase of pictures when Jean Guiffrey came over from the Louvre Museum to take charge of the department.

Experiments to Be Made in Planting Foreign Trees

Crowley, La.—The Rice Experiment Station has received fifty varieties of trees and shrubs, some of which are for ornamental purposes and others fruit-bearing trees, from the Department of Agriculture. They have been set out at the station with the object of ascertaining their adaptability to the soil and climate of the gulf coast. The Department of Agriculture will distribute samples of such of the trees and shrubs as are found suitable to this climate and soil.

No Rubber Stamps For Councilmen

Spokane, Wash.—The city commissioners have concurred in Commissioner Fassett's recommendation that the rubber stamp and pencil be abolished by city officials for signing papers which become a matter of record. Commissioner Coates is granted a special dispensation in being allowed to have his chief clerk sign the commissioner's name with a rubber stamp, by certifying it with his own name underneath.

Weed Campaign Ordered by Law

Spokane, Wash.—County officials, with assistance of the prosecuting attorney, will try to do away with the weed nuisance. After June 9 it will be a misdemeanor, punishable by a fine or imprisonment, for a property owner to allow noxious weeds to grow upon his property. Under the old law, which is still in force, the road overseer of each township is required to notify property owners to cut down and destroy the weeds growing on their property, such as Russian thistle, tumble weeds, "Jim Hill" mustard, cockle burrs and other weeds which may be detrimental to the agricultural interests. Upon the failure of the property owner to comply with the notice, the overseer is required to destroy the weeds himself and send a bill to the property owner. Upon failure of the property owner to pay the bill within 30 days, the overseer may present his claim for labor to the county commissioners, whereupon the claim is paid and taxed against the property, to be collected with taxes for the ensuing year. It also is a misdemeanor for the road overseer to fail, neglect, or refuse to enforce the law.

Concrete Foundation of Bridge Floats

Kansas City, Kan.—West Kansas avenue is carried across the Kaw River on a typical long span steel highway bridge, supported on steel caissons filled with concrete. Two of these steel caissons at a point well above flood waters began recently to swell in an unaccountable manner, until finally a sheet in one cylinder burst open. This was at first attributed to the action of severe frost, but it was soon observed that the contents of this cylinder was disintegrating with the jar of traffic on the bridge and gradually falling out of the rent in the steel sheets and floating away like pumice stone on the surface of the river. When a cavity of about 10 cubic feet was made in this way the authorities took steps to repair the piers. At the same time they started an investigation of this floating concrete, which is still in progress. While awaiting a full report it is interesting to note that on the bank of this river, not 500 feet from this bridge, is a large factory engaged in making a soap which floats, and its discharge sewer flows out almost under the bridge and at certain stages of the water deposits a white limelike sludge along the banks, which is often piled knee deep. A sample of this peculiar material was sent to the MUNICIPAL JOURNAL by Benjamin Brooks. The material is light, easily friable and somewhat resembles pumice stone and has few properties in common with ordinary concrete. A small piece thrown in water will float for a minute or two, gives out bubbles of air and finally sinks.

City Appropriates Money for Park Fetes

Rochester, N. Y.—Money for the water carnival in Genesee Valley Park on July 12, during the Shriners' convention, and for the big musical festival in Seneca Park in August, was appropriated by the Park Board at the regular monthly meeting. The sum set aside for the musical festival was \$1,500 and \$1,300 was the amount appropriated for the water carnival.

Mayor Favors Tax League and Investigation

Tacoma, Wash.—The proposition to organize a tax league and appoint a committee to investigate tax conditions of the city has been indorsed by Mayor Seymour. His indorsement of the plan was given to a committee from the Central Improvement League, which started the movement for the organization of a tax league. The committee asked Mayor Seymour to appoint at once a committee of five to investigate the city's taxes, budgets, levies and general taxation methods and make a report on its investigation. The Mayor was adverse to appointing such a committee at once. It would be difficult to find men willing to serve on such a committee without compensation, he said, and suggested that before a committee be appointed to begin the exhaustive work necessary to start investigating the city's books and taxation records that a fund be raised for payment of the investigating committee members. The Mayor also asked that other representative bodies and organizations be interested in the plan before requesting that he appoint the committee to investigate general taxation conditions in the city.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Defective Street—Injury—Sufficiency of Notice

City and County of Denver vs. Perkins.—A notice of injury to a traveler sufficiently designated the place in the street where she was injured as being on a named street, between two other streets, "where the sidewalk intersects the alley and where a curbing was being put in," and was not insufficient for not stating the particular side of the street.—Supreme Court of Colorado, 114 P. R., 484.

Extension of Water Mains—Indemnity

Town of Claremont vs. Rand et al.—An instrument reciting that the signers thereof agree to guarantee the 8 per cent. required by a town to extend a water main, executed after the town authorized the extension if the people along the line guaranteed 8 per cent. on the expense of extension guarantees an annual rental of 8 per cent. on the expenses of the extension. An action in assumpsit on the instrument against the signers thereof to recover the difference between the annual rental and the 8 per cent. of the cost of the extension is an adequate remedy and the town may not sue in equity.—Supreme Court of New Hampshire, 79 A. R., 689.

Water Company's Contract—Changing Rates

City of Independence v. Independence Waterworks Co.—A water company's charter constitutes a contract between the company and the city served which the city cannot alter without the company's consent. Where rates charged by a water company can be changed only by agreement between the company and the city, the company will be restrained from charging an increased rate agreed to by the city on condition that no meter rental charge be made, where the company refuses to abide such condition.—Kansas City Court of Appeals, 135 S. W. R., 956.

Private Fire Alarm Company—City Wires

Foy vs. City of New York et al.—The fire commissioner of the city of New York, in the absence of statute prohibiting it, has power to permit the Manhattan Fire Alarm Company in the discharge of its business to connect its wires with the city fire alarm telegraph system, so as to communicate an alarm of fire directly to fire headquarters, instead of compelling notice to be given by pulling the signal in the fire alarm box in the usual way, thus saving time, this not being the loaning or granting of property by the city to a private corporation.—New York Supreme Court, 129 N. Y. S., 72.

Mandatory Ministerial Duties

Mayor and Councilmen of City of Pawhuska vs. Pawhuska Oil & Gas Company et al.—The Constitution providing that after a franchise has been voted to be granted by a majority of the qualified electors voting thereon the same shall be granted by the proper authorities at the next regular meeting of the legislative body of the municipality, imposes upon the Mayor and Councilmen a mandatory ministerial duty. The writ of mandamus is available to require the performance of such duty.—Supreme Court of Oklahoma, 115 P. R., 353.

Municipal Contracts—Labor Laws

Ewen v. Thompson-Starrett Co. et al.—That the portion of a contract for the erection of a building for a city which provides for the furnishing of the stone work is sublet does not affect the question whether the work on the stone, which is done in another state, is subject to Labor Law regulating the wages to be paid workmen on public works or materials to be used in connection therewith. Labor Law, providing that workmen on public works or material used in connection therewith shall be paid the wages prevailing in the locality within the state where the public work in its completed form is to be situated, does not apply to work done out of the state on the material.—New York Supreme Court, 128 N. Y. S., 595.

Public Improvements—Bonds—Injunction

Clouse et al. vs. City of San Diego et al.—San Diego City Charter provides that the Common Council shall determine the necessity for public improvements and that where the ordinary revenues are insufficient bonds may be issued, the proceedings for which shall be in accordance with the general laws relating to municipal bonded debts, but the charter is silent as to how money so raised shall be spent. Held that in the silence of the charter, the expenditure of the money was not a "municipal affair" within constitution, providing that city charters shall be controlled by general laws, "except in municipal affairs," so that the general law followed as to the mode of issuing the bonds for the improvement. Laws 1901, was controlling, which forbids spending such funds, except on competitive bidding.

In an action by taxpayers to enjoin the making of public improvements for which city bonds had been sold otherwise than by contract, let by competition, an answer which charges that plaintiffs were contractors acting in collusion in order that some of them might obtain contracts for the proposed work and profit thereby, but which wholly fails to plead any facts showing collusion, is bad on demurrer.

The mere fact that a method of paying for municipal work which is contrary to the statute might be expensive and wasteful and might preclude responsible contractors from securing it gives a citizen of the municipality a sufficient standing to maintain an action for an injunction to prevent the illegal expenditure.—Supreme Court of California, 114 P. R., 573.

Streets—Extent of Dedication

Provident Trust Co. vs. City of Spokane.—A deed of dedication of a town plat recited that the grantors dedicated as public highways "the streets as marked and described on the foregoing plat," reserving "the strip of land twenty feet in width marked 'R. R.' for railway purposes," etc. Such strip occupied the space between two streets, both named and definitely marked on the plat as being a certain width each; the boundaries of the intervening strip being also definitely marked and its width being also shown on the plat. It appeared that in grading one of the streets the city did not enter on the strip, but constructed a retaining wall along the line thereof. Held, that the strip was not dedicated as part of the streets. An intention to dedicate will not be presumed, but must clearly appear. If the meaning of an instrument is doubtful, the practical construction given it by the parties will be accepted by the courts.—Supreme Court of Washington, 114 P. R., 1030.

Opening Surface of Streets—License Fee

City of Buffalo vs. Stevenson.—Buffalo ordinances providing that before any permits for the opening of a pavement shall be granted the applicant shall pay to the city treasurer \$5 for every such opening, to be credited to the street repair fund, and that any person who opens any street or alley without permission, or who shall fail to comply with any of the provisions of this section, shall forfeit and pay a penalty of \$10, is not in violation of constitution prohibiting the taking of private property for public use without just compensation, for the streets are within the control of the municipality.—New York Supreme Court, 129 N. Y. S., 125.

Boundaries—Extension—Procedure

McBee vs. Town of Springfield et al.—Since by Constitution as amended June 4, 1906, cities and towns are authorized to provide the manner of exercising the initiative and referendum powers in municipal legislation, except that not more than 10 per cent. of the legal voters may be required to order the referendum nor more than 15 per cent. to propose any measure by the initiative, which section is self-executing, no enabling act being required to put it into operation, the general law requiring cities and towns to provide by ordinance or charter the manner of exercising such powers is advisory only, and where the Town Council adopted the manner prescribed by Laws 1893, requiring a petition for change of boundaries to be signed by not less than 20 per cent. of the qualified electors, and submitted the question to the voters as provided by such section, this was a reasonable exercise of the power.—Supreme Court of Oregon, 774 P. R., 637.

EXHIBITS AT AMERICAN WATER WORKS CONVENTION

The exhibits made in connection with the 31st annual convention of the American Water Works Association, June 6-10, were displayed in the corridors and adjoining rooms of the Powers Hotel. The main corridor is perhaps 60 feet long and 20 feet wide. On both sides of this were tables on which the various devices were shown. The main corridor leads into an office or lobby perhaps 60 feet square. On two of the sides of this were arranged the exhibitors' tables and in two large rooms opening from the lobby besides. The unusual publicity given the exhibits had its advantages and disadvantages. Many people passing by the hotel were attracted by the show, so that in a way it had a popular feature and presumably accomplished some of the ends of a municipal budget exhibit. The many tables, covered with water meters of all sizes and descriptions, must have brought the matter of water conservation forcibly to the minds of many people who had hitherto given it little thought. Notwithstanding the publicity there was ample time and room for members of the association to study the devices they were interested in without serious interruption.

Water Meters

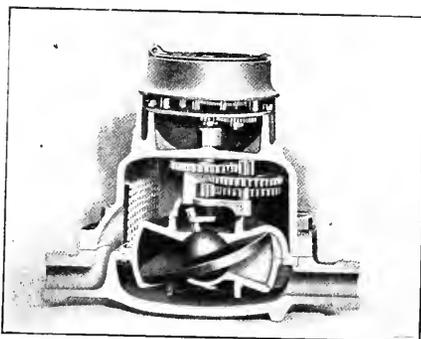

Water meters were the appliances most in evidence; perhaps the tables holding them occupied a third of the total floor space. Altogether, eleven meter manufacturers were represented. The total number of exhibitors of all devices was 53. In this account are not included the Pitometer and Venturi meter, although they, too, may be used for individual installations. The importance of the meter question was indicated also by the number of meter accessories, such as meter boxes, meter seals and meter testing machines. All sizes of meters from smallest to largest were shown. Complete meters were shown and meters taken apart showing the working mechanisms. In other instances the casing was cut away, showing sectional views. Photographs, diagrams and reading matter were also used to explain the strong points of each. The fact that the meters were not new in design—the writer only noticed one that was actually new—did not prevent them from being objects of considerable interest to the members of the association. In fact, there seemed to be a strong desire to learn details of design and construction of different meters, with a view to consideration of questions

of comparative accuracy and cost of maintenance.

Reproductions and brief descriptions of many of the meters shown follow.

Disc Meters.—A disc meter is a meter in which a hard rubber disc nutating in a chamber receives a definite quantity of water between the disc and the bottom of the chamber. This unit of water as the disc nutates is passed on around as chamber and out at an orifice near the point where the water enters. Nearly all house meters are disc meters.

The Badger meter is made by the Badger Meter Manufacturing Company, Milwaukee, Wis. One of the chief merits claimed for this meter is the frost bottom, which consists of a plate of soft gray cast iron, thoroughly galvanized and rust proof, with a low breaking strength of 600 pounds. In case the meter should be frozen the ice breaks the bottom plate, thus relieving all strain before the pressure has reached a point where it is dangerous to the interior parts. The bottom plate can be renewed at a cost of a few cents. The frost bottom is held firmly

BUFFALO

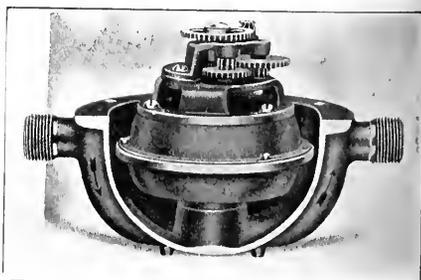

in place by means of four strong toggle bolts, which, when removed, expose the bottom of the measuring or disc chamber. All parts of the meter, except the bottom, are constructed of hard tough bronze. The intermediate train gears, pinion gears and pinion rods are of phosphor bronze.

The Buffalo Meter Co., Buffalo, N. Y., exhibited their American and Niagara meters. The measuring chamber of these meters is made of the best bronze and cast and machined in halves. It rests upon a seat formed in the base, and upon opening the meter at the bolted flanges may be at once removed. It may be slightly rotated upon its seat so as to cover more or less of the outlet in the base and thus regulate the meter for unusual water pressures. The disc is made of hard rubber nearly as light as water. No reinforcements or extra parts are used to increase its weight, but the requisite strength is secured by making the central ball large, to provide ample bearing surface and by making the flat web thick. The intermediate gearing is accessible on removing the outer casing. The gears turn on long phosphor bronze pins, mounted with the driver and disc control upon a simple removable plate. Each gear is composed of a large driven gear and a small driving pinion; the pinion is fluted, pressed into the fluted hole of the gear and riveted, so they will not come apart nor the pinion turn in the gear. The tooth faces are broad and the gear circumferences large. Two kinds of indicators are in general use—the

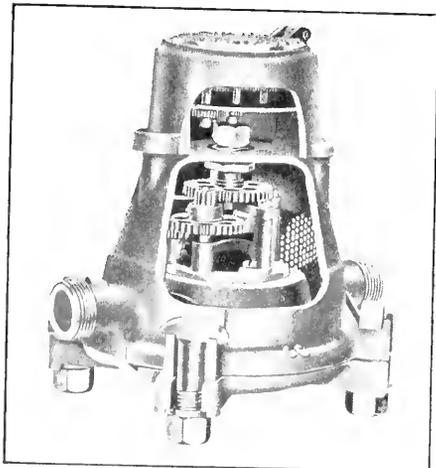

Standard, which has a continuously moving mechanism, and the straight reading, which has an intermittent mechanism. Both kinds are accurately made and positive in their action. The entire outside casing of the Niagara meter is made of a fine grade of cast iron carefully galvanized. This is the only feature that distinguishes the New Niagara from the American, as all other parts are alike.

The Gamon Meter Co., Newark, N. J., exhibited their Watch Dog meter. In this meter the area of the measuring chamber has been increased until for one cubic foot of water passed the piston makes only 235 revolutions. The measuring chamber is machined with great care and the piston disc is fitted with great accuracy, some of the clearances being only one five-hundredth of an inch. The disc has a roller thrust bearing holding it in position with the least friction. The joint formed between the pedestal in the lower casing and the disc chamber hub is an ordinary metal joint, screwed into a 3/4-inch pipe tap thread, the land around the top of the thread being about one-quarter of an inch. This small area, to be made water-tight in connection with a double bottom in the disc chamber, renders it absolutely impossible to cramp the piston at any time. To assemble or take the disc chamber out it is simply necessary to use a screwdriver as a lever and unscrew or tighten the joint. The chamber is circumferentially free from the casing, allowing a free passage for water. The strainer fits tightly over the pedestal and against the wall of the casing, having an effective area of over twenty-six times the area of the pipe, heavy particles falling by gravity to the bottom of the containing case. The gear train has all the bearings bushed with hard vulcanized rubber and has a reduction of 168 to 1. The stuffing box is internal and kept in place by the pressure by a hard rubber plug ground into a bronze bearing. The higher the pressure the tighter the joint. The flange bolts within the casing. The joint is formed have a device which distributes the pull upon four points instead of under the head of the screw only, thus avoiding springing.

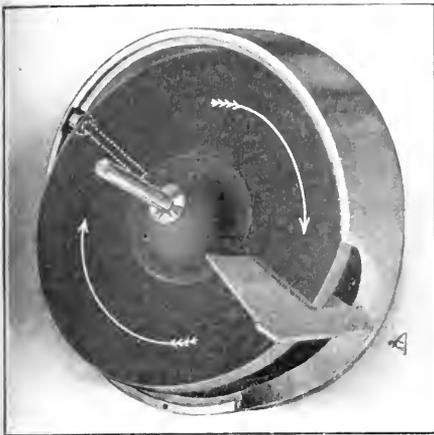

The Neptune Meter Company, New York, exhibited their Trident meter. If one characteristic feature of this old and well-known meter were to be picked out it would be the friction roller bearing which resists the circular thrust of the disc-piston. That is, in order to prevent the revolution of the disc which interferes with the regularity of the nutations, the disc is held in position by a pin located opposite the ports. This pin is provided with a roller which moves in a groove in the disc casing. By avoiding friction the accuracy of registration is increased. This roller device adds to the

GAMON

BADGER

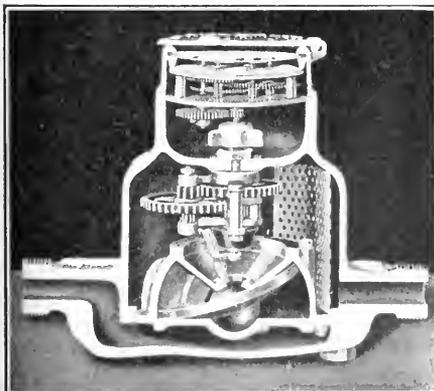

DISC OF TRIDENT

life of the disc-piston, which, in the Trident, is said never to break. The gear train consists of heavy bronze castings accurately machined. The driving pinion spindle revolves in a long hard-rubber bushing. The meter is provided with a device which prevents damage from freezing; a light casting cheaply replaced breaks and relieves the pressure.

The Pittsburgh Meter Company, East Pittsburgh, Pa., exhibited the Keystone disc meter. The illustration shows the D. C. type, which is now made with all bronze outer cases. Formerly these meters were made with galvanized iron upper cases. In other respects the meters are the same and all parts interchangeable. The intermediate gear construction is considered by this company as the most vital part of the meter. In the Keystone the shafts are held in accurately-made journals, while the weight of each element is carried by the sharp pivot resting on the step surface, with only a point contact. The first pinion and wheel of the train have a larger pitch and also a greater face than the second and third wheels, in order to take up the increased wear due to the higher speed at which the first wheel operates. The measuring chamber is supported in the lower case by lugs, and is held in position, without the aid of screws or bolts, by the upper case bearing on a shoulder cut in these lugs. When the upper section is removed, the measuring chamber can be immediately taken out without any annoyance of removing screws, etc.

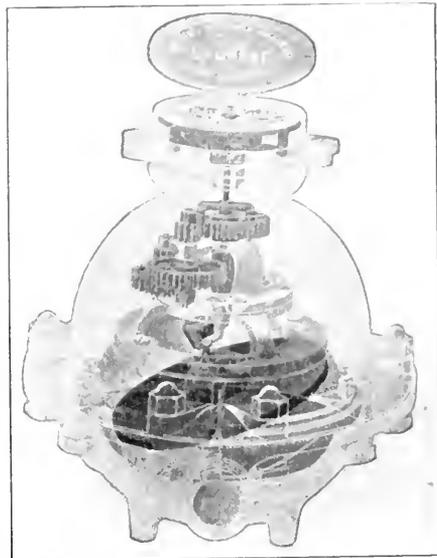

The Standard Water Meter Company exhibited a disc meter; but as their leader is a current meter of rather remarkable construction which adapts it for small services such as are usually provided with disc meters, no description is given of their disc meter.

HERSEY

The Thompson Meter Company, Brooklyn, N. Y., exhibited their Lambert disc meter. The phantom view herewith reproduced gives an excellent idea of the construction. The measuring chamber of the Lambert is large, tending to reduce friction and wear. The internal gear train consists of four gears and four pinions. The gears and pinions are made with very heavy teeth cut by special machinery, all wheels being 5/16 of an inch thick at the toothed portion or periphery, cast of semi-hard bronze composition. The four pinions are made of hardest grade phosphor bronze. The central axis or pivots of the gear are made of hardest wire-drawn phosphor bronze journaled freely at both ends in composition bearings of from 5/16 to 7/16 of an inch deep.

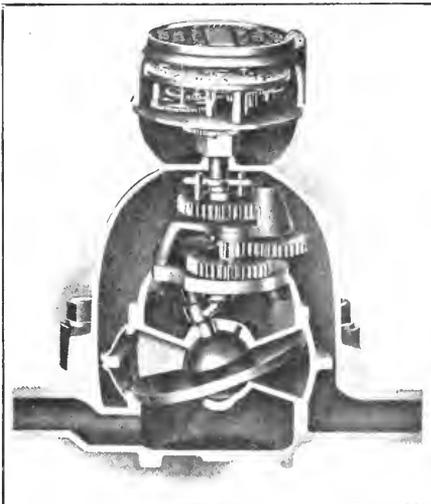

The Union Water Meter Company, Worcester, Mass., exhibited their King disc meter. In this meter all internal moving parts are assembled in a single working unit, readily accessible for inspection without removing the meter from the service pipe. The bearings of moving parts are of generous proportions and are protected from the entrance of abrasive material. The measuring chamber is large. Inlet and outlet spuds are low, thus allowing water to drain from

LAMBERT

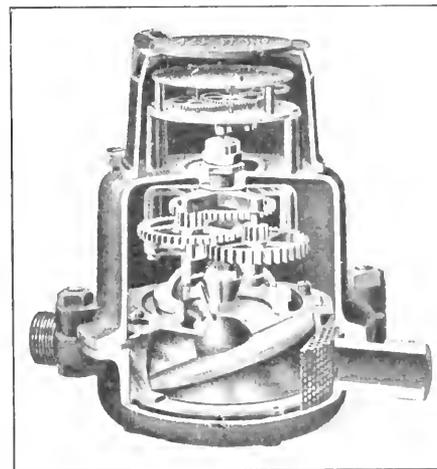

and outlet connections of the King are brought into vertical alignment, while the mechanism remains in its normal position. A vertical setting is thus obtained without sacrificing either sensibility or durability. The only point of difference between this meter and the regular horizontal model is in the lower section of the casing, and an interchange of the two styles may be easily made.

Henry R. Worthington, New York, exhibited the Worthington disc meter. One feature of this meter is an opening in the bottom casting, under the ball bearing of the disc, which provides egress to the settling basin in the bottom for any fine silt or sand carried by the water. The top outside casing is made of galvanized iron or brass. The bottom casting of the smaller sizes, carrying the inlet and outlet spuds, are usually made of composition, and the main body or bottom castings of the larger sizes of iron, galvanized. In all sizes the pipe openings are on the lower casting. The company makes a specialty of furnishing meters of special composition to resist the chemical action of waters carrying elements which attack ordinary brass compositions containing zinc. The intermediate train of gearing is securely anchored upon the disc chamber. The first spindle which carries the driving pawl has a long bearing in the bottom plate and also in the top plate. Both of these bearings have bushings made of fine quality of rubber. This spindle carries a large, heavy, hard

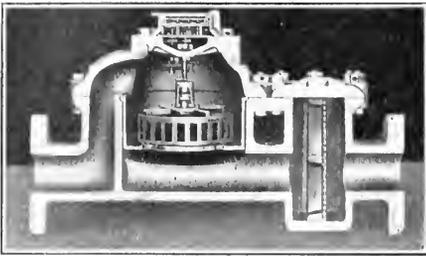

KEYSTONE

the meter to a point where damage from freezing is impossible. The spuds being a part of the lower section of the casing it is not necessary to disturb pipe connections in opening the meter for examination. The manufacturers of this meter contend that the breaking of meter discs is generally caused by unequal pressures within the chamber resulting from improper proportioning of ports. They argue that the disc of the King, unhampered by the added weight of reinforcements, has the lightness and activity necessary to respond to small flows of water, while under large draughts it is not subject to damaging stresses set up by its own action. The disc control is effected by a single hard rubber roll mounted on the disc spindle, coating with a stationary cone. The gear train, composed of accurate, machine-cut hard-rubber gears and bronze pinions, presents antifricition and long-wearing qualities. As hard rubber is of nearly the same specific gravity as water the weight of the gears is inappreciable. A modification of the ordinary meter is the King vertical, which is made to be set in a vertical pipe. This makes the plumber's bill for setting low and it is easy to read the index. By a simple arrangement of water passages the inlet

KING

HERSEY CURRENT

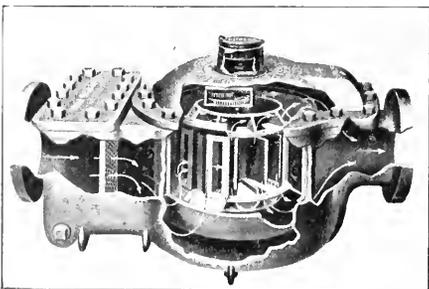

phosphor bronze pinion, which engages with the first gear. This first gear, being the fastest running, is made with an extra wide face. The gear has the No. 2 pinion pressed in and the spindle is then pressed in the pinion, making the three parts as one. Gear No. 2 has the same long bearings in the top and bottom plates. No. 3 gear is rubber bushed and is journaled on a boss on the top of the upper plate. Openings in the web of this gear permit of the entrance of the prongs of the intermediate pawl.

Current Meters.—Current Meters are variously described as current, velocity or inferential type. In this class the volume of water passing is inferentially ascertained by recording the number of revolutions of a reaction wheel or propeller which is arranged to be revolved by flowing water at a speed proportional to the velocity of the flow. Current meters are generally used for measuring large volumes of water.

The only new meter exhibited which has not actually been placed on the market is a current meter made by the Gamon Meter Company, Newark, N. J. This meter has a single set of propellers in the place of the two sets usually employed. A complete description of this meter will be given in the MUNICIPAL JOURNAL at some later date.

The Hersey Manufacturing Co., South Boston, Mass., exhibited their Torrent meter. In this meter the piston is the only moving part in the measuring chamber and is in the form of a horizontal wheel with curved vanes made of vulcanized rubber. The measuring chamber in which the wheel revolves is of bronze composition with phosphor bronze spindle and vulcanized rubber renewable bearings and bronze screws. The intermediate train which communicates the motion of the piston to the register is made of bronze throughout, with phosphor bronze spindles and screws and vulcanized rubber bearings. All working parts are held in a substantial outer case from which they are easily removable. All sizes are provided with strainers or fish traps forming part of the external case which are accessible for cleaning without disturbing the working parts of the meter.

The Neptune Meter Company, New York City, exhibited their Trident-Crest water meter. The essential features of

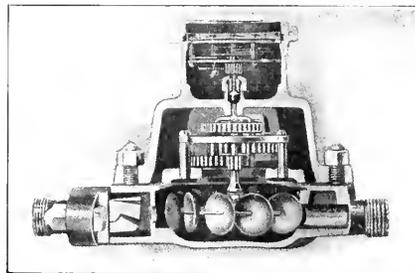

EUREKA CURRENT

the Trident-Crest water meter are the vertical position of the axis, and the mounting thereon of two propellers having helical blades formed on their edges—one a right hand spiral and the other a left hand spiral—which cause the inflowing stream to divide and flow to both the propellers in equal volume and at equal velocities. After the two streams have passed through the spaces formed by the helical blades, causing the propellers to revolve, they meet in equal volume and at equal velocity, head on, react upon themselves, radiate in all directions, and pass out at a right angle to the line of impact, through the ports of the circumferential casing to the large receiving chamber of the main casing, and thence on to the outlet spud.

The Trident-Compound meter, shown in the illustration, is a combination of a 6-inch current meter and a small disc meter. Small volumes of water go through the disc meter. Larger volumes raise a valve, shutting the disc meter out of circuit and passing all the water through the current meter.

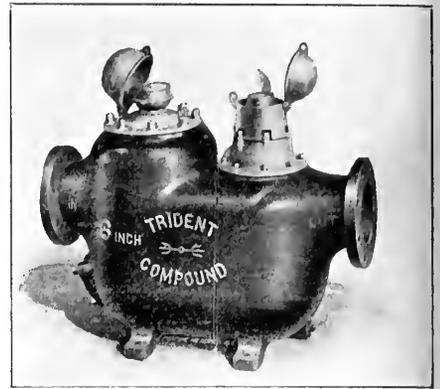

The Pittsburg Meter Company, East Pittsburg, Pa., exhibited their Eureka meter. The sectional view here reproduced shows by means of arrows the route taken by the water. The inflowing stream first passes through a strainer placed at the inlet end of the lower outer casing, is then conducted to the compartment surrounding the measuring chamber through ports located diametric-

SAPPHIRE

ally opposite each other, and enters the measuring chamber through tangential ports equally spaced around the walls of the chamber. The contact of the water upon the vanes of the wheel made of hard rubber rotates it in a horizontal plane at a speed which is proportional to the velocity of the water. A suitable crank on the top of the piston communicates the motion of the piston to the intermediate train, which in turn transmits it through a stuffing box to the registering device located on top of the meter. After its contact with the vanes of the wing wheel or piston, the inflowing water is equally divided into streams which pass out of the measuring chamber through the outlet ports in its top and bottom plates, to a common outlet in the lower outer casing. The intermediate train of gears is of the same stepped-bearing construction already described in the Keystone meter.

The Standard Water Co., New York City, exhibited their Sapphire meter. Although this is a current meter, it is made in small sizes and competes with disc meters for house services. The general outlines of the small size Sapphire are similar to those of an ordinary disc meter. In the place of the disc, however, is a device consisting of a series of cups, a cup plate and a spindle which rests on a jewel bearing. The plate and cups revolve in a casing. The water as it enters the meter from the port impinges against

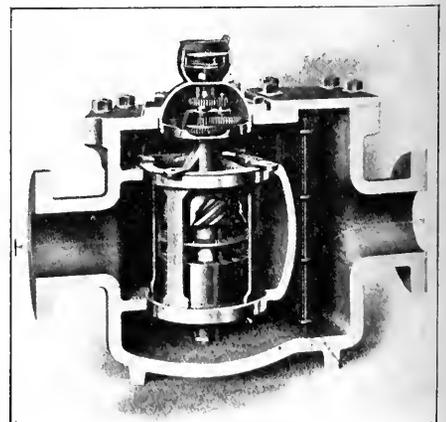

TRIDENT COMPOUND

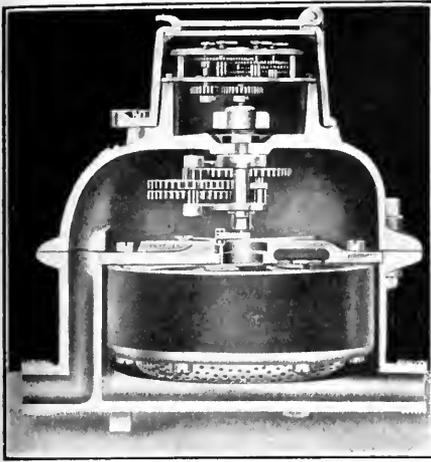

the cups and starts them in rotation, the motion being transmitted and recorded in the usual way. In order to make the meter sensitive even to very small currents there is a lip at the inlet port of the meter which drops when not in use and closes the inlet. Even so slight a hydraulic pressure as a quarter of a pound six inches head, lifts it. The effect of this device is to confine a small inflowing current to a definite area so that as it strikes the discs they will revolve. Hot water flowing back from a boiler will not injure this device as it will a rubber disc. The bodies of these meters up to and including 3-inch size are made of bronze.

The Union Water Meter Company, Worcester, Mass., exhibited their Nilo meter. This meter has a hard-rubber piston, in two sections, the upper having right and lower left hand helical vanes, the two halves being separated by a deflector plate insuring discharge of equal volumes of water from upper and lower halves of piston. The vanes are encased in a rubber shell. Interior of piston is chambered in which is placed a buoyant material which relieves weight of bronze shaft and pistons on step bearing. As vanes of piston are inclosed by the integrally revolving shells no water can pass through meter without actually passing through piston. Intermediate gearing has bronze pinions and spur gears of a specially compounded non-corrosive material, very nearly as light as water, hard, durable and fully guaranteed. Gearing is protected from possible accumulation of rust by the bronze dome, on which rests register and case. Inlet chamber of meter is provided with a screen of the bar type.

Henry R. Worthington exhibited the Worthington Turbine meter, which is a development of the turbine pump. The water enters the casing through a side

NILO CURRENT

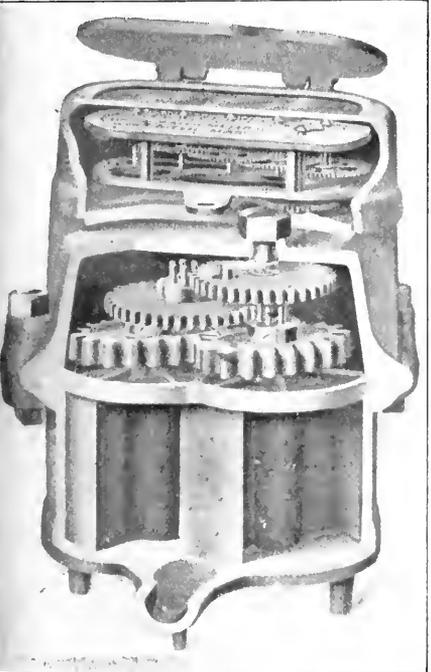

HERSEY DISPLACEMENT

strainer; the column then divides, flowing to both sides of a double wheel. The wheel is surrounded by a chamber of the volute pattern.

Displacement Meters.—Displacement meters are rotary meters which measure the water in compartments in a piston revolving in a measuring chamber.

The Hersey Mfg. Co., South Boston, Mass., exhibited their rotary meter, which is a positive displacement meter. The piston is the only moving part in the measuring chamber and is in the form of a six-toothed gear, made of vulcanized rubber. The measuring chamber is made of vulcanized rubber and bronze composition. The intermediate train is made of bronze throughout, with phosphor bronze spindles and screws and vulcanized rubber bearings. These meters are made in sizes from $\frac{3}{8}$ to 2 inches.

The Union Water Meter Company, Worcester, Mass., exhibited their rotary piston meter, varying in size from $\frac{5}{8}$ to 12 inches. The meter derives its name from its fundamental principle: the rotation of two pistons on vertical axes. These pistons, mutually controlled in their respective chambers by means of elliptical gears, constitute the entire meas-

UNION METER CO.

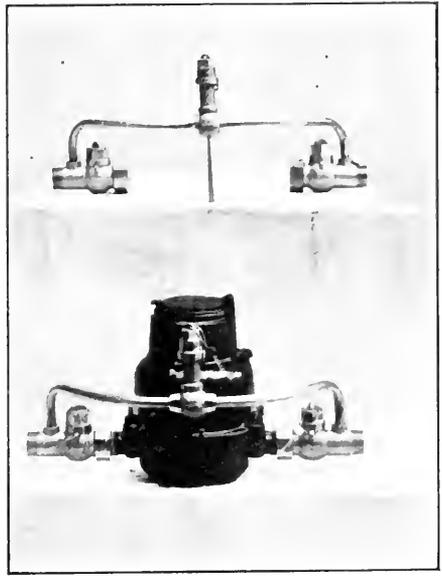

uring mechanism of the meter. A simple gear train transmits their motion to the register. The construction of the rotary meter allows practically uninterrupted flow of water, and the action of the pistons being continuous and positive, accurate measurement with a minimum of retardation is insured. No wear takes place in the measuring chambers, consequently they retain their original dimensions, and the accuracy of the meter remains unimpaired during long periods of service.

Water Meter Attachment and Protector

The H. B. Van Order Attachment and Water Meter Protector Co., Ithaca, New York, exhibited a number of rubber disks taken from water meters that had been distorted by the action of hot water. This is an accident which may occur particularly when the meter is located close to a boiler either in a power plant or even in a residence when the boiler becomes overheated. The protector not only prevents hot water from entering the meter but prevents anyone from reversing the meter and thus virtually stealing water. The illustration shows the attachment separately and as attached to a meter—in this case a Trident. There are three check valves, one on each side of the meter between it and the meter and the other in the middle of the bypass. The check valve on the boiler side of the meter prevents water from returning through the meter. The check in the bypass will allow back flow of water if the pressure is sufficient. If the meter is reversed the check normally on the side towards the main prevents water from passing through to the consumers' fixtures.

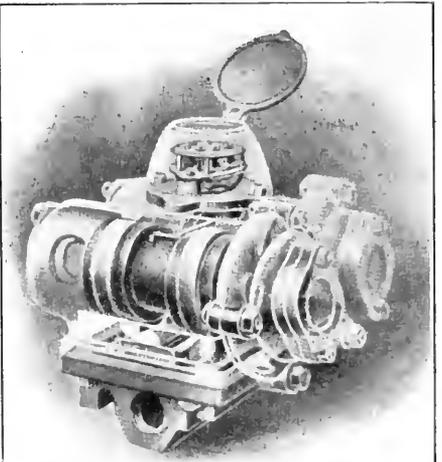

Exhibits at American Water Works Association Convention

- ALLYNE BRASS FOUNDRY Co., Detroit, Mich.—Corcoran lead pipe couplings.
- AMERICAN ASPHALTUM & RUBBER Co., Chicago, Ill.—Samples of asphaltum, showing its remarkable flexibility and rubber-like qualities. Photographs and printed matter showing waterproofed reservoirs and methods of construction. Pipe dip.
- BADGER METER MFG. Co.—Water meters.
- L. M. BOOTH Co., Chicago, Ill.—Photographs and literature explaining the Booth water softener.
- JAMES BOYD & BRO., Inc., Philadelphia, Pa.—Rotary valve seats.
- BUILDERS IRON FOUNDRY, Providence, R. I.—Venturi tubes and meters. Model installation for measuring boiler feed water.
- BUFFALO METER Co., Buffalo, N. Y.—Water meters.
- CENTRAL FOUNDRY Co., New York, N. Y.—Universal pipe, a cast-iron pipe made in short lengths with machined joints.
- H. W. CLARK Co., Mattoon, Ill.—Meter boxes.
- COLUMBIAN IRON WORKS, Chattanooga, Tenn.—Meter boxes, valve boxes.
- EAST JERSEY PIPE Co., New York, N. Y.—Section of bar lock pipe.
- EASTERN MFG. Co., Elmira, N. Y.—Samples of wood stave pipe, sections showing method of construction.
- FAIRBANKS Co., New York, N. Y.—Fire hydrants.
- FORD METER BOX Co., Wabash, Ind.—Sectional view of meter box.
- GAMON METER Co., Newark, N. J.—Water meters.
- GLAUBER BRASS MFG. Co., Cleveland, O.—Goosenecks, brass stop cocks, corporation cocks, etc.

WATER METER PROTECTOR

- GOULDS MFG. Co., Seneca Falls, N. Y.—Two single-stage centrifugal pumps.
- HAYS MFG. Co., Erie, Pa.—Payne's patent tapping machines. Hays Fire extension service boxes.
- HERSEY MFG. Co., South Boston, Mass.—Water meters.
- INTERNATIONAL STEAM PUMP Co.—Water meters.
- INTERNATIONAL SEAL & KNOT PROTECTOR Co., New York, N. Y.—Device for sealing meters with a wire and seal to prevent tampering with the dials.
- JENKINS BROS., New York, N. Y.—Valves, automatic, equalizing, stop and check valves.
- KENNEDY VALVE MFG. Co., Elmira, N. Y.—Gate valves.
- LEADITE Co., Philadelphia, Pa.—Composition for jointing cast-iron pipes.
- LEAD LINED IRON PIPE Co., Wakefield, Mass.—Sections of lead lined pipe, special fittings, couplings, etc.
- L. J. LOWE, Clarksville, Tenn.—Lowe automatic self-locking meter box.
- MODERN IRON WORKS, Quincy, Ill.—Snow quick repair stop box cover, wireless pipe locator.
- H. MUELLER MFG. Co., Decatur, Ill.—Three sizes of tapping machines, water meter testing machines, portable lead furnace, valve box, brass fittings, kit of tools, Mueller's sprinkler and flushing hydrant for obtaining water for flushing streets. The box is level with the surface of sidewalk or pavement, presenting no unsightly

WORTHINGTON

obstruction to traffic. This company reports great interest in its meter testing machine, two orders for them having been actually placed. The machine has a device by which very large meters may be tested. All water passing through the meter is actually weighed.

MUNICIPAL JOURNAL, New York, N. Y.—Magazines.

NATIONAL WATER MAIN CLEANING Co., New York—Sample of incrustated pipe. Physical objects removed from pipes. The company gave a demonstration of water main cleaning at a convenient point during the convention.

NEPTUNE METER Co., New York, N. Y. Water meters.

NEW YORK CONTINENTAL JEWELL FILTRATION Co., New York, N. Y.—Photographs and literature describing different types of rapid mechanical filters and machinery for the chlorination of water.

PENNSYLVANIA SALT MFG. Co., Philadelphia, Pa.—Sample of chloride of lime. Drums in which chemicals are shipped.

PITOMETER Co., New York, N. Y.—Model pitometer installation for recording flow of water in mains. New prism attachment increasing accuracy of readings. Literature explaining operation and results.

PITTSBURG FILTER MFG. Co., Pittsburg, Pa.—Photographs and literature.

PITTSBURG METER Co., East Pittsburg, Pa.—Water meters.

RENSSELAER MFG. Co., Troy, N. Y.—Corey solid stream frostproof fire hydrant, with casing cut away to show working parts. The valve is in the horizontal pipe leading to the hydrant and is controlled by a toggle joint. Rensselaer gate valves.

ROSS VALVE Co., Oakwood avenue, Troy, N. Y.—Regulating valves for steam, water and air. Large valves for street mains. Ross water engine.

A. P. SMITH MFG. Co., Newark, N. J.—Gate valves, tapping apparatus, hydrants, water meter testing machine.

G. H. SNELL, Attleboro, Mass.—Easy-on pipe couplings and tees.

SIMPLEX VALVE & METER Co., Philadelphia, Pa.—Water measuring devices.

STANDARD ASPHALT & RUBBER Co.—Sample of asphalt showing rubber-like consistency. Samples of waterproofing materials. Photographs and literature showing waterproofing of reservoirs. Pamphlet describing the 72-inch steel pipe line of the Brooklyn water supply lined with Sarco pipe dip. Pamphlet showing waterproofing of bridges.

STANDARD WATER METER Co., New York, N. Y.—Water meters.

THOMPSON METER Co., Brooklyn, N. Y.—Water meters.

UNION WATER METER Co., Worcester, Mass.—Water meters.

H. B. VAN ORDER WATER METER ATTACHMENT & PROTECTOR Co., Ithaca, N. Y.—Device for protecting meters from damage by back flow of hot water.

WATER WORKS EQUIPMENT Co., New York, N. Y.—Tapping machines, tapping sleeve and valve, corporation stop cocks, stop and waste and inverted key cocks, extension service boxes, emergency sleeves, Star pipe jointer, pipe cutters, gasoline lead furnace. The company gave a demonstration of its portable contractors' gasoline pumping outfit at a convenient point near the hotel. The members of the association who witnessed the test were favorably impressed with the capacity and portability of the machine.

A. WYKOFF & SONS Co., Elmira, N. Y.—Wykoff patent steam pipe covering. This pipe consists of layers of tin, asbestos, wood, corrugated paper, wood and asphaltum covering.

MUNICIPAL APPLIANCES

Vertical Thrust Multiple Stage Deep Well Pump

The accompanying illustration shows an installation of four Hill-Tripp vertical thrust, multiple stage deep well pumps at Chicago Heights, Ill., made by the Hill-Tripp Pump Company, Anderson, Ind. The installation is interesting because it is claimed that a world's record for deep well pumping was established here. The inside diameter of the well casing was 12 inches, the lift was 72 feet and the gallons pumped per minute was 2,780.

The action of the Hill-Tripp pump is similar to that of the propeller of a boat except that the water is moved forward instead of the propeller, and, with this

have no bosses, set screws, balance weights or obstructions on the inside. They are placed from three to four feet apart on shaft sections of nine and ten feet. Thus, if ten-foot sections are used, and the shaft is dropped 60 feet in the well there would be 18 impellers along the shaft. Deflectors are placed at proper intervals to retard the whirling of the water. Bands surrounding each impeller are held in place by connections that allow the largest possible diameter of impeller. A slight water space is left between band and impeller to prevent metal contact. No other bearings are required down in the well, all being hung from the head above. The speed of revolution varies for different conditions and sizes from 800 to

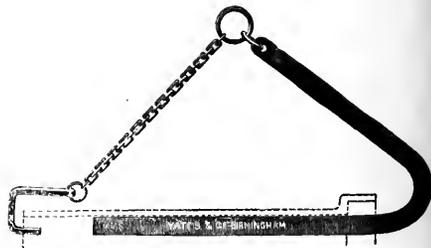

DEEP-WELL PUMPING PLANT, CHICAGO HEIGHTS, ILL.

device, in an upward course. A system of impellers are located at proper intervals along a vertical shaft extending down in the well to the proper depth. This shaft, with impellers, being revolved rapidly by means of a drive head at top of well with proper ball or roller thrust and lateral bearings to insure the minimum of friction wear and power. These drive heads are built for either vertical or horizontal belt drive or for direct attachment of electric motor, steam turbine or engine. In the Chicago Heights plant the vertical head drive with electric motor attached was used. The motor is provided with a thrust bearing to carry the weight of armature while head is fitted with ball thrust bearing to carry the weight of impellers, shaft and water. An improved oiling device is provided to keep the bearings submerged. The head is self-contained and heavy enough to absorb vibration and torsional strain. The sections of shaftings are connected with bronze screw couplings, the shaft revolving in the direction that draws them tight. Impellers can be made of iron or bronze, according to the nature of the water pumped. They are turned true and made of the proper pitch to insure the best lifting capacity and run in rings or bands of suitable dimensions arranged so as to utilize the largest diameter possible in the well, no moving parts coming in contact with the well casing. All parts in the well can be put in or taken out from the top of the ground through the base plate, and no pit or open shaft is needed. The impellers are turned true on the outer surface and

1,600 revolutions per minute. For a 12-inch well the head weighs 3,000 lbs., speed is from 800 to 1,000 revolutions per minute, rated capacity from 1,000 to 1,500 gallons for lifts of from 25 to 150 feet, and the horsepower required from 25 to 150.

Pipe Lowering Appliance

A handy device for lowering sewer pipe in a trench and aiding in the jointing process is made by John Yates & Company, Limited, Aston, Birmingham, England. It is generally used in connection with a small derrick, and is claimed to result in the saving of the labor of one man, besides decreasing the ordinary loss from the heating of pipes. The device is simply a band of iron, bent to an acute angle, and a clamp attached to a chain. The chain and one end of the iron band are attached to a ring, to which the line from the derrick is attached.

GRAPPLE FOR LOWERING PIPE

NEWS OF THE SOCIETIES

American Water Works Association.

—The annual meeting of one of the largest American societies whose field is a branch of municipal work gives rise to the query, "What is the function of the society and what was the meeting for?" Other societies, many of them, exist in this and other countries whose membership is made up of men engaged in municipal and engineering work. There is a difference, however, between American societies and those of foreign countries. This arises from the differences in administration of government. In England the Board of Trade exercises some supervision over city affairs. In Germany government control of city affairs is much greater than in England. In both cases, and in other countries, cities are kept in touch with each other by the publication of statistics, data for which the government has ample power to obtain, and by the control of expenditures, at least those requiring bond issues. In America in recent years cities are to some extent kept in touch with each other by a more or less efficient Census Bureau, a bureau hampered in its work for lack of authority. A few states in recent years, through accounting departments, have attempted to supply the deficiency which, it is generally felt, exists.

As having a bearing on this question, it is worth noting that many of our prominent educators, college professors and others who are looked on as leaders of thought return from trips to Europe, or the periods spent there as exchange professors, imbued with the idea that a strong central government, one that, among other duties, should exercise more control over city governments, is the great desideratum for this country. If they would study what is going on among municipal societies they would see how the need for closer association of municipalities is being efficiently supplied by technical societies, such as the American Water Works Association. At the Rochester convention delegates from all over the country, from Washington to Florida, and from Maine to Texas, met and discussed, under a guarantee of absolute freedom of speech, the most important problems regarding which there are differences of opinion, or any other problem regarding a detail, however small, which any member chose to bring up. The threshing over of these questions in such an assembly may develop in our water works department a degree of efficiency which even the power of a strong central government could not bring about, for there are dangers in bureaucracy, and authority is prone to suppress initiative.

That many of the delegates at the convention were conscious of the semi-governmental character of the society was apparent in the course of a discussion of the relations between water works departments, insurance companies and the city. Some members favored government supervision over these relations. But the question of freedom of speech in the society was promptly defended when a motion was made which was in effect in part a criticism of a fellow member who called in question the fairness of insurance interests in dealing with municipalities regarding the supply of water for fire protection. On the whole, it would seem as if the American system of initiative in management

would be promoted by the growth in influence of such associations as the American Water Works. It is to be hoped that, though the Rochester meeting was the most largely attended ever held, that the 1912 convention, at Louisville, Ky., will be still larger.

The thirty-first annual convention was formally opened in the banquet room of the Powers Hotel, Rochester, N. Y., Tuesday, June 6, by President John W. Alvord, Chicago, Ill. Mayor Edgerton welcomed the association, reminding it that Rochester took pardonable pride in its water works system, both as to the quality of its water and the equipment that delivers the un-failing supply. President Alvord replied. Secretary-Treasurer John M. Diven, Charleston, S. C., read his report, indicating that the society is in a flourishing condition, financially and in point of membership, substantial gains having been made during the past year. President Alvord, in his annual address, touched on many phases of the general subject of intimate interest to his audience.

At the afternoon session considerable time was given to receiving various committee reports. The reports from the Committee on Electrolysis, which was presented by Chairman D. H. Maury, consulting engineer, Peoria, Ill., was of much interest, dealing as it did with one of the vexed problems of maintenance of water mains.

Theodore A. Leisen, of Louisville, Ky., chairman of the special Committee on a National Bureau or Department of Health, presented the report of that body. Considerable significance is attached to the work of the committee by reason of the possibility that Congress will create such a bureau. The committee was appointed at the association meeting a year ago to stimulate in so far as practicable such action by Congress. No active effort will be made at the present special session, but it is planned to prosecute the plan with the opening of the regular session.

Two papers were presented at the afternoon session. Thomas McMillan, of Milwaukee, discussed at considerable length "Pumping Station Management." Illustrations were drawn from the experience which Mr. McMillan had gained in his home city.

George Houston, of Kalamazoo, Mich., presented the live topic, "Fire Line Meters, a Comparison of Efficiency." The subject is in a way chronic, coming up as it does periodically for consideration. On one side are arrayed the interests representative of waterworks systems in general, who, with much show of reason, hold that all water should be metered in order to provide a reliable check against abuse.

In as formidable a line-up are the insurance interests, which insist that installation of meters in lines designed to give special fire protection through sprinkling systems and other apparatus in large industrial plants impedes the force of water, reducing the efficiency of the apparatus. The insurance men conclude that reduced protection should find its equivalent in higher insurance rates. That there is much to be said on each side was indicated by Mr. Houston's paper and the discussion that it aroused.

With the close of the afternoon session at 5 o'clock the men of the association were the guests of the Bartholomay Brewing Company for two hours.

At the evening session Leonard Metcalf, of Boston, presented a paper on subject, "Some Fundamental Considerations in the Determination of a Reasonable Return for Public Hydrant Service," which had been prepared collaborated by Mr. Metcalf, Emil Kuickling and W. C. Harvey. The discussion was illustrated with lantern slide charts. D. H. Maury, of Peoria, Ill., gave an illustrated lecture on the Panama canal.

During the progress of the evening session the women of the convention were entertained at cards in one of the hotel parlors.

The session of Wednesday forenoon was taken up with discussion of the previous day's papers, particularly that of Leonard Metcalf, on reasonable returns for public hydrant service. The relations between the city, the water works department and fire insurance companies were discussed by many members in the light of their own experience. General dissatisfaction seemed to exist with the insurance companies for alleged failures to make reductions in rates that were expected in return for water works improvements. However, it was admitted that little was known about insurance affairs and profits, and it was admitted that insurance losses had been very large in recent years. The case of Newark, N. J., was cited, where a high-pressure fire pipe line had been established with a view to reduced rates. When the work was completed insurance rates generally were raised, and those in the newly protected district reduced from the new rate to just what they were before.

The election of officers and selection of the city for the next convention followed. The following officers were elected: Alexander Milne, president; Dow R. Gwinn, first vice-president; Robert J. Thomas, second vice-president; John A. Affleck, third vice-president; John M. Diven, secretary-treasurer. Finance Committee—H. E. Keeler, chairman; Leonard Metcalf and Charles R. Henderson, Executive Committee—Alexander Milne, Dow R. Gwinn, H. E. Keeler, Leonard Metcalf, Robert J. Thomas, John A. Affleck, George G. Earl, Charles R. Henderson, John M. Diven, Theodore Leisner and John W. Alvord.

Louisville, Ky., was chosen for the meeting place for 1912 by a large majority, with Minneapolis second.

The afternoon session was given to the reading of papers, that of J. Chalkley Hatton, Wilmington, Del., on Wood Stave Pipe, answering a number of questions in the question box. The author took a very favorable view of the adaptability of wood stave pipe for water mains in matters of economy in construction, durability and serviceability in the matter of conveying water without serious leakage. He was asked whether the pipe would not rot at high places in the lines and replied that air valves installed at such points would, in his opinion, overcome the difficulty.

In the evening the members were the guests of the Water Works Manufacturers Association who had charge of the exhibit of water works appliances in the corridors of the hotel. Special trolley cars were in waiting near the hotel. On the way a stop was made at the pumping station of the Rochester & Lake Ontario Water Company. The final stop was made at Manitou Beach, where a fish dinner was served. After dinner the party was taken to Ontario Beach Park,

which is the popular resort of Rochester.

Thursday sessions were given to the reading of papers. George G. Earl, New Orleans, explained the system of metering all water services that had been adopted in connection with the inauguration of the new water rates. He explained the basis of rates was arrived at with the end in view of charging all persons alike for water consumed. Charles A. Hague explained the uses of compressed air in water works construction. Papers by Alexander Milne and W. A. McFarland were read by title. A paper by George C. Whipple on hot water problems, which is abstracted at length on another page was presented. C. C. Brown read a paper on the keeping of water works records. Two papers were read which had a bearing on the same general subject, the purification of water. Dr. J. L. Leal explained the theory and practice of the disinfection of water by the use of hypochlorite of lime, and gave instances of its use where typhoid fever epidemics had been stopped. D. D. Jackson presented a paper explaining the physical, chemical, bacteriological and microscopical methods of examining water. Lantern slides were exhibited showing some of the larger organisms existing in water easily removable by mechanical means and bacteria and amoebae visible under the high powers of the microscope. He mentioned those that were and those that were not killed by weak solutions of hypochlorite of lime.

In the evening the city of Rochester provided an entertainment for the members. The largest band in the world gave a concert in the Park Area, and special trolley cars were provided for taking the guests to and from the park.

The Friday forenoon session was given to the reading of papers. In the afternoon, by invitation of the Water Works Manufacturers' Association, the members attended a matinee in Lyceum Theater.

National Association of Comptrollers and Accounting Officers.—The convention was called to order at the Arlington Hotel, June 9, by Alonzo Tweedale, auditor of the District of Columbia, who is president of the association. An address of welcome was made by H. B. F. MacFarland, former Commissioner of the District of Columbia.

The proposition of Herman A. Metz, former controller of the city of New York, to provide a fund of \$10,000 a year, for three years, "to make available to American municipalities the best principles and practice worked out in municipal accounting and reporting," was announced by President Tweedale in his address to the convention. Mr. Metz had written to Mr. Tweedale on the subject.

"Mr. Metz clearly shows in his letter," said Mr. Tweedale, "the great desirability of uniformity in accounting methods throughout the larger cities of the United States, and in a practical way makes possible the accomplishment of that work in which he has been so vitally interested. In my reply I stated to Mr. Metz that in my opinion no other action that had been taken up to that time would be of such great and lasting benefit, and that the result of his endeavor carried to completion would be the saving of millions of dollars annually to the taxpayers in the United States.

"I cannot close without inviting attention to a severe loss suffered by the association during the last year. I refer to the death of our fellow-worker, Frederick W. Carey, city auditor and assessor of Sacramento, Cal., a man whom we all knew and learned to love."

Representative Otto Lobeck, who was elected to the present Congress while controller of the city of Omaha, Neb., and a member of the association, made a brief speech, in which he greeted his former associates, wishing that all of them were in Congress to inculcate principles of proper accounting into the national government's methods. He referred to municipalities as the greatest and most powerful corporations on earth.

The following officers were elected: Edmund D. Fisher, deputy controller of New York City, president; Vice-presidents, S. M. Wilhite, Louisville, Ky.; E. Stetson Griffing, New Rochelle, N. Y.; A. B. Frost, Chelsea, Mass.; A. M. Heston, Atlantic City; J. S. Culpepper, Norfolk, Va.; Dan C. Smith, Jr., Houston, Tex.; J. J. Crowder, Peoria, Ill.; W. H. Farnham, St. Paul, Minn.; L. D. Evarts, Milwaukee, Wis.; A. B. Pfouts, Denver, Col.; E. E. Phelps, Pittsburg; W. H. Deharity, Indianapolis, and Dr. Le Grand Powers of the census bureau; secretary, George M. Rex, Providence, R. I.; treasurer, W. S. McCormick, Duluth, Minn. At the second day's session Buffalo was chosen for the 1912 convention.

Aside from the addresses the feature of the meeting was the adoption of a resolution offered by Milton R. Palmer, deputy controller of Detroit, condemning a policy of some newspapers which give percentage of money to officials furnishing city advertising.

Saturday E. D. Fisher delivered the opening address and he chose as his topic "Standardization" and told how the board of estimate and apportionment of New York City by the appointment of a commission has been able to economize and save the city thousands of dollars.

Dr. Le Grand Powers, chief statistician of the census bureau, made an address at the banquet at the Arlington. He urged state supervision of city accounts, saying that such supervision would tend to make more uniform the systems of accounting in American cities.

The statistician also declared that public accounting is as a rule superior to methods in vogue among private institutions.

Another address that attracted attention was then made by Edmund D. Fisher, deputy controller of New York City, who told of a new system of borrowing for his city. In order not to flood the bond market, New York City will in the future sell most of its bonds in Europe.

Duncan MacInnes, of New York, W. S. McCormick, of Duluth, Minn.; Representative C. O. Lobeck, of Omaha, Neb., a former president of the association, and Alonzo Tweedale, auditor of the District of Columbia, made brief addresses.

In the afternoon President Taft greeted the delegates. The reception took place in the east room of the White House, and before shaking each visitor by the hand Mr. Taft made a brief speech praising the character of the management of public moneys by men in the employ of the federal and state governments. Alonzo Tweedale introduced each delegate to the Presi-

dent and briefly responded to the chief executive's remarks.

The feature of the morning's session of the convention at the Arlington was an extended dissertation by Dr. Frederick A. Cleveland on the "Financial Statements of Municipalities." Dr. Cleveland is chairman of the President's commission on economy and efficiency. The five members of this commission were present to hear the address.

Dr. Cleveland, after pointing out the good and bad points in accounting systems in various cities, made special reference to the balance sheet contained in the last annual report of the controller of Philadelphia. He used the statement as a model, and showed how the government and the public could see at a glance the exact financial condition of the city.

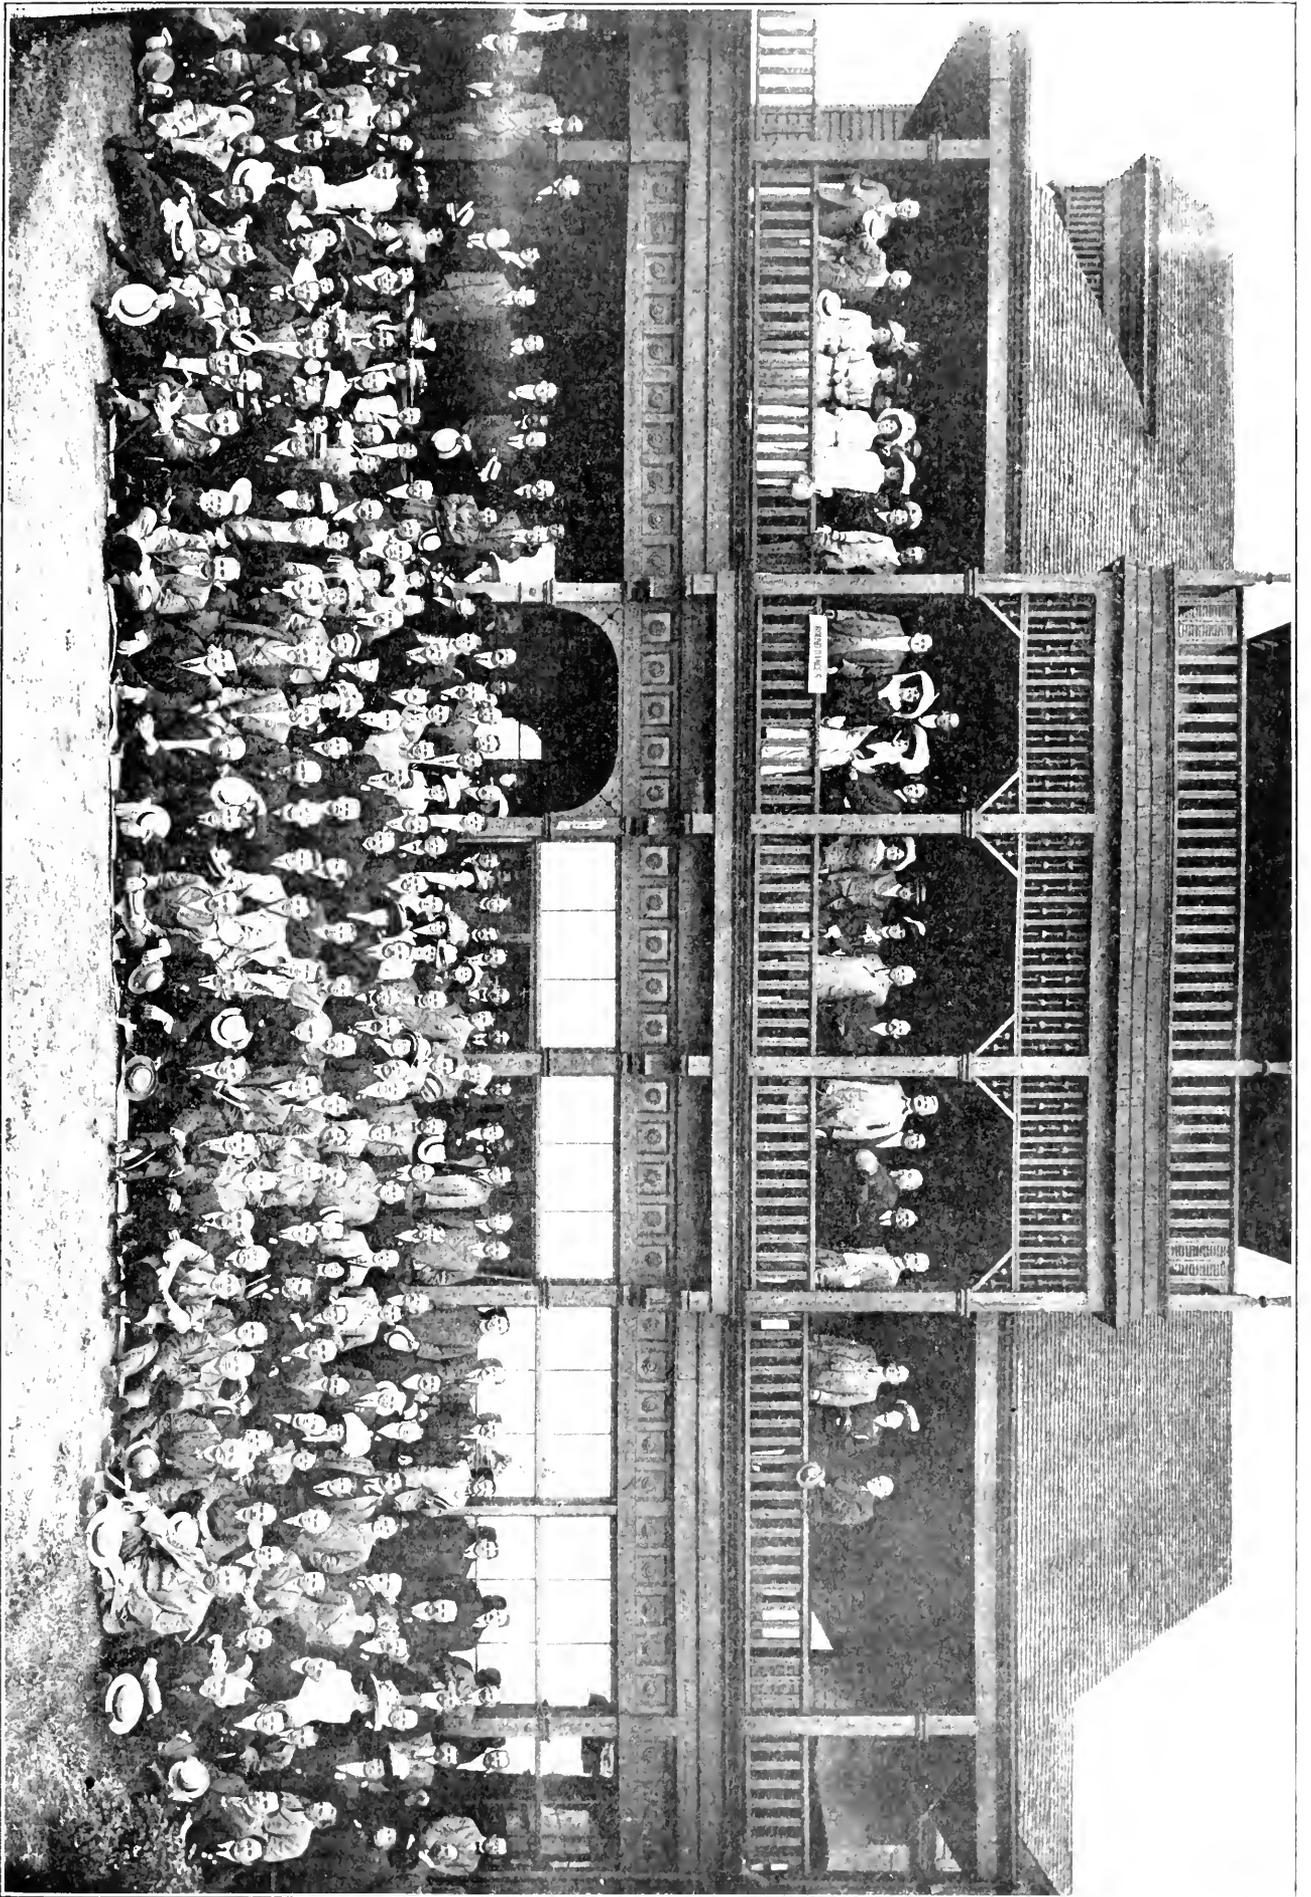

Representative Sweet, of Michigan, was the first speaker in the morning, and he was followed by Howard C. Beck, of Detroit, who took as his topic "The Capital Account of a City." He asserted that the capital account of a city should be the value of all of the property of the city in excess of its liabilities.

Representative Swager Sherley, of Kentucky, won liberal applause when he closed his address at the first day's session by urging a modern system of municipal and governmental budget making which would enable a plain citizen to gain a tangible idea of just what the expenses of the government are in comparison with expenses in other cities.

Dr. Le Grand Powers, chief statistician of the census bureau, was another speaker at the session. He declared that certain cities were issuing bonds without presenting statistics to show that proceeds of former bond issues had been disposed of in a wise manner. As an example he said: "Take the case of a city which issues bonds for a period of fifty years, and with the proceeds lays pavements which last only for eight or ten years. The same city will turn and issue more bonds with which to relay the pavement, and thus piles up debt on debt, with the probability of becoming bankrupt in the future."

Connecticut State Fire Chiefs.—The semi-annual session of the Connecticut Fire Chiefs' Club was held in Bridgeport June 5 with 25 members present. The session was called to order at 11 o'clock in the parlors of the Atlantic Hotel with former Chief A. C. Hendricks, of New Haven, presiding as president. He was given an ovation. Over 80 years old, he still takes an active interest in the work of the organization and gave some interesting reminiscences of the work. He is the first and only president the organization has had. The day marked the first time in several months that he has attended any social or business sessions.

The programme was entirely informal with no special speakers or set arrangements. The discussion was general and comprised remarks on the topic "Fire Prevention of More Importance Than Fire Extinguishment." Bridgeport's fire commissioners were the guests of the organization. Dinner was served at 2 o'clock and afterwards there was an informal inspection of Bridgeport's fire fighting facilities. During the forenoon session there was an alarm from Box 16 and the visitors were given an opportunity to note the Bridgeport apparatus in practical work.

DELEGATES AND GUESTS ATTENDING AMERICAN WATER WORKS ASSOCIATION

Photograph taken at Portland, Oregon, June 7, 1911.

PERSONALS

American Chemical Society.—J. W. Films, superintendent of filtration, Cincinnati water works, read a paper before the Cincinnati section, May 10, on "Sewage Disposal of Cincinnati and Vicinity." He advocated the establishment of a Cincinnati sanitary district, which would include all of the immediate territory on both side of the river, for the purpose of disposing of the sewage on scientific principles.

Louisiana Engineering Society.—J. F. Coleman, New Orleans, presented a paper, May 8, at the monthly meeting of the society on "The Engineer's Problems of Land Reclamation." J. C. Haugh presided.

Albany, N. Y., City Planning Association.—The first act of the new board of governors was to direct the executive committee to prepare an ordinance for introduction in the City Council for the appointment of an expert city planner to be in the employ of the city. The association is composed of representatives of other city organizations.

Union of Canadian Municipalities.—Secretary W. D. Lighthall has announced that the eleventh annual convention will be held in the City Hall, Quebec, by invitation of Mayor Drouin, on August 29-31. The following are among the topics that will be discussed: "Town Planning and Embellishment," "Special Functions of a Provincial Capital," "Conservation of Water and Water Powers," "Country Roads," "Railway Terminals and Crossings," "Street Railway Freight Carriers," "Pure Food in Cities" and "Fire Protection."

Calendar of Meetings

June 11-16.

International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.

June 13-18.

New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.

June 13-16.

American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.

June 21-22.

National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.

June 22-24.

Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.

June 27-July 1.

American Society for Testing Materials.—Fourteenth Annual Meeting, Hotel Traymore, Atlantic City, N. J.—Edgar Mackay, Secretary, University of Pennsylvania, Philadelphia, Pa.

June 28-29.

South Carolina Water Works Association.—Meeting for Organization, Columbia, S. C.—W. F. Steiglitz, Temporary Secretary, Columbia, S. C.

June 28-30.

International Association for the Prevention of Smoke.—Annual Convention, Newark, N. J.—R. C. Harris, Secretary, City Hall, Toronto, Ont.

August 15-18.

Firemen's Association of the State of New York.—Rochester, N. Y.—Thos. Honohan, Secretary, Frankfort, N. Y.

September 12-15.

International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.

September 18-30.

International Municipal Congress and Exposition.—Chicago, Ill.—Curb M. Treah, Secretary, Great Northern Building, Chicago, Ill.

September 18-October 1.

Fourth International Good Roads Congress.—Chicago, Ill.—J. A. Rountree, Secretary, Birmingham, Ala.

BIGELOW, E. M., of Pittsburg, Pa., the new State Highways Commissioner, will supervise the construction of the 7,000 miles of improved roadways provided for in the Sproul bill and will have full charge of the Governor's improved roads plan, which is one of the most comprehensive that any State ever has mapped out. J. W. Hunter, who has been at the head of the road department, probably will become Mr. Bigelow's first assistant.

BIRMINGHAM, EUGENE, has resigned as Superintendent of Police of Bridgeport, Conn.

DOCKWEILER, J. H., water expert of Oakland, Cal., has been engaged by the City Council to render an expert report on the water situation there for rate-fixing purposes. The council has been working on the question of the water rate for the past two months, and confronted by an array of facts and figures submitted by the People's Water Company, has called upon Dockweiler to analyze them for the consideration of the council.

EMMART, WM. M., chairman of the committee on city planning of the City-Wide Congress, of Baltimore, made a plea for a city beautiful as well as a city useful in an address recently before the North Carolina Society.

EPSTEIN, JACOB, is the first to accept the invitation Mayor Preston of Baltimore extended to a number of prominent business men, asking them to serve as members of his advisory commission.

FARLEY PHILIP P., President of the Jamaica Bay Improvement Commission, has been appointed Deputy Fire Commissioner of New York City. Mr. Farley was the Democratic candidate for State Engineer and Surveyor in 1908.

FORREST, C. M., an asphalt expert from Albany, spent several days in Binghamton, N. Y., recently, inspecting the various roads treated with asphaltic oil during the past two years. Mr. Forrest on his return to Albany made reports and recommendations to the State Highway Commission as the result of his inspections.

FUERTE, JAMES H., sailed from New York on May 31 for Para, Brazil, where he will make a report on the sewerage of that city. He will return to New York about the middle of July. A few years ago Mr. Fuertes was a member of the commission of engineers, including his father, the late Estevan A. Fuertes, and Dr. Rudolph Hering, which prepared plans and made a report on the sanitation of the city and port of Santos, Brazil.

GOODWIN, DR. EDWIN, the new Health Officer of Bay City, Mich., after a month of preparation, including a two weeks' post-graduate course "brushing up" on bacteriology and microscopic work at Ann Arbor at his own expense, has started in a sanitary inspection of Bay City such as the town has never before enjoyed. He expects to be busy a couple of months as he will review the sanitary conditions surrounding all meat markets, dairies and milk depots, restaurants, grocery stores, ice cream plants, slaughter houses, bakeries, candy stores and a number of places where other articles of food are made. His procedure will be novel in that he has secured the free services of several men who are experts in their various lines of business.

HAMILTON, JOSEPH W., has been appointed City Engineer of Pasco, Wash. He enters the service of the city from the United States Reclamation Service, where he has been engaged on the Sunnyside project. He is a graduate of the University of Virginia and was formerly City Engineer of St. Paul, Va.

HARPER, E. F., has been appointed City Engineer of East St. Louis, Ill. Mr. E. W. Rodenberg has been appointed Assistant Engineer in charge of outlet sewer, and Mr. James F. Parr, Assistant Engineer, in charge of streets.

HAIGHT, LESLIE, has been appointed Superintendent of Fire Alarm at Binghamton, N. Y.

HERBERT, H. W., has been chosen by the Water Commission of Camden, N. J., as chief of the Water Department to fill the unexpired term of Robert Hollingsworth, deceased.

HOWARD, DR. HARRISON W., is the new Mayor of Wilmington, Dela.

HIRZEL, ALFRED J., has been appointed City Engineer of Wilmington, Del.

HUNT, A. M., has been appointed consulting engineer for the construction of the Geary Street municipal railway, of San Francisco, by the Board of Public Works. He has been engaged for a number of years past in hydro-electric power development and with public service companies in the west coast cities. He was connected with the work of conversion of the Los Angeles railways from cable to electric power.

HALL, ROBERT, who for the past ten years has held the position of manager of the Corpus Christi water supply department, has resigned the position to assume charge of the interests of F. Z. Bishop at the new city of Bishop, Texas.

JONES, WILLIS S., has been appointed City Engineer of Pomona, Cal.

MANN, G. W., remains as City Engineer of Reno, Nev., under the new administration.

MARTIN KINGSLEY, of New York, handed his resignation as Bridge Commissioner to Mayor Gaynor. He gives up the position to accept one as head of the Foundation Company, a concern whose specialty is the constructing of foundations for buildings.

MIXON, C. M., has been elected mayor of Amite City, La.

MOORER, H. B., is the new mayor of Henning, Tenn.

MOTT, FRANK K., was re-elected mayor of Oakland, Cal.

O'MEARA, STEPHEN, has been appointed Police Commissioner of Boston, Mass.

PEYTON, E. A., was reappointed Superintendent of Water and Sewers by Mayor Burton of Chickasha, Okla. Mr. Peyton has been in charge of the plant for the past six years.

RUSHLIGHT, A. G., has been elected Mayor of Portland, Ore.

SAMUEL, GEORGE F., has been appointed Engineer of Track Elevation for the city of Chicago. He has been engaged in municipal work since his graduation from the University of Michigan in 1885, and first became connected with the city of Chicago in 1888, as Assistant Engineer in the Bureau of Streets. Since then he has been in charge of construction of the water works tunnels and in charge of pumping stations. In 1910 he became Assistant City Engineer.

SHIRLEY, MAJ. JOSEPH W., Chief Engineer of the Topographical Survey, has been appointed by the Mayor as the city's representative on all work being done by the State Roads Commission within the city limits. Upon Major Shirley will devolve the responsibility for any delays which any of the municipal departments might occasion with the good roads work.

SLOAN, JOSEPH E., has been appointed Fire Chief of Newark, N. J.

VAN AMBURGH, CHARLES, has been reappointed Superintendent of Highways of Broome County, N. Y., with headquarters at Binghamton.

WEBB, DR. DE WITT, is the new Mayor of St. Augustine, Fla.

INDUSTRIAL NEWS

Cast Iron Pipe.—Chicago: The leading pipe interest is busy filling orders placed in the spring. Although prices are firm, an advance is not expected. Quotations: 4-inch, \$25.50; 6 to 12 inch, 24.50; 16-inch and up, \$24. Birmingham: The rate of production continues below normal and in no case has stock accumulated to any appreciable extent. Quotations are considered nominal as follows: 4 to 6 inch, \$22.50; 8 to 12 inch, 22; over 12 inch, average, \$21. New York: The general market continues very quiet. Quotations: 6-inch, cast pipe, \$21 to \$22.

Lead.—Prices are somewhat firmer, but demand is light. Quotations: New York, 4.375c.; St. Louis, \$4.225c.

New Life Net.—A test of a new life net was recently made in Schenectady, N. Y., by Fire Chief Henry R. Yates, Commissioner of Public Safety James J. McDonald, Captain Sanford Alberts, designer and maker of the net, and William Hansen, chief rigger at the works of the General Electric Company. Bags of sand weighing 130 pounds, thrown from second and third story windows, were caught without injury to the net. The net will be used by one of the local companies. It is stated that the nets can be made for \$17.

Test of Paving Brick.—The Henry S. Pachman Engineering Co., Philadelphia, Pa., have reported on a series of tests made for the Augusta Vitriified Block Company of paving brick made at their Harlem, Ga., plant. The losses by abrasion of different lots tested were as follows: 22.06; 22 and 20.2.

Gives Asphalt for Highway.—The Pittsburg-Salt Lake Oil Co., Salt Lake, Utah, has sent a communication to the Commercial Club offering to give sufficient crude asphalt from its Sunnyside deposits to surface a road 40 miles long from Salt Lake through Davis County. The estimated quantity needed is 60,000 tons.

Trinidad Asphalt Oil.—The tanker *Predentia*, loaded with 3,800 tons of crude oil for Perth Amboy, N. J., is the first shipment of oil from Trinidad. Her boats are to be used, and shipments every ten days are expected. Oil can be discharged into steamer tanks at the rate of 2,400 barrels per hour through 10-inch mains extending from the land tanks and reservoirs along the 1,700-foot pier. The oil refinery at La Brea is now in operation. Many tanks have been constructed to care for the products. The works have a daily capacity of treating 3,000 to 3,500 barrels of crude oil.

Show Engine.—The auto fire engine contracted for from the American-Lorraine Fire Engine Co., Elmira, N. Y., by the city of Waterbury, Conn., will be exhibited at the convention of International Association of Fire Engineers, Milwaukee, Wis., September 19-22. The engine is the first of this special kind to be built by the company.

Concrete Paving.—R. S. Blome and Co., Chicago, Ill., has notified the city of Spokane, Wash., that it will be held responsible for payment of a royalty to the company for the paving of Division Street between Sprague and Fourth Avenue. The sum of \$3,150.20 is demanded, which amounts to 35 cents per square yard on 8,872 square yards of pavement. The street has just been paved with concrete by John Fife.

Carbolineum.—C. S. McKinney Company, 50 Church Street, New York City, who are the owners and sole selling agents of three carbolineum wood-preserving companies, issue a pamphlet explaining that all carbolineum is not alike. Their highest grade is called Cop'R-oil, another grade Bincre, and ordinary cheaper grades have no special names. It should not be assumed that the low grades are unsuitable for some purposes. The Cop'R-oil carbolineum is a heavy oil of coal tar having a high boiling point with powerful antiseptic chemicals added. The following description and definition of carbolineum appeared in McGraw's Electrical Dictionary for Buyers (1909):

CARBOLINEUM. This name covers a multitude of different compounds made in different ways by different manufacturers. The better class of manufacturers and chemists seek to confine the name to compounds containing the products of the destructive distillation of coal tar, which distill over at the higher temperatures, and are known as "heavy oils" in contradistinction to "light oils or creosote oils." These heavy oils, freed from substances which are solid at low temperatures, such as naphthalene, are powerful and persistent antiseptics in themselves alone, but they are improved by the addition of other antiseptics, such as zinc chloride and the copper salts. It is easy to doctor up low grade oils until they look and smell right, though valueless as wood preservatives, hence Carbolineum should be subjected to rigid chemical tests, or purchased from reliable dealers, who are competent to select and test the products which they sell. There is no proprietorship in either the name "Carbolineum" or the method of manufacturing it, and all brands of Carbolineum are "genuine," though some may be worthless. Carbolineum is the name given to a modification of Bethel's process of preserving wood, patented in England in 1838 and introduced into Germany by Bröner in 1816, and it has been extensively used since that time in all parts of the world, as an efficient and a comparatively cheap wood preservative, convenient to apply at the place of use by unskilled labor.

Fire Extinguishing Compound.—In the presence of Deputy Fire Chief Thomas Lally, New York Fire Department, and several experts who are making a study of scientific fire fighting, officials of the Standard Oil Company fought a blaze with chemicals and within a minute subdued flaming oil, such as has, on many occasions, caused much damage in the large plant in Kent avenue, Williamsburg. Four times men set fire to oil and gasoline, which for the purposes of experiment had been placed in a small isolated tank, and each of these promising fires was extinguished quickly by the introduction into the tank of aluminum sulphate, bicarbonate of soda and licorice.

The new system comprises, in addition to the necessary fire pump, two tanks of a combined capacity of 38,000 pounds of chemicals. There is a small quantity of water in the tanks for the purpose of dissolving the chemicals. One of the tanks is used for a solution of aluminum sulphate and licorice in the proportion of 18,000 pounds of aluminum to 8,000 pounds of licorice. In the other tank there are 12,000 pounds of bicarbonate of soda.

The two solutions are mingled as they are forced through the pipes and as they reach the tank in which the fire has started they swell into a yeast like froth, spread across the surface of the burning liquid, separate the liquid from the air and put out the fire.

Modern Municipal Illumination.—With this caption the Flour City Ornamental Iron Works, Minneapolis, Minn., has issued its new de luxe edition of its Lamp Standard Department. The shape of the brochure, long and narrow, is suited to the proper display of the different styles of standards of classical designs made by the company. A list of a few cities having large installations of Corinthian standards is given; they are Atlanta, Ga.; Duluth, Minn.; Minneapolis, Minn.; Jacksonville, Fla.; Fort Dodge, Ia.; Milwaukee, Wis.; Oklahoma City, Okla.; Winnipeg, Canada. As indicating the high character finish which has been done by the Flour City Company, it may be mentioned that all of the ornamental standards on Federal buildings throughout the country are of their manufacture.

One of their devices used in connection with police call systems is worth mentioning, because the lights commonly used for calling officers are far from ornamental. On certain standards, in the place of the iron bulb or acorn forming part of the ornamentation of each bracket, a colored globe is substituted. This is not out of harmony with the design and answers the purpose perfectly.

The brochure illustrates two Corinthian, two Capital and two Egyptian designs. Indicating the substantial character of the construction is a photograph of the Nicollet Avenue fire of last winter, when the standards were uninjured, although the buildings on the opposite side of the street were damaged.

Imhoff Royalty.—In the course of a discussion regarding the relative merits of an Imhoff system of sewage disposal and a trunk sewer for the city of Passaic, N. J., the fact was brought out that the royalty charged by the Imhoff company would be \$400 for each 10,000 of population served.

Contracting Firms Merged.—The McCartin Contracting Company and the Southern Asphalt and Contracting Company, both of Birmingham, Ala., have combined their capital and interests and the name of the latter will be retained. The capital of the new company will be \$50,000. Officers have been elected as follows: Eugene Fies, president; J. R. Copeland, vice-president; John McCartin, vice-president; John Donaldson, vice-president, and John Crawford, secretary. The new organization starts out with \$200,000 work on hand. It is the intention of the company to bid on work in all the Southern cities.

Garbage Plant.—Citizens of Bridgeport complain that the odors from the new garbage plant are very similar to those from the old one. Commissioner Whitcomb, who has visited the plant, says that there is no accumulation of garbage in the pit to speak of, and he thinks the odors are created by gases generated during the process of reduction.

Mechanical Filtration Plant.—The mechanical filtration plant at Cohoes, N. Y., built by the New York Continental Jewel Filtration Company, has been finished and placed in operation. It will be operated several months before it is finally accepted by the city.

Portable Pumping Plants.—Commissioner Edwards of the New York Street Cleaning Department is looking up the subject of portable gasoline pumping plants to be used for pumping river water into street flushing machines. A pumping capacity of about 300 gallons a minute is desired. The scarcity of Croton water, as well as the question of economy, is the cause of the innovation.

Inspecting Asphalt Pavements.—Francis P. Smith, of Dow and Smith, chemical engineers, recently looked over 30 miles of Syracuse pavement in company with Mayor Schoeneck, Commissioner of Public Works F. M. Westcott, Deputy City Engineer Isaac Schwartz and Superintendent G. H. Beebe of the Bureau of Water. They also visited the asphalt mixing plant of the Warner-Quinlan Company in Fulton Street. Mr. Smith returned to New York well supplied with samples of pavement for analysis and report.

Information Bureau.—The Salvador government now maintains an information bureau to report upon the orders which the various departments of the government may consider placing abroad or in the home market. Manufacturers interested should send catalogues and prices addressed to the Oficina de Informacion, Ministerio de Agricultura, San Salvador.

Auto Engine.—A Webb auto fire engine has recently been installed in the Vailsburg section of Newark, N. J. Under Acting Chief Sloan a test was made. The apparatus was sent six-tenths of a mile and the men laid six lengths of hose in two minutes and fifty-four seconds after the call was sounded.

Auto Combination Apparatus Tested.—An auto combination hose and chemical wagon built for the Sanford, N. Y., fire department by the American La France Company was recently tested. The auto is 48 horsepower, with eight cylinders, though 72 horsepower is developed under speed. Hills were climbed at speeds varying from 20 to 46 miles an hour. Mayor Ellison, Fire Commissioners Amey and Cole, Fire Chief McCarthy, several of the city's Aldermen and others to the number of 11, rode on the truck during the demonstration.

Municipal Lighting Plants.—When the Chamber of Commerce of Manette, Ga., recently made an investigation of municipal ownership of lighting and water plants, it found that of the 89 municipally owned lighting plants in Georgia, 51 had been built by J. B. McCrary Company, Atlanta, Ga.; of the 107 municipally owned water works, 33 were built by the same company. Joseph M. McCrary, president of the company, is an engineer. Altogether 300 municipal plants have been built by this company. The company has a bond department which assists the towns in disposing of their securities.

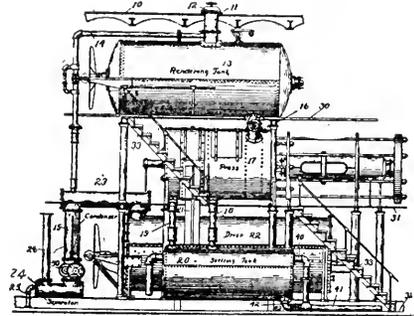

Trinidad Maltha.—Dr. Albert Sommer, recently connected with the Texas Company, will take charge of a new department of the Barber Asphalt Paving Company. Dr. Sommer received the degree of Doctor Ingenieur, Dresden University, in 1903. Later he was assistant in the chemical laboratory of Prof. Walter Hempel, Dresden University, whose specialty is technical organic chemistry. In 1910 Dr. Sommer was lecturer on Petroleum and Its Products, School of Marine Engineering, United States Naval Academy, Annapolis.

Dr. Sommer is already actively engaged in the enormous amount of development work undertaken immediately upon the discovery of the Trinidad maltha in the neighborhood of the asphalt lake. He describes this discovery as the "mother substance" of Trinidad asphalt and one that, having no exact counterpart among the malthas heretofore known to the asphalt industry, is destined to play an important part in the future progress of street paving and road building.

PATENT CLAIMS

994,047. **SYSTEM OF APPARATUS FOR TREATING GARBAGE.** Frederick G. Wiselogel, Indianapolis, Ind., assignor to United States Construction and Utilization Company, Rochester, N. Y., a Corporation of New York. Serial No. 451,106.

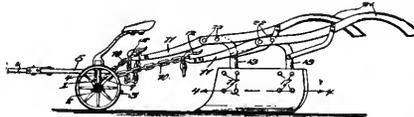

In a refuse reduction plant, the combination of a receiving floor, a pair of rendering tanks arranged beneath said floor and having receiving portions in said floor, a press arranged beneath the rendering tanks, independent connections between each rendering tank and press, a drier arranged beneath the press, a connection between the pulp discharge of said press and the drier, a settling tank also arranged beneath the press, a connection between the

liquid discharge of the press and the settling tank, a valved draining discharge leading from said settling tank at its lowest point, an overflow passage leading from an upper portion of the settling tank, a condenser, a connection between said condenser and the rendering tanks and drier, a vacuum pump connected with said condenser so as to maintain a vacuum within the drier and rendering tanks, and a separator connected with the discharge side of said pump, and having a liquid discharge pipe and a gas discharge pipe, all combined and arranged as set forth.

993,487. **ROAD-SCRAPER.** Jacob Williamson, Ava, Ill. Serial No. 590,938.

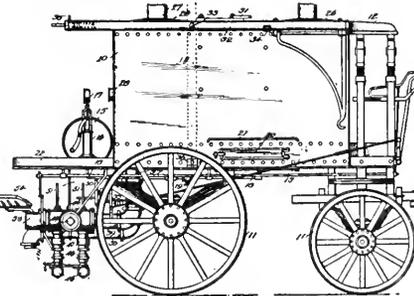

In a road grading machine, a pair of scraper beams capable of being changed in position, one in advance of the other, and provided with downwardly extending cylindrical portions at their rear, a scraper con-

ected between the beams and provided with tubular members in which the downwardly extending portions of the beams are swiveled, in order to permit a swiveled action between the beams and the scraper when the beams are changed in position relative to one another.

993,618. **APPARATUS FOR TREATING ROADS.** Henry K. Potter, Boston, Mass., assignor to Studebaker Brothers Manufacturing Company, South Bend, Ind., a Corporation. Serial No. 588,337.

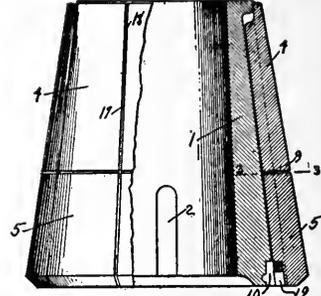

The combination with a vehicle running gear, of a tank mounted thereon, a fire box under the tank, T-rails on the running

gear, said rails having their webs upstanding, and the side walls of the tank being extended to form the side walls of the fire box, and secured to said upstanding webs on the outside thereof, the bottom of the fire box being secured to the inner horizontal flanges of the T-rails, and a spraying device connected to the tank.

993,783. **CRUSHER-HEAD.** Volney W. Mason, Jr., New York, N. Y., assignor to Edgar Allen American Manganese Steel Company, Augusta, Me., a Corporation of Maine. Serial No. 588,157.

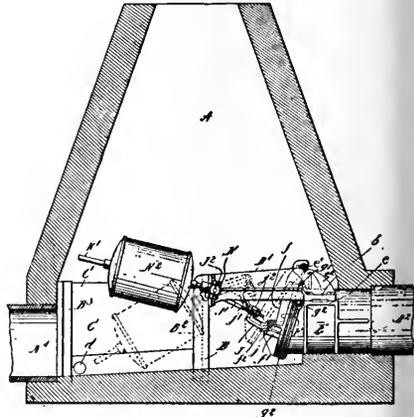

In a crusher head, a core having a series of vertically extending grooves; a series of circumferentially arranged segments spaced apart from one another and occupying the upper portion of the exterior surface of said core, and having each a rib adapted to enter one of the grooves aforesaid and to co-operate therewith to

hold the segments in place upon the core; a second series of circumferentially arranged segments spaced apart from one another and occupying the lower portion of the exterior surface of said core, and having each a rib similar to the ribs of said first mentioned segments; and means interposed between adjacent ends of aligned segments of said two series of segments whereby they are spaced apart from one another.

993,587. **REGULATOR - VALVE FOR SEWERS.** Charles H. Dodd and Richard J. McNulty, Boston, Mass. Serial No. 521,665.

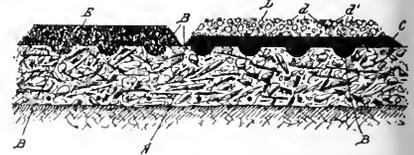

The regulator valve above described, comprising a nozzle, a gate, and means for supporting said gate comprising two arms mounted on said nozzle, each arm being slotted, a hinge rod adjustably mounted

in said slots to form a hinge for said gate whereby said gate may be adjusted on an axis transverse to the length of said nozzle, as well as toward and from said nozzle in combination with means for operating said gate.

994,092. **CONCRETE ROADWAY.** Edward M. Chadbourne, San Francisco, Cal. Serial No. 615,134.

The method of pavement construction which consists in providing an aggregate composed of a mixture of wear resistant stone of such size as to have a large percentage of voids and sand or equivalent having a smaller percentage of voids, the interstices in the sand being of such size as to exert capillary attraction on a limpid

but normally non-fluid asphaltic binder, then heating the mixture of stone and sand and filling the interstices therein from the bottom capillary action, with a normally non-fluid asphaltic binder rendered limpid by the heat of the mixture of stone and sand, whereby a homogeneous layer is produced having no excess of either binder or aggregate.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

Table with columns: STATE, CITY, RECEIVED UNTIL, NATURE OF WORK, ADDRESS INQUIRIES TO. Includes sub-sections for STREET IMPROVEMENTS and SEWERAGE.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
SEWERAGE (Continued)				
Minnesota	Morris	June 27, 8 p.m.	Constr. 3,232 ft. of 8-in. sewer, 4-in. tile drain, manholes, flush tank, etc.	C. B. Burpee, City Clerk.
New York	Hempstead	June 27, noon	Bldg. about 122,930 lin. ft. 8 to 20 in. vit. pipe, about 2,000 lin. ft. 8 to 18-in. cast iron pipe, about 115,300 cu. yds. excavation, 3,000 vert. ft. concrete manholes, 113 flush tanks, 445 man-hole covers, 18,000 lin. ft. 6-in. vit. pipe for house service, two pumping plants and one disposal plant.	M. O. Hedges, Clk. Vil. Bd.
Maryland	Baltimore	June 28	Constr. storm water sewers in the bed of Jones' Falls, preliminary to constructing boulevard over Falls.	J. H. Preston, Mayor.
New York	Hudson	June 29, 6 p.m.	Constr. 10-in. vit. tile sewer on Green street.	M. J. O'Hara, City Engineer.
California	San Jose	July 3	Construct septic tank for County hospital.	City Clerk.
South Dakota	Madison	July 6, 8 p.m.	Bldg. sewer system about 31,465 lin. ft. 6 to 18 in. vit. pipe.	George H. Waskey, Mayor.
WATER SUPPLY				
Colorado	Colorado Spgs.	June 16, 10 a.m.	Furn. and laying 63,785 ft. of cast iron pipe 4 to 16-in., and 43 tons special castings; alternate bids for 12 and 16-in. steel pipe; 143 gate valves and boxes; 53 tons pig lead, manh., etc.	H. F. Ivory, Mayor.
Indiana	Evansville	June 17, 10 a.m.	Furnishing about 250 tons of c. i. pipe and spec. valves, meters.	Henry L. Heilman, Secy. Bd. W. C.
Kansas	Cherryvale	June 19, noon	Bldg. water purification plant, storage reservoir, etc.	E. E. Bellamy, City Clerk.
Ontario, Can.	Toronto	June 20, noon	Laying about 3,500 ft. of riveted steel pipe 6-in. in diameter in Lake Ontario.	F. S. Spence, Chm. Bd. Control.
Alabama	Gadsden	June 21	Furn. about 900 tons of water main, 20 tons of specials, 20 tons of lead, 30 valves and 26 hydrants.	M. E. Jones, Supt.
New York	New York	June 21, 2 p.m.	Furnishing and driving test wells in Kings, Queens and Nassau counties; hauling and setting fire hydrants, etc.	H. S. Thompson, Comr. Water. Sup.
Vermont	Ft. Ethan Allen	June 21, 10 a.m.	Building addition to pump house, installing electrically driven pumping machinery; building concrete reservoir; remodeling electric lighting system.	R. J. Fleming, Capt. 10th Cav. Qm.
Indiana	Hammond	June 21, 10 a.m.	Furnishing 6,400 feet 36-in. standard c. i. water pipe and 4,950 feet 16-in. c. i. water pipe.	A. R. Ebert, Chm. Bd. Pub. Wks.
New Jersey	Crosswicks	June 22	Constr. a system of water works.	Geo. B. Thorn, Secy. Cross. Wt. Co.
Texas	Galveston	June 22, noon	Furn. compound Corliss fly-wheel pump of 4,000,000 gals per day capacity, including piping, valves, foundations, etc.	W. D. Masterson, City Supt. of Elec.
Arkansas	Mena	June 23	Constr. new distribution system for water works Dist. No. 2; separate bids for material and construction; 780 tons c. i. pipe and special castings; about 40,000 ft. of 4 to 12-in. mains.	John Thompson, Chm. Bd. Imp.
Ohio	Euclid	June 26, noon	Laying 6-in. water mains in four avenues.	F. H. Schoaff, Village Clerk.
New Jersey	Bridgeton	June 27	Constructing complete pumping station and water filtration works, machinery, pumps, fillers, etc.	J. J. Jones, City Clerk.
Kentucky	Frankfort	June 27, 11 a.m.	Constr. pipe line to Lakeland, consisting of 7,360 ft. 16-in. pipe, 21,680 ft. 12-in. pipe, 10,690 ft. 8-in. pipe.	Albert Scott, Pres. Ken. St. Bd. Cor.
Quebec, Can.	Montreal	June 29, noon	Installing pumping machinery, blower and cranes at filtration plant.	L. N. Senecal, Secy. Bd. Comrs.
Minnesota	Minneapolis	June 30	Furnishing filter equipment and devices.	Henry N. Knott, City Clerk.
Ontario, Can.	Ft. William	July 1	Selling equipment of municipal pumping and electrical generating plant, suitable for town of 5,000 inhabitants.	John Wilson, City Engineer.
Ohio	Cleveland Hghts.	July 5, noon	Building 10-in. water main in Cedar Roads.	H. H. Canfield, City Clerk.
BRIDGES				
Washington	Ritzville	June 16	Constr. a 2-span steel bridge across Palouse River.	County Commissioners.
Ohio	Cincinnati	June 16, noon	Building bridge on Dunlap Creek road, Colerain township.	Fred Dreihls, Clk. Co. Comrs.
Pennsylvania	Sunbury	June 16, noon	Building bridge, Spurnheim street, Shamokin.	E. W. Young, Ch. Clk. Co. Comrs.
Maine	Mars Hill	June 17	Bldg. rein. conc. bridge, 66 ft. span, 24 ft. roadway.	W. M. Denman, Spring., Mass., C. E.
Indiana	South Bend	June 19, 11 a.m.	Taking down old bridge and re-erecting an iron truss bridge in Penn township.	John W. Harbou, County Auditor.
Ohio	Lima	June 20	Constructing a concrete arch bridge.	Bd. County Comrs.
Pennsylvania	Kutztown	June 20, 10 a.m.	Constr. a reinforced concrete arch bridge.	A. L. Rhoades, County Comptroller.
Iowa	Eldora	June 22	Constr. a 7-span steel bridge 30 ft. wide with concrete floor over Iowa River, at Iowa Falls.	E. L. Marriage, County Auditor.
Ohio	Brooksville	June 22, 10 a.m.	Building superstructure bridge No. 239, Clay township.	Board Co. Comrs.
Ohio	Dayton	June 22, 10 a.m.	Constr. superstructure on Bridge No. 239 over Wolf Creek in Clay township, including removal and purchase of old structure.	J. O. Donovan, Clk. Bd. Co. Comrs.
Ohio	Cincinnati	June 23, noon	Constr. bridges, culverts and approaches on County Club road in Sycamore, Silverton and Columbia townships.	Stanley Struble, Pres. Bd. Co. Comr.
Virginia	Rocky Mount	June 24	Constr. two bridges in Franklin County, of iron.	J. H. Ferguson, Chm. Bridge Com.
Washington	Tacoma	June 26, noon	Constr. new bridges on 11th st. Separate bids on (1) substructure; (2) entire bridge except steel work, electrical and other machinery; (3) Furn. metal work, electrical equipment; (4) Erecting superstructure; (5) Constr. bridge complete, removing old bridges constr. temporary bridge.	City Clerk.
Texas	Houston	July 1	Constr. a reinforced concrete viaduct over Houston ship channel about 1,650 ft. long and 60 ft. wide.	F. L. Dormant, City Engr.
Pennsylvania	Pittsburg	July 1	Constructing one concrete arch, estimated cost \$85,000.	City Clerk.
Ohio	Cincinnati	July 7, noon	Constr. concrete bridge at intersection of German and Compton roads in Springfield township.	Stanley Struble, Pres. Bd. Co. Comr.
LIGHTING AND POWER				
Sask., Can.	Prince Albert	June 26	Furn. hydraulic power and electrical power equipment.	C. O. Davidson, Secy.-Treas.
Arkansas	England	July 1	Building and operating an electric light plant under a 30-year franchise.	H. Galloway, Recorder.
Australia	Brisbane	Jan. 30, noon	Designs, supply and erection at Mount Crosby Pumping Station of alternatively one, two and three complete units consisting of power generating pumps and plants, etc.	Geo. Johnston, Albert St., S.&W.B.
FIRE EQUIPMENT				
Dist. of Col.	Washington	June 20, 2 p.m.	Furn. 15,000 ft. 2½-in. cotton covered rub. lined fire hose.	Cuno H. Rudolph, Commissioner.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Updike, Chm. F. & W. Com.
MISCELLANEOUS				
Arkansas	Benton	June 16	Erecting jail; separate bids for cell work.	W. H. Evans, County Comr.
Manitoba, Can.	Winnipeg	June 16	Erecting an incinerator.	M. Peterson, Secy. Bd. Control.
Indiana	Evansville	June 19, 7 p.m.	Constr. earth work embankments surrounding filtration plant consisting of about 2,500 cu. yds.	Henry L. Heilman, Secy. Bd. W. C.
New Jersey	Perth Amboy	June 19, 8:30 p.m.	Building fire house for Liberty Ladder Company.	Wilbur LaRoe, City Clerk.
Ohio	Toledo	June 23, 2 p.m.	Constructing a market house.	J. R. Cowell, Director Public Servi.
Georgia	Macon	June 20	Constr. a new jail.	County Commissioners.
New York	N. Brighton, S.I.	June 20	Constr. building, destructor foundations, chimney base, connecting flues, dust pockets, ventilating ducts and adjuncts for the Clifton Refuse Destructor.	Geo. Cromwell, Boro. President.
California	Oakland	June 21, 11 a.m.	Collecting and disposing of garbage and refuse.	James W. Nelson, Secy. Bd. P. Wk.
Indiana	Indianapolis	June 21	Collecting and disposing of garbage.	Edw. A. Ramsay, City Clerk.
Massachusetts	Holyoke	June 23, 2 p.m.	Constructing shelter for public playground.	Oscar C. Perry, Assistant Clerk.
Indiana	South Bend	June 26, 10 a.m.	Furn. 50 or more voting machines.	John W. Harbou, Auditor.
Ohio	Maumee	June 26, noon	Erecting a village hall building.	Geo. V. Raab, Village Clerk.
New Jersey	Paterson	June 28	Collecting and disposing of garbage and refuse for term of 5 years from July 1.	T. S. Standeven, City Clerk.
Ontario, Can.	Ft. William	June 30, 5 p.m.	Constructing a reinforced concrete subway.	John Wilson, City Engineer.
Indiana	Muncie	July 5	Constructing a new barn at County Infirmary, 40x50 ft.	County Auditor.

STREET IMPROVEMENTS

Andalusia, Ala.—Board of Revenue has asked for bids for construction of additional 10 miles of good road.

Richmond, Cal.—Bissell ave., 1 1/4 miles, will be paved with asphalt; cost about \$50,000; plans by City Engineer Chapman.

Willows, Cal.—Glenn County is considering \$200,000 bond issue for roads and ridges.

Bridgeport, Conn.—Mayor Buckingham has recommended extension of Broad st. and wider approach to Stratford ave. ridge.

Jacksonville, Fla.—Estimates will be prepared of cost of paving Ionia and Clay sts. with vit. brick.

Dalton, Ga.—Catoosa County has decided to build road to connect with government line at Ringgold.

Indianapolis, Ind.—Board of Public Works has adopted resolutions for improving eight streets.

Jacksonville, Ind.—Board Public Works has decided to pave Meridian st.

Portland, Ind.—Jay County Commissioners have rejected all three bids submitted for construction of proposed O. S. Buckingham stone road in Bearcreek township.

Princeton, Ind.—Gibson County Commissioners will soon let contract for constructing 3 gravel roads in Wabash Township at cost of \$21,000.

Louisville, Ky.—Three miles of modern metal built and drained road will be constructed on Bardstown road through village of Fern Creek by the Fiscal Court of Jefferson County.

Plaquemine, La.—Police Jury is considering building of gravel road on Bayou, laquemine to Indian Village; distance, 9 mi.

Chicopee, Mass.—City will expend \$25,000 on permanent street improvement work.

Detroit, Mich.—Council has passed resolutions providing for the resurfacing of arned, Madison, 24th and Beaubien sts., lark and Warren aves.; cost about \$11,970.

Houghton, Mich.—Village Council has authorized expenditure of \$1,500 to macadamize West Sheldon st.

St. Paul, Minn.—Re-paving of 5th st. is being considered; either creosoted wood blocks, cost \$20,564.70, or sandstone, \$22,26.70, will be used.

Jackson, Miss.—Council has decided to spend \$85,000 on street improvements.

Butte, Mont.—Improvement of West Park st. is being urged.

St. Louis, Mo.—Bids will soon be asked by Commissioner of East Fourth St. District for paving East Fourth st. with creosote block or asphalt.—Claude Ringo, secretary.

Hastings, Neb.—Extension of First st. paving is being considered by Council.

Bayonne, N. J.—Council has passed resolution for asphaltting of Ave. C.; is also considering improvement of five streets.

Millville, N. J.—Council has decided to pave High st. with small gravel stones.

Rahway, N. J.—Council has decided to pave Main st. with asphalt paving brick or corks.—Chas. H. Lambert, City Clerk.

Trenton, N. J.—Bids will be asked for pairing North Broad st. with Filberne; Council has decided to pave Highland ave. with high grade asphalt and is considering paving of Ward Alley with onolith concrete.

Albany, N. Y.—Council has passed ordinance for repaving Livingston ave. and lack road and improving of Buchanan

East Syracuse, N. Y.—Village Board, rough Superintendent I. W. Allen, is planning to resurface or fill practically every street in this village during season; acadam will laid on two blocks in Center st., one block in Upton st. and two corks in McCool ave.

Mount Vernon, N. Y.—City has issued 8,000 bonds for street improvements.

Niagara Falls, N. Y.—City Engineer F. S. Arkhurst has been instructed by Board of Public Works to estimate cost of paving th st. from Niagara st. to Ferry ave., and th st. from Ontario ave. to Portage road, and permanent sidewalks in 13th st. from Niagara st. to Ferry ave.

Oswego, N. Y.—Superintendent of Highways E. A. Howard has received notice from State Highway Commission that plans have been drawn for the improvement of Fruit Valley Southwest Oswego road, and that bids will soon be asked; road will be built this summer.

Rochester, N. Y.—Bids have been rejected and new proposals will be asked for paving Mt. Hope ave. cement walks.

Walden, N. Y.—Bids received for constructing 1 1/2 miles of concrete sidewalk have been rejected; work will be done by village; estimated cost 12c. per sq. ft.

Asheville, N. C.—City is considering paving of Magnolia ave. from Cumberland to

N. Main st. with bitulithic.—J. E. Rankin, Mayor.

Wilmington, N. C.—New Hanover County has voted \$50,000 bonds for road and bridge improvements and construction.—D. McEachern, Chairman County Commissioners.

Bryan, O.—Council has decided to pave East High st. with brick as soon as bonds can be sold and other preliminaries completed.

Cincinnati, O.—Cost of improving Turrill st. with brick has been estimated at \$13,927.50 and Moore st. with asphalt at \$2,172.75; Council has decided to improve Ella st. by paving with brick and setting with limestone curbs at cost of \$2,137, and macadamizing Herschel ave. with tar binder, cement combined curb and gutters at cost of \$8,338.75.

Cincinnati, O.—County Commissioners have decided plans and specifications to be prepared for improving Lower River road at a cost of \$10,254 and reported favorably on improving Sharon ave. and macadamizing of Springfield pike at a cost of \$20,000.

Cleveland, O.—Bids will be received June 19, noon, for \$15,000 street opening and \$15,000 grade crossing bonds.—H. L. Davis, City Treasurer.

Dayton, O.—Montgomery County Commissioners will expend about \$35,000 on state and county roads in vicinity of this city.

Tulsa, Okla.—City Commissioner Yeager and City Engineer Huges have recommended eighty blocks of paving at total cost of about \$300,000.

McKeesport, Pa.—Re-paving of Fifth ave. and Walnut st. is being considered.

Washington, Pa.—Improvement of 21 miles of road has been authorized by County Commissioners, highway to be built from bond issue of \$500,000.

Wellsboro, Pa.—Citizens have voted \$49,500 bonds to extend brick pavement.

Columbus, S. C.—Washington st. between Assembly and Sumpter sts. will be paved with wooden blocks.

Belton, Tex.—Precincts 4 and 5 of Bell County will vote July 1 on \$350,000 bonds for road improvements.

Teague, Tex.—Citizens will vote June 29 on \$30,000 bonds for street improvements.—J. H. King, Mayor.

Alexandria, Va.—Improvement of streets and sidewalks at cost of \$100,000 is being considered.

Seattle, Wash.—Cost of grading Lane st. has been estimated at \$152,475.

Spokane, Wash.—City Commission has decided to resurface Northwest boulevard; bids will be asked on various kinds of paving.

Green Bay, Wis.—Council has taken preliminary steps for proposed improvement of streets.

CONTRACTS AWARDED

Gadsden, Ala.—Building sidewalks on 3d st., to C. O. Duncan, \$5,999.10.

Little Rock, Ark.—By City to E. J. Wederstrom for paving in Water-Cross Paving District.

Longbeach, Cal.—Constructing the seaside walk and bulkhead to F. W. Young, Los Angeles, \$95,000.

Los Angeles, Cal.—To Walter Overell for improving Michelterena st., \$3.90 per lin. ft., grading and graveling, 35c. per lin. ft. cement curb, 16c. per sq. ft. cement gutter, 334 sq. ft. vitr. block gutter, aggregate \$12,980.03.

Oakland, Cal.—Sidewalking Shafter ave. and other avenues, to Oakland Paving Co.

Pasadena, Cal.—Grading, graveling, etc., Washington st., between Hill and Lake sts., to J. E. Haddock, at \$10,800; paving with asphalt macadam South El Molino ave., between Colorado and California sts., to James M. Montgomery, \$27,136.

Pomona, Cal.—Street work on Texas st., to Louis Ferrill; grading and oiling, per lin. ft., \$1.80; curbing, per lin. ft., 30c.; sidewalk, per sq. ft., 10c.

Bridgeport, Conn.—Paving State st. for its entire length, from Broad street to its westerly terminus, with wood blocks, to the Farber Asphalt Company to furnish the blocks, \$1.80 per sq. yd., and to Van Keuran & Son, Jersey City, for laying pavement, \$1.25 per sq. yd.

Thompsonville, Conn.—By Selectmen for macadamizing of Pearl and South sts., to Amos D. Bridge Sons, inc.; contract calls for about 11,000 yds., 97c. sq. yd.

Peoria, Ill.—Paving North Orange st. with brick, to J. S. Allen Co., \$7,110.

Brazil, Ind.—To Jas. McGuire & Sons, city, \$2,118, and to L. W. Gibbens & Son, Saline City, \$1,200, for building roads.

Des Moines, Ia.—Paving 35th st., to Bryant McLaughlin Paving Co., Des Moines, \$1.89 per sq. yd.

Fort Dodge, Ia.—Paving 7,500 yds. with concrete to Schweppe & Co. of the St. James Tile & Manufacturing Co., \$1.58 1/2 per yd.

Harlan, Ia.—Laying 13,600 sq. yds. concrete pavement to G. Mancini, \$1.18; other bidders: C. H. Atkins, \$16,665; J. A. Beebe, \$16,679; McMahon & Son, \$16,768; Luna Construction Co., \$18,711; to C. N. Atkinson for 1,250 sq. yds., \$1.29; other bidders: McMahon, \$2,802; G. Mancini, \$2,324; Luna Construction Co., \$2,401; reselling, \$1,885 lin. ft. curbing and gutter to Luna Construction Co., 30c.; 1,429 lin. ft. new curb, 30c.; 565 lin. ft. curb to C. N. Atkinson, 37c.; 770 lin. ft. new curb, 25c.; totals of bids: Luna Construction Co., \$2,475; W. R. Garland & Co., \$2,617; McMahon & Son, \$4,138; G. Mancini, \$2,791; C. H. Atkinson, \$2,616.

Lexington, Ky.—To Carey & Reed, for paving Vine st. with sheet asphalt, \$1.25 per sq. yd.

Lexington, Ky.—By Fiscal Court of Fayette County, to the Home Construction Co. for oiling reconstructed county roads.

Frederick, Md.—Paving South Market and East and West Patrick sts., to United Paving Co., Atlantic City, N. J., \$19,393.

Boston, Mass.—Building highway in Barnstable to E. J. Rourke, Abington, \$10,219; other bidders: M. R. Cavanaugh & Bros., \$11,014; Frank Williams, city, \$11,860 and Thos. Whalen & Co., Wollaston, \$12,114.

Bourne, Mass.—To M. J. Denauet & Co., 999 Chelmsford st., Lowell, for building 1 1/2 miles of State highways, \$8,529.

Groveland, Mass.—Building oil gravel road through School st., to Jas. E. Watkins, Amesburg.

Duluth, Minn.—Paving 10th ave. East with asphalt to P. McDonnell, \$6,713.50.

Kansas City, Mo.—Building 6 miles of rock road between Overland Park and this city, to Dobbins-Wilson Contracting Co., \$45,535.

St. Louis, Mo.—To Parker Washington Co., Taylor and Duncan aves. by the Board of Local Improvement for 19 street improvement contracts, \$45,948; work includes reconstructing street with wood blocks as follows: Taking up old paving, 85c.; granite curb, 83c.; marginal curb, 10c.; wood block, \$2.54; macadam, 1c.

Tilton, N. H.—Grading and surfacing with native stone about 3,500 ft. to Lane Constr. Co., Meriden, Conn.

Cape May, N. J.—To Lemuel Miller, city, for proposed 6-mile road as connecting link of Ocean Boulevard, \$23,751.62; foreign gravel.

Hackensack, N. J.—Road improvements: Franklin Turnpike, 3 sections, with asphalt concrete to G. M. Brewster Constr. Co., Hackensack, \$18,392; from New York State linesoutherly, distance of 9,362 ft., to same, \$35,741; from north line of Allendale to north line of Hohokus, to Geo. F. Brackett, Ridgewood, \$49,274, and for macadamizing road from Saddle River to Park Ridge, to E. Abrahams, Hackensack, \$22,962.

Newark, N. J.—To Ludwig Batt, South Orange, to lay two miles Bermudez asphalt macadam pavement on South Orange ave., South Orange, 97c. per sq. yd.; 3-in. coating on Washington ave., Belleville, 85c. per sq. yd.; to Osborn & Marcellis, Upper Montclair, for resurfacing Springfield ave., 2-in. amesite on one side and 2-in. on other, \$1.19 and 95c. per sq. yd.; resurfacing Bloomfield ave., Caldwell, to Bamberger & Chapman, city; 2-in. amesite, 95c. per sq. yd.

Dunkirk, N. Y.—Paving King st., to J. N. Doyle, Erie, Pa., \$23,000.

Lockport, N. Y.—Cement walk, curb and gutter on LeVan ave., to Contractors C. N. Stainthorpe & Co., \$1,839; other bidders: C. N. Whitore Co., at \$2,710; N. I. France, \$2,879.90; Harry E. Whitney, \$1,974.90, and John Irwin at \$2,670.

Schenectady, N. Y.—To Schenectady Contracting Co. for paving with sheet asphalt, in Huron st. to Henry W. Golden for curbing, laying sidewalks and grading portion of Van Vranken ave.; to John L. Nolan for repaving with granite block a portion of Veeder ave.

Utica, N. Y.—Extension of traffic way on Boulevard from Elm to Mohawk st., to Harry W. Roberts & Co., fluxed Bermudez asphalt, bituminous binder, \$18,940.47.

Yonkers, N. Y.—To Thomas Grady for regulating, grading and otherwise improving Alexander st., Ashburton ave. to the south line of Wells ave., \$25,500, for granite block.

Ashtabula, O.—Paving Market and Hubbard sts., to Thos. Fitzgerald, about \$30,000.

Bucyrus, O.—To Mallory Bros. for building new Winchester road, \$5,308; Bucyrus-Marion road, \$3,511 and Milmore-Marion road, \$2,615.

Canton, O.—To John Wilson, Alliance, for paving with brick 1 mile of Lexington road, \$17,608 and 1 mile of Harrisburg road, \$18,119.

Celina, O.—Road construction to E. & G. Alexander, Mestemaker Pike, \$1,197 and Hemmelgarn Pike, \$5,985, both to be built of screening gravel; to Fishbaugh & Karch,

Chickasaw Pike, \$21,000, road to be built of stone, to Edmett & Engler, Guggenbiller road, \$16,000, gravel.

Cincinnati, O.—To the Joe Grandison Construction Co. for change of route and improvement of Crookshank road, Summit, \$14,386.

Columbus, O.—Paving Summit st., 11th ave. to Mock road, to G. W. Patterson, \$63,000.

Lima, O.—Paving West Elm st. by the Board of Control, to Murray & Jameson, \$14,044; bituminous macadam will be used.

Perrysburg, O.—Paving 2d st. from Hickory to Pine, to T. J. Mulligan, Lima, \$38,335 for Wassell block with cement filler; George B. Campe, Toledo, has been engaged as engineer to look after work.

Wellington, O.—Paving with block paving S. Main and E. Main sts. from plans of Ohio Eng. Co., Elyria, to Lee & Driggs at \$23,991 and \$10,108, respectively; detail bid on S. Main st. is as follows: Excavation, 6,500 cu. yd., 30c.; drain, 3-in., 7,465 lin. ft., 3c.; concrete curb, 7,465 lin. ft., 34c.; split curb, 7,465 lin. ft., 40c.; machine dressed curb, 7,465 lin. ft., 40c.; concrete foundation, 12,700 sq. yd., 48c.; or slag foundation, 12,700 sq. yd., 39c.; or limestone foundation, 12,700 sq. yd., 39c.; paving block, 12,700 sq. yd., 94c., 96c., or 98c., according to different makes; inlets, 12, ea., \$13; 12-in. sewer, 1,000 lin. ft., 40c.; 10-in. sewer, 500 lin. ft., 30c.; 8-in. sewer, 27c.; tar filler, 3c., and headers, 254 lin. ft., 36c.

Grants Pass, Ore.—To the Warren Construction Co. for laying 10,000 sq. yds. of bitulithic pavement.

Beaver Falls, Pa.—Paving number of streets to George B. Clifford, \$24,585; other bidders: Hunter & Hammon, \$25,350; A. V. Prunnett, \$26,329.70; and R. C. McQuiston & Co., \$31,020.70.

Olyphant, Pa.—Paving 1 mile of streets to R. C. Ruthven, \$24,283; other bidders: Stephen Flanagan & Son, \$24,837; R. P. McHugh & Co., \$24,555; Scranton Paving Co., \$24,283.

Reading, Pa.—To Fehr & O'Rourke, city, to lay brick in 6th st., \$11,969.90.

Wellsboro, Pa.—Constructing 9,162 lin. ft. of road extending from Kelsey Creek over West ave. to the Delmar Township line, distance 4,747 lin. ft., and from Main st., over Tioga st., to Delmar Township line, distance 4,415 lin. ft., to E. Whalen, Towanda, \$34,869; other bidders: H. G. Hinkle, Altoona, \$43,985; A. E. Francis, Punxsutawney, \$37,393; Stucker, Wellsboro, \$35,143; John Bradley, Corning, \$31,741.

Nashville, Tenn.—To J. G. Laubheimer, for construction of granitoid curbing and sidewalks on portions of several new streets, 12½c. for sidewalk and 30c. for curbing.

Dallas, Tex.—To Risley Bros. for furnishing Jacksboro rock at 65c. per long ton.

Chehalis, Wash.—To Warren Construction Co. to pave streets with bitulithic; cost about \$57,740.

Everett, Wash.—Paving South Colby ave., to Atlas Construction Co., city, \$50,500.

Seattle, Wash.—Grading and curbing 25th ave., N. W., to J. H. Cullen & Co., \$18,910.50; other bidders: W. F. Manney & Co., \$19,664; N. McKimmon, \$20,709; A. Peterson & Co., \$25,086.50; Agassiz & Hadley, \$24,387.50; R. J. Barter, \$21,339.50.

Tacoma, Wash.—Paving Carr, N. 30th, N. 9th and Starr sts. with sandstone and asphalt, and other streets in Local Improvement Dist. No. 434, to Keasel Constr. Co., \$39,471.

Superior, Wis.—Building cement walks in the Third Ward, eight blocks, to Swan Holmquist, 63½c. per lin. ft. and 75c. per cu. yd. for filling; Fourth Ward contract, about five blocks of walk, to Bergman & Anderson, 58½c. per ft.; Eighth Ward, two contracts, to Ed. Johnson, 58 9-10c. and 59c. per ft.

BIDS RECEIVED

Stockton, Cal.—Grading and paving of county roads: Hogan road, F. C. McIntire, \$28,355; M. B. White, \$28,278.20; W. J. O'Brien, \$23,681.66; McDonald & Jenkins, \$25,993.55; West Side road, W. J. O'Brien, \$28,850; Cotton Bros., \$31,900.

Washington, D. C.—Furnishing Portland cement during the fiscal year ending June 30, 1912: (a) 45,000 bbls. Portland cement f. o. b. 14th and D sts. S. W., (b) alternate proposal, 30,000 bbls. Portland cement f. o. b. 14th and D sts. S. W.; Alpha Portland Cement Co., Easton, Pa., (a) \$1.61 per bbl., (b) \$1.61; National Mortar Co., Washington, D. C., (a) \$1.08, (b) \$1.08; Security Cement Co., Baltimore, Md., (a) 98c., (b) 98c.; Atlas Portland Cement Co., New York, (a) \$1.21, (b) \$1.21; Columbia Granite & Dredging Co., city, (a) \$1.70, (b) \$1.70; Rosslyn Supply Co., Rosslyn, Va., (a) \$1.49, (b) \$1.49.

Herkimer, N. Y.—Paving South Washington st. from Eastern ave. intersection to Smith st., Warren Bros. bitulithic, 5-

inch concrete foundation, \$2.20 per sq. yd., sewer curbing 90c.; D. P. Strood and B. Manion, Corning, metropolitan black brick \$2.20 per sq. yd., curbing 60c.; Frank M. Johnston, Corning, Mack-Shawwide brick \$2.20 per sq. yd., curbing 50c.; 5-in. concrete foundation was provided for in both of the latter bids; bids totaled: Warren Bros., \$5,961.20; Frank M. Johnston, \$6,243.30; Strobel & Manion, \$6,051.96.

New York, N. Y.—Paving Bronx and Pelham Parkway, from Southern Boulevard to Butler st. road; Barber Asphalt Paving Co., 30 Church st., \$17,035; Thomas M. Hart, 2356 Lyon ave., \$13,233; Sicilian Asphalt Paving Co., 41 Park Row, \$16,883; Uvalde Contracting Co., 1 Broadway, \$17,492—(arence L. Hill, Clerk of Park Board.

Dayton, O.—Low bidders upon recent letting of street improvement contracts: Troy, from Leo to Valley, J. O. Shoup, limestone \$37,588, berea \$37,698, cement \$37,518; Lexington ave., from Broadway to Deal ave., J. E. Conley, limestone \$29,310, berea \$28,977, cement \$28,520.

Perrysburg, O.—Paving 2d st.: brick, Garrigan Bros., Toledo, \$38,335; M. F. O'Sullivan, Toledo, \$40,569.60; A. A. Reilly, Toledo, \$41,204.76; E. E. McKinney, Toledo, \$44,872.80; D. J. Mulligan, Lima, \$35,538.68; Hennessy & Bro., Piqua, \$37,820.80; T. S. Saxton Co., Richmond, Ind., \$37,820.80; W. W. Hatch, Detroit, \$29,092.62; sheet asphalt, C. Marsman, Grand Rapids, Mich., \$41,667; asphalt block paving, Asphalt Block Paving Co., Toledo, \$40,064.

Butler, Pa.—Paving First st. and Brugh ave.: Norman J. Boyer on 1st st., excavation 35c., paving \$1.12 to \$1.30, pitch filling 15c., sand filling 2c., cement curb 18-in. curb 60c., 24-in. cement curb 70c., stone curb 52c., resetting stone curb 50c., repaving \$1 per sq. yd.; Brugh ave., excavating 30c., paving \$1.20 to \$1.27, repaving \$1; 18-in. cement curb 57c., 24-in. cement curb 70c., pitch filling 13c., sand filling 2c.; Tony Morelli, 1st st., excavating 29c., paving \$1.10, repaving \$1, pitch filling 15c., sand filling 2c., cement curb 56c. and 65c., stone curb 48c., resetting curb 30c.; Brugh ave., excavating 29c., \$1.13 to \$1.35 for paving, \$1 for repaving, cement curb 56c. to 65c., stone curb 48c., resetting stone curb 30c., pitch filling 15c., sand filling 2c.; John Mazza, 1st st., excavating 37c., paving \$1.15 to \$1.37, pitch filling 15c., sand filling 2c., cement curb 58c. to 73c., stone curb 50c.; Brugh ave., 37c. for excavating, \$1.17 to \$1.39 for paving, 58c. to 75c. for cement curb and 50c. for stone curb.

Knoxville, Tenn.—Street improvements: Barber Asphalt Co., asphalt paving 6 in. base, \$1.88 per sq. yd.; excavation, 57c.; solid rock, \$3, and \$1.78 on 5 in. base; R. S. Blome Co., granitoid paving on all districts, \$1.88 sq. yd.; excavation, 47c.; Cresosot Wood Block Paving Co., \$2.54 on 5 in. base and \$2.66 on 6 in. base; excavation, 53c.; Graves-Matthews Paving Co. of Birmingham bid only on Central st., brick paving, pitcher filler, 5 in. base, \$2.18, 6 in. base, \$2.24; excavation, 70c.; Mann Construction Co., of Knoxville, on same grade of brick as the Birmingham firm, pitch filler, 5 in. base, \$2.17 per sq. yd., 6 in. base, \$2.22; macadam with tar or oil binder, \$1.16 per sq. yd.; excavation, 61c.

SEWERAGE

Lindsay, Cal.—Citizens will vote June 28 on \$75,000 bonds for acquisition of outfall sewer system.

Athens, Ga.—Citizens will vote July 11 on \$200,000 bonds to erect jail and court house.

Barnesville, Ga.—Surveys are being made by M. B. McCrary & Co., Atlanta, preparatory to extending sewer system.

Thomaston, Ga.—Bids will be received June 15 for \$45,000 sewerage and water works bonds.—R. E. Ruslin, City Clerk.

Crawfordsville, Ind.—Plans are being prepared by E. R. Warbritton for the construction of about 700 lin. ft. of 8-in. sewer in Market st.—F. B. Robinson, Clerk, Board Public Works.

Council Bluffs, Ia.—Council has decided to construct 10 miles sewer on McPherson ave.—C. J. Duff, City Clerk.

Mulvane, Kan.—Plans have been prepared for construction of sewer system; estimated cost, \$8,000.

Winchester, Ky.—Council has decided to ask for bids for installing sewerage disposal plant.

Morgan City, La.—K. A. Kramer, Magnolia, Miss., will make survey for sewerage and water works system; cost about \$60,000.

Lynn, Mass.—Council has ordered construction of public sewer on Michigan ave.

Malden, Mass.—Street and Water Commission intends this summer to build large section of sewer in section east of Suffolk Square.

St. Paul, Minn.—Board of Public Works has rejected all bids for construction of Goodrich ave. sewer.

Trenton, N. J.—Council has decided to construct sewer in Wayne ave.

Albany, N. Y.—Council has passed ordinance for building sewer in Livingston ave. and Black road.

Ilion, N. Y.—Board of Sewer Commissioners has adopted plans for proposed Morgan st. sewer.

Port Chester, N. Y.—Question of sewer disposal plant will be considered by Committee of 12 citizens appointed by the President, to confer with committee having matter in hand.

Edenton, N. C.—W. J. Berryman, Secretary, sewerage committee, desires correspondence with engineers on sewer construction.

Cincinnati, O.—Council is considering construction of sewers in three streets.

Dayton, O.—Board of Control has decided to reject bids for construction of sewers in vicinity of Bolander ave.

Grants Pass, Ore.—Council is considering plan submitted by City Engineer F. E. Hobson to construct two large reinforced concrete conduits for drainage and sanitary sewer purposes along natural channels of Gilbert Creek on the west, and Skunk Creek on east side of the city, which will serve entire city as sewer mains leading to Rogue River; estimated cost \$150,000.

Grants Pass, Ore.—Bids will be received about July 15 for construction of a 24-in. concrete drainage sewer.—F. C. Hobson, City Engineer.

Lebanon, Pa.—Council has approved specifications for proposed house sewer system as designed by City Engineer Crowell, also specifications for sewage disposal plant as prepared by Engineer Jas. H. Fuertes, of New York.

Ligonier, Pa.—Borough Council has passed a resolution to build sewage disposal plant and pumping station; plans have been prepared by F. H. Shaw, of Lancaster, and bids will be taken in the near future.—I. F. Brant, Clerk.

Reading, Pa.—Council is considering building of storm sewers on Spring and Maple sts.

Mount Pleasant, Tex.—Citizens have voted \$16,000 bonds to install sewerage system; plans will be prepared at once.

Salt Lake City, Utah.—Construction of the proposed sewer outlet canal from the present outlet of the gravity sewer on the sewer farm to the waters of Great Salt Lake has been authorized by Council and Board of Public Works instructed to call for bids on the canal at once; estimated cost, \$18,000.

Petersburg, Va.—Council is considering extension and improvement of sewerage system.

Ronceverte, W. Va.—Citizens have voted \$16,000 bonds to extend sewer and water works systems.

Reedsburg, Wis.—All bids opened May 17 for construction of trunk sewers along Franklin st. sewer district have been rejected; proposed work consists of 1,650 lin. ft. 20-in. pipe, 1,200 lin. ft. 27-in. pipe, 1,410 lin. ft. 18-in. pipe; the trenches varying from 8 to 20 ft. in depth, with 10 manholes and 22 catch-basins.

Cannington, Ont., Can.—Plans are being prepared for drainage system; cost \$3,000.—Cavana & Watson, Oullia, Engineer.

CONTRACTS AWARDED

Frederick, Md.—To Bond & Bates, Baltimore, to construct one section of storm sewers, including catch basins and manholes, \$4,892.12.—E. C. Crum, City Engineer.

Malden, Mass.—Furnishing quantity of sewer pipe, to D. W. Lewis & Co.

St. Paul, Minn.—Sewer contracts: Eaton ave., from Indiana to Fairfield, to P. J. Ryan, \$337; St. Clair st., from Mcalester to Snelling, to Christ Johnson, \$1,486; Hathaway st., from 7th to Adrian, to C. A. Nelson, \$1,210; Front st., from Western ave. to Mackubin st., to P. J. Ryan, \$1,555; Jessie st., from Whiteall to York st., to O'Neill & Preston, \$1,029.

St. Joseph, Mo.—Constructing 5th ave. main sewer to D. B. Kelly, about \$7,000.

Perth Amboy, N. J.—Laying sewers in Jeffries and Johnstone sts., to Martin Hansen, \$2,080.

Fargo, N. D.—Building sewer on 15th st. North, to Gilbert W. Haggart, \$1.28 per lin. ft., \$57 for manholes and \$59 for catch basins.

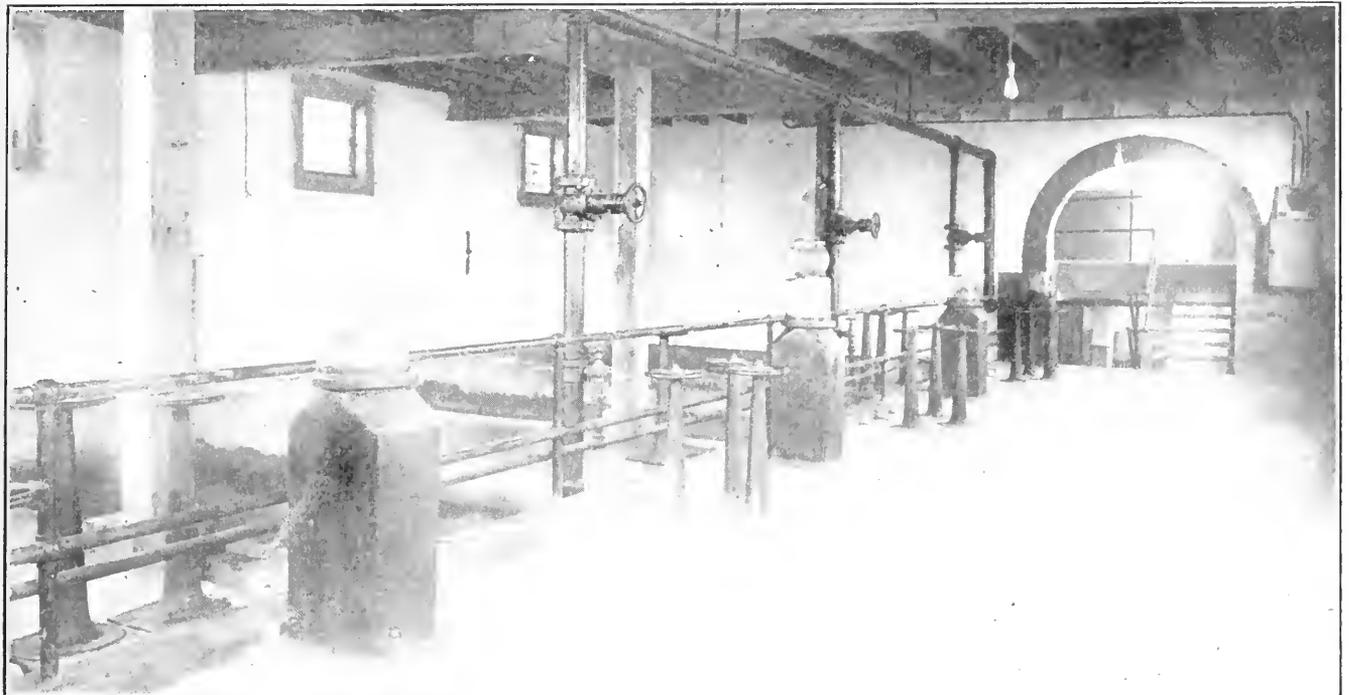

Chester, Pa.—Building sewers, to Pritchard & Oliver, Crosby st.: 15 in. terra cotta, \$1.23; Y's, 75c.; manholes, \$39; rock, \$4.50; Edwards st., etc., 8 in. terra cotta, 90c.; Y's, 50c.; manholes, \$39; rock, \$4.50; Engle st., 15 in. terra cotta, \$1.24; 8 in. terra cotta, 92c.; 15 in. Y, 75c.; 8 in. Y, 50c.; manholes, \$39; rock, \$4.75; Concord ave., 8 in. terra cotta, 46c.; Y, 50c.; manholes, \$39; rock, \$4.75; to John Hanna's Sons: Esrey st., 8 in. terra cotta, 92c.; Y, 50c.; manholes, \$39; rock, \$4.75; 15th st., 15 in. terra cotta \$1.25; 8 in., 92c.; 15 in. Y, 75c.; 8 in. Y, 50c.; manholes, \$39; rock, \$4.75.

OPERATING FLOOR, GRAND FORKS FILTERS

GRAND FORKS RAPID SAND FILTERS

Two Small and Two Large Settling Basins—Alum and Hypochlorite Fed Together into Water—Most of Purification Effected in Settling Basins—Water Reaching Filters Practically Sterile

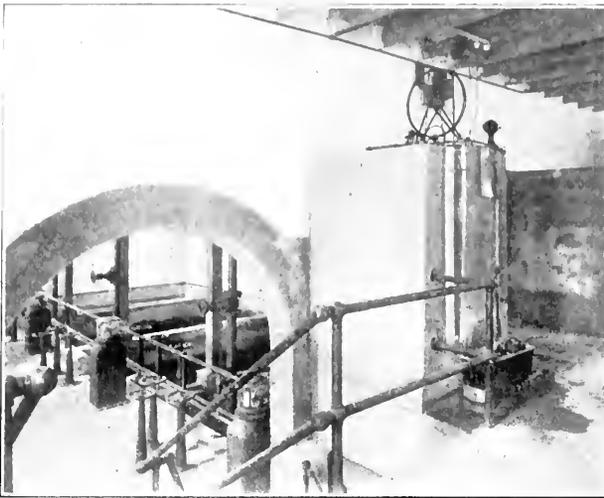

By H. G. LYKKEN, City Engineer

THE city of Grand Forks, N. Dak., takes its water supply from the Red Lake River which has a flow ranging from 600 second feet at its lowest stages in the winter time to an average summer run off of about 2500 second feet. During the spring freshets and after rains the water is very turbid, carrying a fine clay with some black loam from the fields along the bank. There is, however, more or less turbidity at all times.

The hardness averages about 17 grains per gallon, equally distributed between the sulphates and carbonates of lime and magnesia. The water is considerably polluted by the sewage from small towns above the city. In the winter time, when the flowage is at the lowest stage and the river frozen over with from one to two feet of ice, the B. coli will average for weeks at a time over 20, and often run over 40 per cubic centi-

meter. In the summer time this falls down to an average of about four. The bacterial content runs from 1,000 to 1,500 in the winter and increases to 7,000 to 10,000 in the summer.

The city of Crookston, with a population of 7,500, is situated about thirty miles up stream and is the chief source of the sewage contamination. By hourly bacteriological tests of the water at Grand Forks, made especially at its lowest stages in the winter time, it has been possible to show a decided fluctuation in the presence of the B. coli corresponding to the maximum and minimum flow of the sewage in the city above. The sewage flow in a city of this size will be very small at certain hours of the night with a maximum occurring at a certain time or times during the day. Owing to the small amount of water flowing in the river a decided variation in the pollution will

HYPO TANK, WITH GLIMPSE OF OPERATING FLOOR.

consequently result. The fact that this variation can be detected is proof of the positiveness and directness of the contamination and its dangerous character if charged with germs of pathogenic origin.

The first attempt at water purification in Grand Forks had its inception in a frightful typhoid epidemic that devastated the city in the spring of 1894, when about 25 per cent of the population was stricken and about 200 deaths occurred. A slow sand filter of one-half acre, modeled after the Lawrence, Mass., plant, was installed the same fall. This filter did service till the fall of 1910, although having been inadequate in size for some years. During all this time few tests were made as to its efficiency, as no pronounced epidemics of typhoid again occurred and it was generally taken for granted that the filter made the water safe. No doubt a great improvement was effected; at least, the water was perfectly clear and free from turbidity and color at all times.

Yet only 20 per cent of the more frequent tests made of the water during the last two years that the slow sand filter was in service showed absence of *B. coli*. In other words, the water was never safe, as disease germs might get through and be present at any time. This is readily understood when the great contamination of the water is considered, and in view of the further fact that, owing to the turbidity of the water it was sometimes necessary to scrape the sand as frequently as every ten days. The settling basins, even with the use of alum, seemed unable to remove the finer silt that would clog the sand. As only the one sand bed, run at its maximum capacity, was provided, it was necessary to begin filtering immediately after the scraping, if this could be called filtering.

Two facts can be established out of the experience of this city with a slow sand filter. One is the absolute necessity of two or more beds with capacity sufficient that a scraped bed can be properly put in condition for filtering before it is again put into service, which requires at least four or five days. And a second is the almost certain futility of attempting to filter turbid water with a slow sand filter. I mean here river water with fine clay in suspension that even several days of sedimentation will not remove. The cost of scraping or cleaning the sand beds, with the unavoidable loss of sand, makes it too expensive.

On account of the high cost of sand, heating the filter and settling basins in winter, and frequent scrapings, it cost from \$5,000 to \$7,000 a year to operate the one-half acre of sand. The average water consumption was less than 1,000,000 gallon per day, making the filtration costs excessive.

In the fall of 1910 the City Council voted to make the change to a rapid sand filter with increased capacity, and the plant now installed was constructed by the Pittsburgh Filter Company in accordance with plans made by the writer. Considerable opposition was met with at first from those who had taken it for

granted that the slow sand filter had always given perfect results, and who were reluctant to try something they thought new. Owing, however, to the location of the old filter plant in a place where no additional ground was available for increasing its size to meet the increasing demand for water, and also to the fact that it was becoming more and more difficult to get the quality of sand necessary, all opposition had to give in.

The additional building made necessary by the new filter consists of a brick structure 35 feet by 78 feet, two stories in height, having reinforced concrete floors throughout. This building was constructed on part of the space formerly occupied by the old sand bed. The rest of the space is used as settling basins. A concrete wall dividing this old filter bed into two equal parts was also constructed, as shown by the plans.

As best shown by the plan here referred to, the plant consists of two small trough-like basins into which the water is first pumped and flows the entire length of both. They are so arranged, however, that either one can be thrown out of service for cleaning, at which time the water is pumped into the other. Being trough-like in construction, with slanted openings at the bottom, they are readily cleaned by simply drawing them off while keeping the material in agitation with a fire hose. A basin half full of mud is cleaned out in a few hours' time with a minimum loss of water and labor.

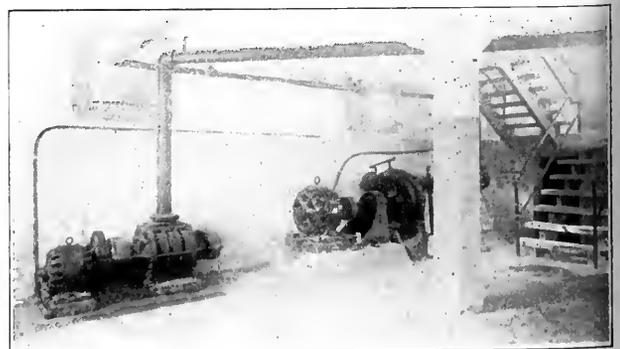

As the water leaves the small settling basins it enters a distributing chamber where it is controlled by gate valves and may be let into either or both of the larger settling basins. The water is distributed along one end of these large settling basins by a vitrified pipe imbedded in concrete and placed along the floor. Openings are provided at intervals of 2½ feet. No baffles are used and the water is permitted to move freely to the opposite end of the basins, which are 140 feet in length. At this end the water is taken off near the top by a collecting trough from which it enters the filter building. The water is carried at about 10 feet in depth in all the basins.

The present plant was designed for 2,000,000 gallons capacity in four units, the basins being made somewhat larger, however, than is the general practice on account of the small head available. Space for four additional beds is provided for when the need of the city may demand it. On the first floor of the filter building is a large room, 26 by 33 feet, in which the wash pump and blower are located, and which provides ample room for storage of chemicals, etc.

A door with a few steps down leads into the filter gallery. A stairway up leads to the operating floor in front of the filter basins, and, in the front end of the building, to the mixing tanks and the operator's office.

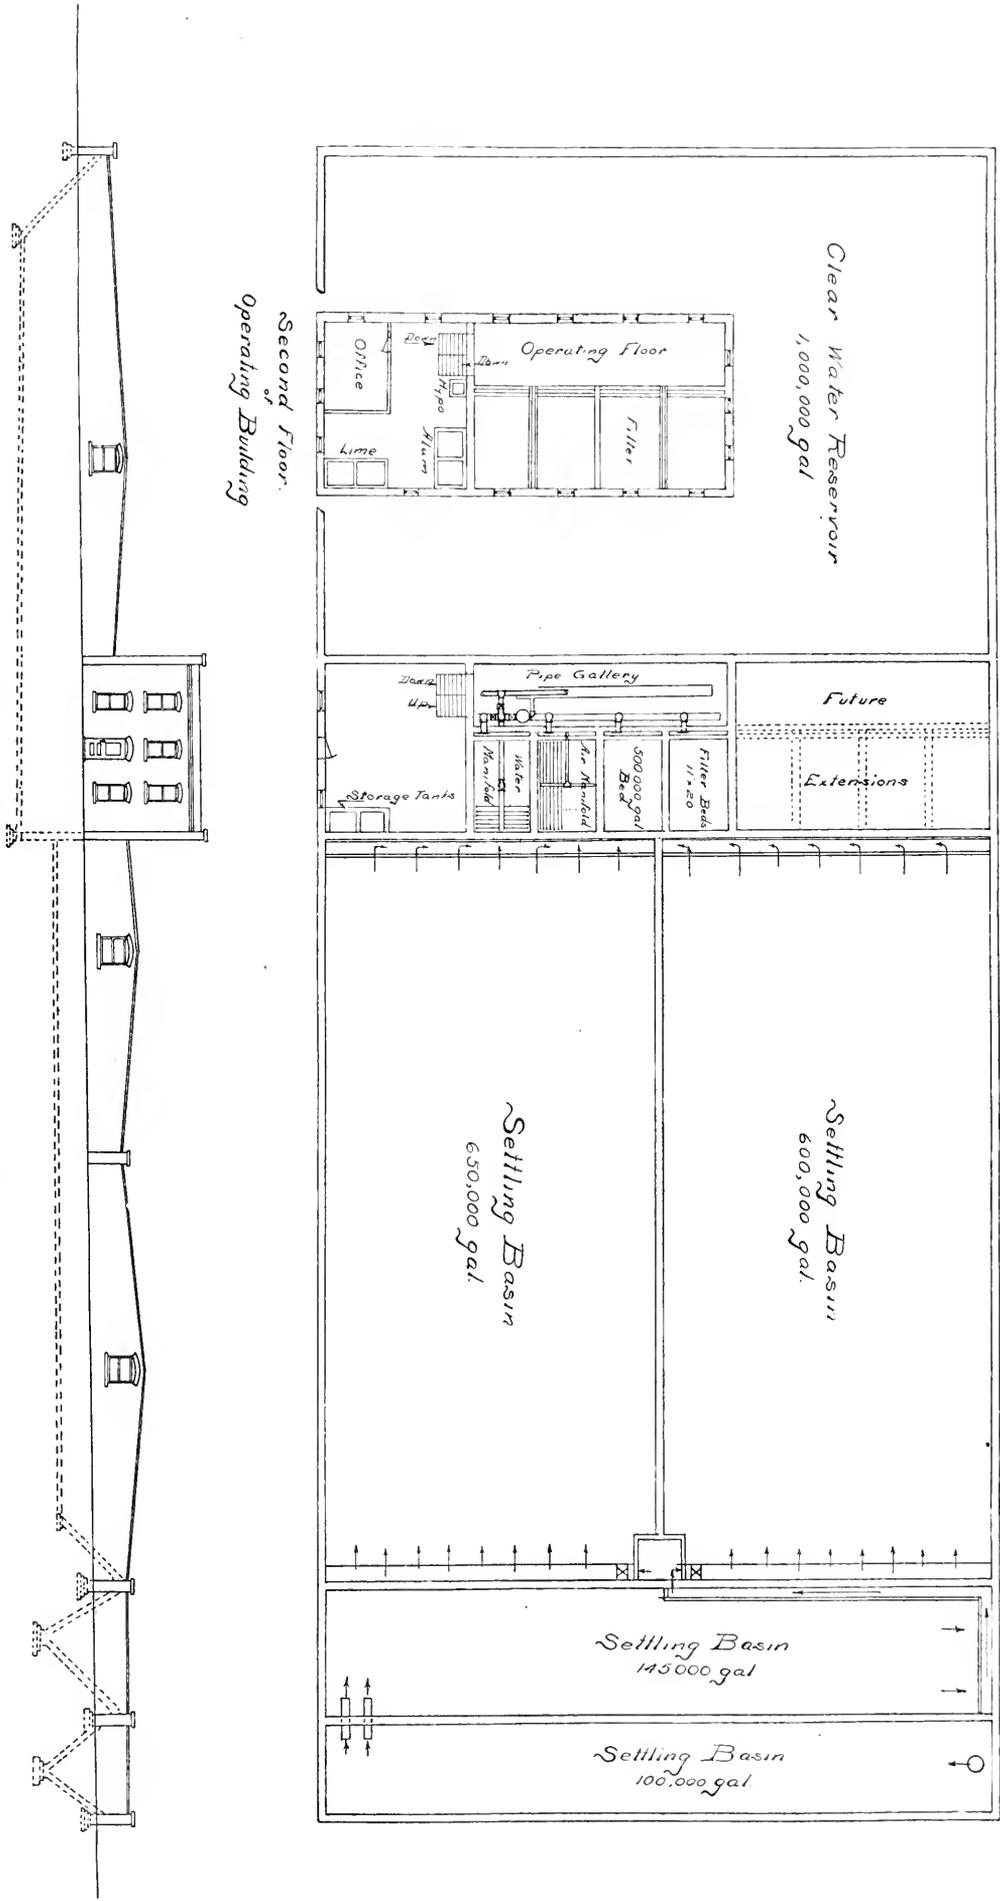

The water as it enters the filter building flows in a trough between each pair of filter beds to the operating end of the beds, where all gates for controlling the water both for filtering and washing are located. The filtered water flows into the 1,000,000 gallon clear water well, or may be by-passed directly to the pumps.

From 10 to 15 pounds of aluminum sulphate and one pound of hypochlorite of lime per 100,000 gallon of water filtered

WASH PUMPS AND BLOWER.

PLAN AND SIDE ELEVATION OF FILTER PLANT, GRAND FORKS

is used. These chemicals are mixed in separate concrete tanks in the mixing room, a continuous stirring device being used in the hypo tank. Both solutions are then run in the same pipe and enter the raw water in the supply pipe from the pump. This method of feeding the chemical was determined upon after considerable experimentation and feeding the chemicals at various points and in various ways. The results establish beyond a doubt that the chemicals fed in this manner do not interfere with each other; on the contrary, the proper reaction seems to be facilitated, though this has not been accurately established.

The water is tested by a competent bacteriologist two to three times a week, several samples being taken each time. After several months of service in no single instance has *B. coli* been found in the filtered water. The number of bacteria in the filtrate average below 20 per cubic centimeter. When it is considered that at all times the water is highly polluted and that during the greater part of this period the *B. coli* ran from 30 to 40 per cubic centimeter, the efficiency of the treatment becomes apparent, and in addition the fact that the efficiency of the hypo is in no way impaired by being added to the water in its muddiest condition, as it enters the settling basins, and together with the alum. The hypo is, of course, the chief agent accountable for the bacteria efficiency, but being added in the small quantity of one pound to each 100,000 gallons of water certainly no objection can be raised against its use. The cost is negligible.

The whole available settling area is utilized, with the result that the water as it enters the filter beds is fairly clear irrespective of how muddy it may be in the river. Most of the mud is thrown down in the small basins, where it is readily washed out. Most of the remaining material goes to the bottom in the larger basins, which can be alternately drained and cleaned. It is anticipated that one cleaning a year will be sufficient with these, however.

At the present rate of filtration, 24 to 36 hours elapse between the time of application of the alum and the time the water reaches the filters. This is perhaps not in accordance with common practice, but no difficulty is experienced in getting a blanket on the filters. Sufficient material goes over, whether it be alum flock or just clay, to form the proper filtering medium. Care is taken to let each bed stand for some time after each washing to permit the sand to adjust itself and the slime film to form on top. In this case no attempt is made to depend on the filter beds to strain out the bacteria. The filters as operated give a perfectly colorless and clear water. The preliminary treatment in the settling basins is depended upon for the bacteriological efficiency.

The advantage of this method of operation is obvious. All the water in the settling basins is practically sterile so that a slight variation, or even cessation for hours of the chemical will not let any untreated water through. Much less alum is necessary as only sufficient to remove and settle the mud is used. The absence of a heavy blanket necessary for a high bacterial efficiency by the straining process alone, necessitates less washing of the beds, also less careful and expensive attention.

The filter works continuously, but is operated by one man, a young boy receiving a mere nominal wage, and such assistance by the general superintendent of the water works as may be necessary when the beds are washed. No watchman is on duty during the night, as the relative height of water in the different basins is controlled from the pumping station. The filters are washed once a week, the water being supplied by a centrifugal pump and the air by a Root blower, both electrically driven from the city power plant.

The plant is provided with automatic rate controllers, recording loss-of-head gages, and the best equipment possible in chemical feed devices and other appliances. With two to three times the amount of water available and provisions for doubling this capacity, the new filter is being operated at less

than one-quarter the cost of the old plant. But of more importance is the fact that the water is always absolutely safe, clear, colorless and sparkling. During the spring months color due to swamp vegetation gave trouble with the slow sand filter. This has been entirely eliminated; whether it be due to the alum treatment or a bleaching effect of chlorine has not been determined.

The writer has studied in detail the plans and results of some seventy filtration plants and found that a common mistake is to make the settling basins too small. The experience of plant after plant has been that all waters carrying any silt whatsoever require more time for settling than is commonly supposed, and that in no case can the basins be too large. The settling and coagulating basins, if indeed the two can be made distinct, are in my opinion the main elements in modern water purification. By the judicious use of alum, the settling silt and alum flock will carry down much of the impurity. Then, by sterilizing the water, as well, at this point, or at least destroying all the pathogenic germs, the main object of any purification works is accomplished. By having the basins large they will act as a regulator or factor of safety interposing a large amount of safe water between the raw water supply and the filter effluent. No sole dependence need in this case be placed on purely mechanical devices or the care of operators.

The filter beds become merely finishers in the process, removing the silt and suspended matter that still may remain in the water as well as to do all any filter can do in removing whatever bacteria that may get to them. The modern type of rapid sand filter is eminently suited for this purpose on account of its simplicity and economy in operation. With conveniently arranged settling basins, the cost of water purification becomes a small matter in cost. Where no sewage pollution exists the sterilizing can, of course, be dispensed with. A coagulant added in large basins, giving the water ample time to settle, reduces the cost of filtering to a minimum. With sewage-polluted water, however, sterilization in the settling basins has much to commend it and reduces both the difficulties of attaining the results required and the cost of operation.

NEW YORK'S HEALTH CONDITIONS

MORTALITY records of New York City for the first quarter of 1911, which have recently been made public, show most gratifying improvement over those of previous years. The death rate from all diseases was 17 per thousand, as against 17.43 during the first quarter of 1910. Comparing this year with the previous five years we find a falling off in the number of typhoid deaths of 35, diphtheria and croup, 261, consumption, 250, acute respiratory diseases, 545, and smaller decrease in most of the common diseases; there being increases, however, in the deaths from whooping cough, influenza, organic heart diseases, diarrhoeal diseases under five and accidents; each of these increases running under one hundred, except heart disease. As these are total cases, with no allowance for increase in population, the percentage rates would show still more favorable figures. Most of the decrease was among the younger children, amounting to 468 deaths in children under one year, and 1,099 in children under five years. On the other hand there was an increase of 85 in those over 65 years. As death must come at some age to every one, sanitation and medicine can but postpone it, consequently the measure of their effectiveness is not only the reduction of death rates but also the transferring of deaths from the younger to the older groups of the population.

There was a decrease of 1,575 deaths in tenement houses an indication of the fact, actually shown by other figures, that a large percentage of the child mortality is found in such districts. The general death rate during the previous five years had been an average of 18.33; therefore the rate during this quarter of 1911 was more than 7 per cent. lower than the average for the previous five years.

SEWAGE-POLLUTED SEA WATER

Chemical Changes Occurring in One Per Cent Mixtures of Sewage with Sea Water, as Determined by Laboratory Experiments

An investigation of the chemical changes which occur in a water when mixed with one per cent. of sewage was made for the Royal Commission on Sewage Disposal (England) by A. Letts and E. H. Richards, the former professor of chemistry in Queen's College, Belfast, and reported upon in a paper before the Royal Institute of Public Health. This paper, somewhat condensed, was as follows:

Eighteen samples of sea water were collected from the Irish Channel and analyzed. The average and extreme results obtained were:

	NITROGEN IN PARTS PER 100,000 AS:	
	Average.	Extremes.
Free ammonia.....	0.0003	0.0014—0
Albuminoid ammonia.....	0.0073	0.011 —0.005
Nitrates.....	0.0043	0.009 —0.002

Free Ammonia.—It will be seen that the amount of this factor was minute, but the authors have satisfied themselves that it is apt to increase when the samples are kept. This fact is given considerable trouble in certain of the experiments which they are conducting. The authors have some grounds for believing that the increase in ammoniacal nitrogen is due to the decay of the minute organisms which constitute the *fauna* found in both fresh and sea water.

As this matter is of some importance, further experiments are in progress.

Albuminoid Ammonia.—It will be seen that on an average the amount in the samples was about twenty-five times as great as that of the free ammonia, and the question arises as to how much of this is due to living organisms, and how much dissolved nitrogenous compounds?

Experiments are therefore in progress on this matter, the object being to determine the albuminoid ammonia in the sample drawn, and again after filtering it through a Pasteur-Chamberland filter.

Nitrates.—The authors have satisfied themselves that nitrates were present in the samples of sea water examined by them. A certain of these nitrates were tested for qualitatively, and their presence at once indicated either by the blue tint which was produced when some of the water was added to a 2 per cent. solution of diphenylamine in sulphuric acid, or by the mucic test. Regarding the latter, 25 c.c. of the sea water placed in a porcelain dish along with a few drops of brucine-phosphate solution, and 25 c.c. of strong sulphuric acid added, showed the transient pink color quite distinctly and a well-marked yellow tint afterwards, which was permanent for twenty-four hours, while in a comparison experiment with the same quantities of distilled water and reagents, the mixture remained colorless.

The nitrates were determined by the zinc-copper couple in place of a better method, and while it is possible that the determinations were affected by the effect which Purvis and Burtauld discovered in relation to the breaking down of the organic matter by the couple, with evolution of ammonia, the error, if introduced at all, was probably minute and sufficiently constant to render the results strictly comparable with each other.

A study was made of the chemical changes occurring in one per cent. mixtures of sewage and sea water from the Irish Channel and these compared with those taking place in corresponding mixtures of sewage and fresh water, the samples being incubated in completely filled and stoppered bottles at finite temperatures after being saturated with air at those temperatures.

Three series of such experiments have been made, viz:
(1) With one per cent. Belfast sewage (screened and settled) at 65° F. for five days. (One analysis of each).

(2) Ditto. (But with a sample collected on a different day) at 80° F. (Analyses were made of the original mixtures when made and after intervals of one, four, seven and thirty-five days).

(3) Ditto. (But again with a sample of sewage collected on a different day) at temperatures of 60°, 70° and 80° F. respectively. (Analyses were made of the original mixtures when made and after intervals of five, fourteen and forty-two days).

In all, nearly 300 separate determinations were made, so that the work was laborious.

The following general conclusions were drawn by the authors from the results of the analysis.

(a) **Free Ammonia.**—In each of the three series the analysis of the original mixtures showed a distinctly greater yield of free ammonia in those containing sea water. Thus:

NITROGEN AS FREE AMMONIA AS PARTS PER 100,000 IN THE ORIGINAL MIXTURE.		Ratio of Ammonia in Sea-water mixture to that in Tap-water Mixture.
Sea-water Mixture.	Tap-water Mixture.	
(1) 0.030	0.017	176:100
(2) 0.030	0.018	167:100
(3) 0.041	0.035	117:100

Probably this effect is due to the action of the alkaline salts in the sea water on the nitrogenous matters of the sewage. Obviously, this is a point of considerable importance when interpreting the results of analysis of polluted sea water samples, for if the amount of free ammonia be taken as the index of sewage pollution, as is frequently done, a given sample of sea water may appear to be much more highly polluted than a sample of fresh water containing the same proportion of sewage, and it may be nearly twice as much.

(b) **Albuminoid Ammonia.**—This did not diminish by more than about one-third of the original amount in either of the series after an interval of five to six weeks. Both the fresh and sea water mixtures behaved similarly as regards this factor, and temperature did not appear to exercise much influence on it in either.

(c) **Dissolved Oxygen.**—The rate of disappearance of dissolved oxygen in four or five days at temperatures between 60° to 80° F. was very similar for both the sea and fresh water mixtures. Thus:

DISSOLVED OXYGEN DISAPPEARING IN C.C. PER LITRE AT N.T.P.		
Tap-water Mixture.	Sea-water Mixture.	
(1) 1.5	1.4	5 days at 65° F.
(2) 1.1	1.4	4 " 80° "
(3) { 1.2	1.6	5 " 60° "
	1.8	5 " 70° "
2.4	2.0	5 " 80° "

These results have a certain amount of importance as it has been suggested that the salts of sea-water interfere with the growth and inhibit at an early stage the development of the organisms present in sewage.

There is good reason for believing that disappearance of dissolved oxygen in polluted waters is largely, if not entirely, due to micro-organisms, the process in its earlier stages being analogous to respiration, and as a consequence the oxygen becoming converted to a considerable extent into carbonic anhydride (as was indeed proved to be the case in the experiments performed by the authors); and if this be so, the disappearance of dissolved oxygen is an index to bacterial activity, which was therefore considerable in the periods mentioned above, and was practically the same in both the sea and fresh water mixtures. The authors are therefore of the opinion that the salts in sea-water do not inhibit the first or "carbon" stage of fermentation occurring in such water when polluted.

(d) The disappearance of dissolved oxygen after five or six weeks is distinctly greater in the tap-water than in the sea-water mixtures. Thus:—

DISSOLVED OXYGEN DISAPPEARING IN C.C. PER LITRE AT N.T.P.		
Tap-water Mixture.	Sea-water Mixture.	
(2) 4.6	3.8	5 weeks at 80° F.
(3) { 3.3	2.8	6 " 60° "
	2.9	6 " 70° "
5.2	4.5	6 " 80° "

But it must be recollected that sea-water saturated with air

at a given temperature contains less oxygen than fresh water similarly saturated. Thus: One litre sea-water saturated with air at 60° F. and 760 mm. contains 5.8 c.c. dissolved oxygen at N.T.P.; one litre distilled water under the same conditions contains 7.2 c.c.

Distilled water therefore contains over 22 per cent. more dissolved oxygen under these conditions than sea-water.

But apart from this, the more rapid disappearance of dissolved oxygen from the tap-water mixture is probably to be explained by differences in the behavior of the two mixtures in respect of the second or "nitrogen" stage of fermentation which occurs in polluted waters.¹

(c) *Nitrification*.—This nitrification occurred to a decided less extent (under the conditions of the authors' experiments) in the sea-water than in the tap-water mixtures. In the latter it commenced about the fourteenth day and was practically complete (in relation to the free ammonia originally present) in five weeks. While on the other hand the most favorable result with the sea-water was the nitrification of less than one half the free ammonia originally present.

Nitrates were determined by the zinc-copper couple in all the samples, and while it is possible that the results in the case of the sea-water mixtures were influenced by the Purvis-Courtauld effect, the error if introduced at all would probably be the same in all the determinations and would therefore not affect the results in relation to the gain in nitrates.

C. Fowler concluded that only the stage of nitrite formation is reached when sea-water is incubated with sewage sludge. Adeney (*loc. cit.*) came to the same conclusion in comparative experiments with 20 per cent. mixtures of sewage and tap-water on the one hand, and sea-water on the other, the experiments being carried out under aerobic conditions, while Purvis in collaboration with others, also observed the production of nitrites in incubated samples of sea-water polluted with sewage.

The authors at the end of their experiments in Series 3 examined carefully for nitrites in all the samples, but their notebooks only record "doubtful traces" in the cases of two of the sea-water mixtures.

As this matter is one of some importance, and the results obtained as yet are not absolutely conclusive, they are conducting further experiments on it.

(f) *Effects of Temperature*.—Regarding the effects of temperature on the nature and speed of the chemical changes occurring in the polluted mixtures experimented with, there can be no question that the amount of dissolved oxygen disappearing was greatest throughout the experiments of 80° F., least at 60° F. and intermediate at 70° F. in both the sea-water and fresh-water mixtures.

But it is difficult to say whether nitrification was promoted or retarded by increase of temperature.

In the third series of experiments with the tap-water mixture the latter effect was observed, while with the sea-water mixtures the results were irregular and not carried far enough to be conclusive. At the highest temperature, the exhaustion of the oxygen by the carbon fermentation was quite possibly too great to allow of the subsequent nitrogen fermentation, and also the amount of dissolved oxygen originally present was lowest.

At 60° F. not only was more oxygen present originally, but the results show that after a fortnight or so, both kinds of fermentation proceeded together, so that it is conceivable that the relative powers of the two classes of bacteria concerned were more evenly balanced.

If such were the case, it may involve a practical point of some importance, for in the case of a water continuously polluted in warm weather the whole of the available oxygen may be used up in carbon fermentation as fast as the water

it naturally aerated, and nitrification as a consequence be impeded.

In colder weather on the other hand, nitrification may proceed more rapidly or with greater ease.

The fact that green *algæ* are most abundant in water at the time of the year when the former conditions prevail, may perhaps be Nature's provision to balance matters, since by the absorption of ammoniacal nitrogen these *algæ* would prevent an excess of unoxidized nitrogen from accumulating in the water, while the *algæ* would also arrest or prevent putrefactive changes by supplying an abundance of dissolved oxygen.

MISSOURI BILLBOARD DECISION

THE Supreme Court of Missouri recently handed down a judgment affirming a previous decision sustaining the St. Louis billboard ordinance. This ordinance was passed in 1905 as part of a revised building code; an injunction was granted in January, 1906, appealed from at once by the city and a decision rendered in March, 1910, one judge dissenting. This decision has just been affirmed.

The sections of the ordinance in question required:

1st. That no structure, building or shed could be altered, repaired or removed without a permit from the Commissioner of Public Buildings.

2nd. That various fees should be paid for such alteration or repair, one dollar being the fee for every 25 feet of the area of a sign and one dollar for every 5 lineal feet of a billboard.

3rd. That no rotten or unsafe sign shall be permitted in any place and that no sign exceeding 20 square feet shall be erected on any building without a permit. None but metal signs may be attached to any building if larger than 3½ by 10. No sign shall project more than 18 inches over the building line, nor nearer than 8 feet from the ground or pavement, nor to interfere with any fire escape.

4th. No billboard having more than 25 square feet of area shall be erected without a permit from the Commissioner of Public Buildings and on his approval. No billboard shall exceed 14 feet in height above the ground and there must be an open space of at least 4 feet between the lower edge of the board and the ground. No billboard shall be nearer than 6 feet to any building or the side line of any lot nor nearer than 2 feet to any other billboard, nor shall any such billboard exceed more than 500 square feet in area, nor to approach the building or alley line nearer than 15 feet. Rotten or unsafe billboards are subject to removal.

The opinion says in part:

In this general statement, we might also add that there is but one virtue connected with this entire business, and that is the advertising itself. This is a legitimate and honorable business, if honorably and legitimately conducted, but every other feature and incident thereto have evil tendencies, and should for that reason be strictly regulated and controlled. The signboards and billboards upon which this class of advertisements are displayed are constant menaces to the public safety and welfare of the city; they endanger the public health, promote immorality, constitute hiding places and retreats for criminals and all classes of miscreants. They are also inartistic and unsightly.

The amount of good contained in this class of business is so small in comparison to the great and numerous evils incident thereto that it has caused me to wonder why some of the courts of the country have seen fit to go as far as they have in holding statutes and ordinances of this class void, which were only designed for the suppression of the evils incident thereto and not to the suppression of the business itself. While advertising, as before stated, is a legitimate and honorable business, yet the evils incident to this class of advertising are more numerous and base in character than are those incident to numerous other businesses which are considered *mala in-se*, and which for that reason may not only be regulated and controlled, but which may be entirely suppressed for the public good under the police power of the State. My individual opinion is that this class of advertising as now conducted is not only subject to control and regulation by the police power of the State, but that it might be entirely suppressed by statute, and that, too, without offending against either the State or Federal Constitution.

¹ Adeney (Appendix vi. to Fifth Report of Royal Commission on Sewage Disposal, p. 55), experimented with 20 per cent. mixtures of sewage with both tap- and sea-water under aerobic conditions, and his results in relation to the absorption of dissolved oxygen agree to a considerable extent with those obtained by the authors.

Laboratory and Field Investigations

WHILE we do not often publish in *Municipal Journal* articles extremely technical in their nature, believing that these have more place in text books than in periodicals, the matter of disposal of sewage by dilution in large bodies of water is such an important one at the present time that we have made an exception of a brief paper dealing with this subject which is abstracted in this issue. It will be noticed that these experiments were made with mixtures of sea water and sewage, which mixtures were made and retained in the laboratory. It would seem that this was the only way to be at all certain of just what character of sewage entered into the mixture, and in what proportion; but results from such experiments should not be considered as too closely paralleling those which occur in the actual disposal of sewage by dilution, but only as indicating what is likely to occur under laboratory conditions; the conclusions being modified to allow as far as possible for other affecting conditions which may exist in each particular case. A suggestion of one such condition is given in the concluding paragraph of the paper, where the authors suggest that the green algæ present in water during the summer months may absorb sufficient ammoniacal nitrogen to pre-

vent an accumulation of unoxidized nitrogen in the water and arrest or reduce putrefactive changes by supplying dissolved oxygen. These algæ would, of course, not be present in the laboratory experiments, and thus the latter might indicate actions and resulting conditions considerably different from those which would take place in actual cases under consideration.

There are many other conditions, mostly physical, which might have a very considerable and even a determining effect upon the conditions resulting from discharging sewage into water, among these being the stirring up of the water due to the passage of boats, the vertical currents caused by alternate heat of day and cold of night and by irregularities in the bottom combined with the current of a stream or motion of the tide. The effect of animal life also, as well as of the vegetable life referred to, may be more or less appreciable, especially in the removal of the finer suspended matters.

The laboratory study of chemical and bacteriological changes has its value which we would not deny or minimize, but these should be supplemented by careful observation and study of actual conditions and what effect they may produce. Studies of this kind—such as are being made by the Metropolitan Sewerage Commission of New York, for instance, which were described in our issue of Sept. 14, 1910—are apt to bring about many discoveries which are at first apparently inconsistent not only with laboratory experiments but frequently with each other, but which probably can generally be interpreted to mean, not that either laboratory or field tests are incorrect, but rather that some further affecting conditions must be looked for.

Fire Hydrant Rates—a Correction

IN the article bearing this title in last week's issue, the sentence at the beginning of the second paragraph on page 843 should have read "The authors assume that the average per capita consumption in gallons per day may be taken to be $32\sqrt[5]{\frac{X}{Y}}$ ". A number of copies were printed before it was discovered that the printers, in spite of repeated instructions from the editorial department, had omitted the index figure 5.

Municipal Abattoir in Amsterdam

ONE of the largest and most important municipal utilities of Amsterdam is the city abattoir. It is situated at the eastern end of the harbor, surrounded by canals and docks and connected by branch lines with the local railroad system.

The buildings comprise two slaughtering houses for cattle, a slaughterhouse for hogs, and one for horses; three stables for cattle, and three each for hogs and horses. There are other buildings also, for the treatment of waste and hog's hair, for blood drying, tripe boiling, a forge, the sterilization of meat, a laboratory for the microscopic examination of trichinæ and offices of administration. There is also a space for a cattle market, on which are a café and stables for visitors' horses and vehicles. Once a canning factory was operated, but became unprofitable and was abolished. The total surface occupied by the buildings and cattle market exceeds 100,000 square yards.

All the slaughtering of animals for food in Amsterdam must be done here. Some meat slaughtered elsewhere is brought to the city, but it must be inspected at the city abattoir and be marked with a stamp the same as meat slaughtered there. If any such meat is found unfit for consumption it is converted into fertilizer. Meat not perfect is sometimes made edible by sterilizing and salting.

The slaughtering is not done by the city, but by owners of stock or dealers in meat, who pay for the use of the abattoir 64 cents for each cow, ox, or horse, 34 cents for a hog or a fat calf, and 10 cents each for a young calf, a sheep, or a goat. For examining meat not slaughtered there, the charge is about a fifth of a cent a pound for beef and pork and a tenth of a cent for other meat. The charge for examining a live animal is 56 cents. The meat is taken from the abattoir to the shops in town in specially arranged conveyances.

A report of the abattoir's operations is prepared annually, but that for 1910 is not yet completed. In 1909, the total number of animals slaughtered was 150,530; in 1908 it was 144,025. —*Consul Frank W. Mahin in Consular and Trade Reports.*

CONCRETE METHODS IN ROCHESTER

Further facts and two corrections concerning the description published under the above title in our issue of June 7 and the preceding description in that of May 31st are contained in a recent letter from principal assistant engineer, John F. Skinner of Rochester. He states that the hammer or "monkey" used in the pile driver employed for compacting the clay in the expansion joints between wall blocks weighed 200 pounds and not 20 pounds. Also that in the Central avenue bridge no re-tempering was contemplated for the concrete proper, but only for the mortar used in bonding the new and the old concrete.

Each keyway between blocks is now furnished with flush-handled covers set over the keyway flush with the top of the wall coping and easily removable when it is desired to repack the clay. Mr. Skinner states that he has employed the same plan of keyway and clay packing in several other constructions; namely, between the wall blocks of the swimming pool at one of the Rochester municipal bath houses, where the keyway consisted of an opening 4 in. square, one-half in each block. A similar plan was adopted for a sprinkling filter designed in 1906 in connection with the Sommerville sewerage system, which plant was built in the following year; the method in this case being to form the keyway by inserting a 3-in. wrought iron pipe between the blocks as a form, occasionally turning the pipe during the setting of the concrete so that it could be withdrawn. When the pipe was removed the keyway was packed with clay. The same plan was used in the design for a sprinkling filter system which will probably be constructed this summer. It was also employed in the construction of the water works reservoir at Olean, N. Y., which was designed in 1907.

SMOKE ABATEMENT IN BOSTON

Result of Six Months' Enforcement—New Law Practicable—Simple Standard of Measurement and Co-operation with Plant Owners.

PRONOUNCED progress has been made in the abatement of the smoke nuisance in Boston under the new state law which went into effect July 1 of last year, but which has been actually enforced only for a little more than six months. Owing to complications with the state Civil Service Commission over the selection of a smoke inspector this official, provided for by the new law, was not really in office until the end of last November. Since then, however, he has made more than 1400 smoke inspections, using the Ringelmann charts as a standard; has given instruction in the fireroom to many firemen and engineers; and has brought the smoke output, with one or two exceptions, within the maximum allowed by the law.

The new law has proved perfectly practicable. There has been no difficulty whatever over the enforcement of it. There have been no legal rulings in regard to any of its provisions, simply because no owner of a power plant has felt that there was any use in contesting the law. How little resistance there has been will appear from this fact: The law requires the Board of Gas and Electric Light Commissioners to give a public hearing to any person charged with violating the smoke law before they proceed in the courts to enforce the penalties provided by the law for violation. Not one such hearing has been held. Power plant owners have recognized the necessity, and the prudence, of obeying the law; have realized that they could gain nothing by fighting it; and have, therefore, set themselves energetically to complying with it.

Two main reasons lie behind this wholesome and gratifying unanimity of action on the part of power plant owners. In the first place, the standard of measurement—the Ringelmann

charts—is so simple that the owner's engineer can apply it just as well as the state inspector. The framers of the law studied the experience of other cities, and came to the just conclusion that a good deal of the trouble elsewhere had been due to variable and capricious standards—what the railroad man would call "head rates," peculiar to the inspector who happened to be on the job. When the power plant engineer doesn't know what to expect from the inspector he trusts a good deal to luck in the hope of escaping condemnation. The definite standard of smoke intensity prescribed by the new law is the foundation of its success. The owner doesn't have to wait for the inspector to tell him that he is breaking the law; let him give his engineer a little practice and he will know the whole story, and the requirements, for himself.

Second in importance in getting good results from the law has been the attitude of the state in offering to power plant owners friendly co-operation toward smoke reduction, instead of merely a rigid and stringent enforcement of a severe law. The statute itself makes the standards increasingly severe over a period of three years in order to give power plants ample time to become accustomed to the new standard of smokelessness in operation. Following out this idea the state inspector under the law, while applying the standards of the first year of the statute fully and without favoritism, has done everything in his power to co-operate with the owners and operators of power plants, and to assist them in finding ways to avoid making more smoke than the law allows.

This co-operation between the state inspector and the workers in the power plant has naturally resulted in a much more complete knowledge of what power plant usage commonly is than it would be possible to get in almost any other way. Perhaps the commonest disclosure is that the great majority of firemen do not know how to fire properly, and that the great majority of engineers take no responsibility whatever for the way their furnaces are fired. There is a small proportion of the "don't care" element in each class; but the greatest obstacle has been found to be lack of proper knowledge. More than a few engineers and firemen, for instance, have complained to the state inspector that they did not know the proper way to use the steam jets with which their furnaces were equipped. In such cases, and many other kinds, it has been the task of the inspector to go into the fireroom and teach proper methods. This has often gone further and led to a considerable overhauling of the boiler plant.

In something like twenty-five lumber plants, for instance, the fuel has been wet shavings, fed into the furnaces above the grate in an air-blast. This blast of shavings has been deflected upward by the bridge wall, in most instances, and so chilled by contact with the boiler that much of the incipient combustion went no further than the production of great quantities of brown or yellowish smoke. It was the smoke inspector who discovered that the way to avoid this smoke and to save fuel was to cut down the bridge wall practically to a level with the grate bars. All but one of these lumber plants, burning wet shavings, is now inoffensive within the limits prescribed by the law for the first year of operation.

It is worth while to note, in connection with the smoke from shaving-burning plants, that their smoke involved some nice discretion on the part of the inspector because the wood smoke differs entirely in color from the grays presented by the Ringelmann smoke charts. The law, however, declares that smoke must be tested for its "density," and under this provision the inspector has had to cut away from the natural tendency to test smoke by its relation to the depth of the grays on the charts, and to make his tests depend, instead, on the degree to which he can see through wood smoke. This may sound difficult, but for a technically trained man, like the Massachusetts inspector, it is in no wise difficult. Taken altogether, the Massachusetts smoke law is notable for its entire workableness, and for the fact that it has in six months been applied without serious friction and with decided benefit to the atmospheric conditions in and about Boston.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Use Street Car for Sprinkling

Birmingham, Ala.—The city of Birmingham has accepted a plan of the Birmingham Railway, Light and Power Company to operate an electric street car sprinkler. For thirty days the plan as outlined will be tested, and if at the expiration of that time it is producing the benefits claimed for it the service will be retained. It is planned to operate the car twelve hours per day at a total cost of \$480. Of that amount the city is to pay \$280, while the company will pay the remaining \$200, provide the car, provide the men and work the service twelve hours per day.

Improve Town by Laying Pavements

Williamsport, Md.—The street committee of the Town Council has begun making extensive improvements to the streets of the town, beginning operations on the main block of Conococheague street, which has been macadamized and is now being rolled. A block on Potomac street will next be treated in the same manner and the improvements will be continued throughout the summer at considerable cost.

Street Improvements Blocked for Two Years.

Spokane, Wash.—Practically no more street improvements ordered for two years in Spokane is the proposition the City Commissioners are facing as a result of the new State law which recently went into effect. According to Commissioner Coates nearly every street improvement made by the city costs more than the limit of 50 per cent of assessed valuation set by the new law. He says the new condition means that almost all street improvements except those already initiated by petition or by resolution of the Council will be halted till the Legislature can meet again to correct the mistake in the new law. The clause providing that no improvement costing more than 50 per cent of the assessed valuation of property is the result of a mistake made by a recording clerk at Olympia.

Want County Money for City Streets

Lexington, Ky.—Believing that the five magisterial districts included in the city of Lexington are entitled under the Kentucky statutes, section 1888, to their pro rata of the fund apportioned annually by the County Fiscal Court for the maintenance of the roads of the county, which would aggregate from \$30,000 to \$50,000 annually on the basis of the county apportionment, Mayor Skain has brought the matter officially to the attention of the General Council and that body has directed the City Solicitor to make an investigation of the city's claim, which, if sustained, will mean that this amount will be available for repairs and maintenance of the streets of Lexington.

Ten Miles of New Sidewalks Put Down

Tampa, Fla.—Tampa is enjoying a great boom in sidewalk construction, which is going on with leaps and bounds. Never before in the history of the city has so much work of this kind been in progress, and judging by the many permits which have been issued by the Board of Public Works in the past few days the work will go merrily on for months to come. It can be noted that sidewalks are being laid in all sections of the city, in the new territory as well as the downtown section.

Officials Visit Neighboring City to Inspect Pavements

Newark, N. J.—Board of Works Commissioners Mungle, O'Connell and Kraemer and Assistant City Engineer Halleck recently made a trip to Boston, Mass. They went to inspect the bitulithic pavements laid on the streets in that city. Some of these pavements have been down several years, and the Newark officials were desirous of ascertaining, by inspection, their capacity to withstand the wear and tear of heavy traffic and general use.

SEWERAGE AND SANITATION

Mason City Has Problem

Mason City, Ia.—Mason City must spend thousands of dollars in securing expert engineers and putting in and rearranging the sewage outlet east of the city limits. This was announced by Mayor Norris, who has quietly been making an investigation of conditions. For years the sewage has been emptied into Lime River, two miles below the city. Low water the past few years has allowed a great quantity of matter to collect, which has practically choked the channel of the stream, has polluted the water and caused trouble and disease. The president of the State Board of Health ventured the opinion that the epidemic of infantile paralysis may have been caused by the condition.

Abatement of Mosquito Nuisance Due to Oiling Streets

New Haven, Conn.—The annual "mosquito census" of the New Haven Board of Health shows that the number of the pests is steadily decreasing. The present plan of oiling the city streets is held largely responsible. Oil from the streets is washed into the sewers, whence it finds its way into the harbor and eventually is deposited by the tides upon the marshes where the mosquitos breed.

Fumigation Regulation

Wilmington, Del.—The Board of Health has adopted a new regulation which provides that houses in which deaths from tuberculosis have occurred must be fumigated. Heretofore it has been the custom to fumigate in such cases, but there was no law making it obligatory, and in some instances the occupants of the house refused to allow the health officers to make the fumigation. Under the new regulations, as soon as a death from tuberculosis is reported to the Board of Health an executive officer will be dispatched to the house and immediately fumigate it.

Appoint Sanitary Inspectors to Improve Conditions

Dallas, Tex.—Upon nomination by the Board of Health, five sanitary inspectors for work in the City of Dallas have been appointed by the Board of Municipal Commissioners. Their work is to be under the general direction of the Board of Health, more directly under the supervision of the city health officer. These men are to make inspections in all parts of the city, looking after any infraction of the sanitary regulations in the city, the failure to make sanitary sewer connections, the accumulations of trash or refuse or dangerous matter in alleys or about premises and the securing of evidence for cases filed in court.

Improved Sanitation of Stables Required.

Spokane, Wash.—An order for housecleaning of livery stables, affecting from 25 to 30 establishments, has been sent out by Health Officer J. B. Anderson, with the result that two big downtown stables, unable to comply with the department orders, must seek new locations. Cement floors with proper drainage, whitewashed walls and connection with a city sewer were the requirements demanded by the Health Department, with the authorization of Mayor Hindley, of over 25 stables, as a result of a recent thorough inspection of this class of business in Spokane.

Abate Nuisance of Smoking Chimneys

Salt Lake City, Utah.—Holding the smoke nuisance to be vital in the civic improvement problem the sanitation committee of the Commercial Club has decided to wage a war of extermination against the smoking chimneys of the city, and authorized the chairman to appoint a subcommittee of five to find out why the city ordinances on the subject are so repeatedly violated. A hotel proprietor told the committee that he had installed a smoke consumer that not only solved his smoke problem but had saved him \$156 in coal bills during the first two months.

WATER SUPPLY

Water Plant Out of Debt

Kenosha, Wis.—The last cent of indebtedness on the Kenosha water plant has been paid and the trust deed, which had been given by the city in 1895, to insure the payment of the bonded indebtedness of the municipal plant, was discharged. The plant is now entirely free from debt and has a balance of \$20,000 in the bank. The original bond issue amounted to \$140,000, and in addition to paying off all of the bonds the value of the plant has been more than quadrupled in the fifteen years. It is declared that the water plant in Kenosha is the most successfully operated municipal plant in the United States.

Watershed May be Purchased

Waterbury, Conn.—Members of the Board of Works are giving consideration to the acquisition of a considerable watershed in Prospect, where it is the ultimate intention of the city officials having the matter in charge to locate a reserve reservoir, which shall prove auxiliary to the East Mountain and Prospect reservoirs, should it seem best to the Board of Aldermen. These now furnish the main source of the water supply of the high service section of the city. The capacity of the proposed reservoir is said to be double that of the East Mountain supply, which at its best is nothing to boast of, and the water is of the best quality. Should this watershed be secured at a moderate price it could be kept in reserve and utilized when the city needs it. If it should be secured by another city that section would never be available for Waterbury, however great the need. It is probable that the purchase will be considered at an early date by the Board of Works.

Geyser in the Street

Buffalo, N. Y.—A 12-inch water main burst one day last week at Seneca and Chicago streets. The trouble was first evident when the pavement was disrupted and the water began to well into the street. As it gathered headway the asphalt was torn apart and the cobbles of the stone pavement were washed out. The alarm was telephoned to the Water Bureau and two repair wagons were sent to the scene with a crew of men. The workmen on the first wagon sized up the seriousness of the break immediately and telephoned the Water Bureau and the whole available force of repair men were ordered on the job. The repairing job was by no means an easy task. The men have encountered worse breaks, but never one in so difficult a position. The broken pipe is about seventeen years old. Foreman Taughran said: "You can never tell about water pipe. Sometimes the best casting will burst in a year, while pipe that an expert would class as poor quality will last for years and years."

Propose Fine for Water Wasters

Denison, Tex.—At a meeting of the City Council last week City Attorney Decker was ordered to draw an ordinance providing for a fine of not more than \$100 to be assessed against any water user convicted of willfully wasting water. Superintendent Berry, of the Water Department, reported to the Council that he had reason to believe that some water consumers were sprinkling lawns and otherwise using water in a manner not justified by the existing state of the water supply. Hence the ordinance referred to above.

Water Waste Survey Is Started

Milwaukee, Wis.—An investigation of water waste, involving a study of the efficiency of operation of the Water Works Department, was begun by Consulting Engineers Ray Palmer and W. R. Brown. The investigation is under the direction of the Bureau of Economy and Efficiency, on request of the Commissioner of Public Works. It will probably take the entire summer, and the cost will be met from a fund of \$5,000 set aside by the Council. Ray Palmer, who is in charge, will take up as his particular lines the plant efficiency and electrolysis surveys. He is consulting engineer for some of the largest manufacturing concerns in Chicago and has had extensive experience in electrolysis work. W. R. Brown, who has direct charge of the water wastes survey, is a division engineer of Chicago, where he conducted a successful water wastes survey.

Reservoir Chemically Cleaned to Receive Filtered Water

Cohoes, N. Y.—Reservoir No. 2, of the Cohoes water supply system, has been completely drained in order that the basin may be cleaned. The walls and bed of the reservoir will be subjected to chemical treatment and later the large lake will be made the storage basin for the filtered water which will be sent through the mains to the lower or eastern section of the city. The big standpipe at the new filtering plant will hold the water for the consumers of the hill district.

Rush Work on Wells; Will Soon Be Ready

Fort Worth, Tex.—When deep wells now being drilled and others planned are completed the city's daily supply of artesian water will be increased at least 2,000,000 gallons. Two deep wells with a capacity of 500 gallons a minute have been sunk 1,100 feet through stone and dirt to the Trinity water-bearing sands. These new deep wells are located on the Cobb tract, near the Cobb Brick Works. In the same vicinity a new shallow well is being sunk to a strata known in the geological survey of the county as the Paluxy sands. Five hundred feet of boring will be necessary to strike water for the shallow well. "These two new deep wells and the shallow well should be playing a part in the daily water supply by the first of next month," said Water Commissioner Powell last week. "The work of assembling a plant is now under way and barring breakdowns or unlooked-for accidents it will be working in about two weeks. It is our intention to sink three additional deep wells to the Trinity sands for artesian water. When that is done the daily supply should be increased by more than 2,000,000 gallons. That, at least, is the extra yield upon which we are now figuring. I am unable to say when the mains of the city will be entirely free of river water, but I hope such a condition will prevail within two weeks, and feel safe in saying that the mains will carry nothing but artesian water by July 1."

STREET LIGHTING AND POWER

Favor Licenses for Electricians

Madison, Wis.—The Senate has passed a bill authorizing the city of Milwaukee to license persons, firms and corporations engaged in the installing of wires for electric lights and power in buildings, the annual license fee to be from \$25 to \$50. The Senate also passed a bill prohibiting the wiring of buildings for electric light and power in Milwaukee without a permit from the City Building Inspector.

City Gets \$3,425 as Lighting Rebates

Woonsocket, R. I.—Chairman Charles H. Cabana and his associates on the joint standing committee on street lights are being warmly and justly complimented and congratulated by taxpayers and city officials because of the advantageous settlement that they secured of this city's claim for alleged poor lighting during an experimental period of eighteen months ending in May of last year, when the present lights were substituted for the ones that the Woonsocket Electric Light and Power Company had been operating here after the arc lights had been discarded. The committee and Alfred W. Townsend, the lighting company's general manager, terminated the series of conferences that they had been holding by making an agreement whereby the company will pay the city \$3,425, and cancel about \$800 in bills upon receiving from the city a properly executed release of all claims because of alleged poor lighting under consideration.

Will Employ Expert to Determine Use of Conduits

Los Angeles, Cal.—In order to determine the city's policy with respect to the occupation of the streets with manholes and other underground chambers by the utility corporations, the Board of Public Works will ask the City Council to appropriate a sum sufficient to engage K. B. Miller, an expert engineer from Chicago, to outline a plan to be followed. Mr. Miller has been assisting the Board of Public Utilities in gathering data on which to fix the telephone rates. He is especially conversant with telephone work, and as the principal difficulty at present is with the phone companies, the Board believes he would be an excellent man for the job.

Cluster System May Be Ready Before Winter

Columbus, O.—With 400 candlepower to a standard and 4,000 to a block, the cluster lighting system, which is soon to be installed on several of the principal streets of Columbus, will give 25 per cent better light than is now afforded by the clusters on Main street, and 250 per cent more than that which emanates from the present system of arches, say its promoters. The lamps to be used on a standard will number five each, with 80 candlepower to each 100-watt tungsten globe. This makes 100 more candlepower to a standard than the system now in vogue in the Hub district, and will increase by 2,400 candlepower the light of every block on High street under the present system of illumination. There will be 860 such standards in use under the present plan of the system, according to a statement made by Service Director Harry S. Holton. Work on the installation of the clusters ought to begin, he added, by August 15, if no unusual delays are encountered.

Start Municipal Plant

Porterville, Cal.—Work was started on probably the first co-operative electric power plant in California, when ground was broken for the raceway of the plant for the Tulare Power Company on the upper Tule River. This plant is financed by the dairymen and orange growers, who are power users. C. H. Holley is in charge of the construction work and water rights sufficient to develop 7,500 electric horsepower have been located.

Town Celebrates Installation of Cluster Lights

Hamilton, O.—The inauguration of the cluster electric lighting system in the business center of the city last week was a brilliant success and marks a material advancement in the city's progress. The movement was started some time ago, was supported by the Chamber of Commerce and City Council and met with the co-operation of the Retail Merchants' Association, which took an active interest in the matter and carried it through to a final and successful consummation. Much credit for the opening of the cluster light system in Hamilton must be given to Superintendent James O'Toole, of the Municipal Electric Light Plant. Mr. O'Toole personally took charge of the work of installing the new system.

Company Offers Lower Rate to Stop Municipal Plant

North Yakima, Wash.—Rates for electric light which it is willing to offer the people of North Yakima have been announced by the Pacific Light and Power Company. The reduction is to 12 cents a kilowatt hour for small consumers and 8 cents for large consumers. The officers state that next year the rate would be cut down to 11 cents and in 1913 to 10 cents. On their part, however, the officers of the power company want the city to abandon its plan of a municipal lighting plant. After a meeting lasting two hours and a half, in which city officials and business men expressed their opinion, the Pacific Light and Power Company was asked to submit its proposition in writing and a further meeting between its officials and the City Council was arranged. President Guy W. Talbot, Vice-President A. S. Grenier and other officials of the company were here from Portland for the meeting. Mayor Schott some weeks ago filed on a water right in the Yakima River for the city and the City Engineer was instructed to make estimates of the cost of a water and light plant. It was hoped that the power company would give a 10-cent rate here, in which event the municipal plant idea would have been postponed, since the city is anxious to bond itself for a trunk sewer which will cost some \$200,000 or more.

Improve City by Removing Poles

Portland, Ind.—Superintendent B. W. Sissell, of the Portland light plant, and his men are now engaged in taking from the streets throughout the entire west part of the city the electric light poles and wires and transferring them to the alleys. The work is being pushed as rapidly as possible without interference with the service. It is said that aside from improving the appearance of the street, the change will benefit the service in removing the wires to a great extent from possible contact with others belonging to the telephone company.

FIRE AND POLICE

Pleased with the New Police Signal System

Buffalo, N. Y.—Mayor Fuhrmann, Commissioner Zeller, Superintendent Regan and other city officials witnessed a test of the new police signal system installed at the Pearl street station. The inventor explained the working of the new system. The feature is that it keeps the station house and the patrolmen on the beat in close touch at all times. A call was sent out to one of the signal boxes at Clinton and Oak streets. Ten seconds after the bell sounded a policeman on that beat was in communication with the desk sergeant at the station house. Mayor Fuhrmann and Commissioner Zeller expressed themselves as well pleased with the working of the new system.

Motor Cycles for Patrol Duty

Lynn, Mass.—The motor cycles which will be used for patrolling the outskirts of the city, especially in East Lynn and West Lynn, have been purchased for the Police Department by Purchasing Agent Carleton. The cycles are two-cylinder, five-horsepower and will be put in commission next week, when Mayor Connery and Chief Burckes decide which officers shall operate them.

Officials Visit Neighboring City to Inspect Apparatus

Lawrence, Mass.—Mayor Edward Smith, City Clerk Arthur Phinney, Fire Chief Lane and Aldermen Morgan, Clough and Barry, of Manchester, N. H., visited the city one day last week en route to Boston while on a tour of inspection to look over some ladder trucks which the Manchester department intends to buy. The "Queen City" delegation of city officials arrived in Lawrence shortly after 9 o'clock a. m., and went to the central fire station on Lowell street, being accompanied by City Clerk E. J. Wade, of this city. Fire Chief Carey joined the party and directed the visiting city fathers to the Franklin street engine house, where a ladder truck similar to the one wanted by the city of Manchester was viewed. The out-of-town party then continued on its journey to Boston in an automobile.

GOVERNMENT AND FINANCE

Mayor Cuts Own Salary

Springfield, O.—Taxation affairs, which have caused no end of discussion in Ohio city governments for the last few months, owing to the passage of the Smith 1 per cent tax law, have come to a climax in Springfield with the announcement by Mayor C. J. Bowlus that he has cut his salary almost in half in order to have this city proceed with the many public improvements planned here. Mayor Bowlus has been receiving \$2,500 a year, but now announces that he has decided that \$1,500 will be enough for him to live on. He also makes the statement that he does not expect to be the only official here who will chop his salary. This announcement has caused an alarm among the county officials, all of whom say they will not cut their salaries even though the Mayor should choose to cut his out altogether. Mayor Bowlus has called a meeting at which this question will be talked over in plain words. He says the officials must cut their salaries at least one-third.

Municipal Tangle in Oklahoma City Settled by Court

Oklahoma City, Okla.—The commission form of government adopted by Oklahoma City is constitutional and the election under the laws of the State was properly held, was the substance of the decision of the Supreme Court, acting on the Oklahoma City charter. That the people have an inherent right to form whatever form of government they desire as long as it is not in conflict with the Federal Constitution, was the holding of the higher court. With the announcement of the stand taken by the Supreme Court, old officials at the City Hall, who have fought the new charter form since others than they were elected to the offices, gave way to the new regime and announced they were ready to abide by the decision of the court. The first thing Mayor Whit M. Grant did after taking his office was to sign salary warrants totaling more than \$8,000. These had accumulated.

Women to Have Vote on Buying Water Plant

Des Moines, Ia.—The question of the right of women to vote on the proposition of the purchase of the water works by the city has been raised. The best authority is that the women have the right to vote on the question. Asked by newspaper men whether the women could vote at the special election June 19, when this question will be decided, Special Counsel Lees, of Attorney General Cosson's office, said he thought they could. Section 1131 of the code of 1907 provides:

The right of any citizen to vote at any city, town or school election on the question of issuing bonds for municipal or school purposes and for the purpose of borrowing money or on the question of increasing the tax levy, shall not be denied or abridged on account of sex.

It is the belief of Mr. Lees and others who were consulted that this section of the code enables the women of Des Moines to vote on the question. The law above quoted was passed by the Twenty-fifth General Assembly.

Proposes Northwest Civic League

Tacoma, Wash.—The formation of a Northwest Civic Improvement Association was proposed by Mayor Seymour at an informal gathering of Mayors of various Northwestern cities, held at the Rainier Club at Seattle one evening last week. The meeting of Mayors was due to the action of Mayor Seymour, who conceived the idea of discussing with the heads of other cities various municipal problems. Behind the meeting, however, is the larger civic project, which Mayor Seymour said he expected to see developed at a second meeting of the Mayors next Fall. A civic association as contemplated by the Mayor embraces all the cities of the State and Northwest, including Victoria and Vancouver, B. C. Its chief object, he explained, is the holding of annual conventions of several days' duration for the discussion of problems affecting the welfare of cities. Besides the officials of various cities included as members, anybody interested in the advancement and solution of the problems of cities will be eligible to membership.

Transfer City Funds

Tacoma, Wash.—Formal transfer of \$128,989.70 from the various city funds to the light and water fund in payment of old light and water bills was made by the City Treasurer during May by Commissioner Freeland of the Department of Finance. The Light and Water Department, however, had to refund to the general fund \$110,583.26, the amount representing the interest the city has paid on bonds of the department, as follows: Gravity water system bonds, \$99,125; power plant bonds, \$11,458.26. The interest for the water bonds covered the period between May, 1910, and May, 1911, while the other interest included the period from June, 1910, to April, 1911. During the year ending May 1, 1911, the city used \$56,500 worth of water and \$72,399.70 worth of light, but until last month the Light and Water Department had never been credited with those sales to the city.

Atlanta Wants a Commission

Atlanta, Ga.—Steps toward establishment of a commission form of government for Atlanta were taken recently when at a meeting of citizens it was decided to petition the Legislature to pass laws necessary to hold an election on the question. The Legislature will convene this month. It was declared at the meeting that the desire for a change in municipal administration was not due to any actions of city officials, but to the so-called obsolete city charter.

Bayonne Votes "No" on Commission Rule

Bayonne, N. J.—The attempt to end the present form of government of Bayonne, N. J., and substitute therefor government by commission, under the act passed by the last Legislature at the behest of Governor Wilson, failed after a spirited election last week by just two votes. There were 2,234 votes cast in favor of the plan to 2,236 against it. In the Fourth District of the First Ward the Election Board threw out two ballots because they were marked wrongly. No one knew if these two votes were for or against the reform method of government. The Hudson County Board of Elections will hold an official count in about two weeks, and if the two rejected ballots are counted for the commission plan the election will have resulted in a tie. In this event another election will probably be held

STREET CLEANING AND REFUSE DISPOSAL

Municipal Garbage Collection

Duluth, Minn.—For some time the city has been experimenting with municipal garbage collection. The experiment has demonstrated these essential facts: That city garbage collection is cleaner and better and more thorough than private garbage collection; that it gives the city a better chance to see to it that all garbage is properly cared for; that the city can do it as cheap as, if not cheaper than, individuals, as well as better, and that it can be done not only without cost to the city, but actually at a profit. The one garbage wagon operated by the city in the downtown district has not only paid its way, but in one year has practically repaid the original cost of horse and wagon out of profits.

Cost \$895.20 for Municipal Clean-Up

Eric, Pa.—Superintendent of Streets John O'Hagan reported to Mayor Liebel last week that the cost of cleaning up the rubbish on municipal cleaning day was \$895.20. The work took four days with every available team working. The average cost per load was 92 cents for 974 loads. The Mayor has figured out that by the city doing the work the property owners were saved at least \$5,000 from what they would have had to pay draymen. Money for the team work comes from the ward funds by appropriation of councils.

Praises City Cleaning

Toledo, O.—Recognizing the beneficial results of the civic housecleaning conducted May 1 by the Civic Federation of the Commerce Club, Service Director John R. Cowell has communicated with the officers of the federation confirming the report that the city has decided to maintain a daily clean-up and requesting the federation's moral support.

RAPID TRANSIT

Municipal Railroad to Coyote Point Favored

San Mateo, Cal.—A movement was started at a meeting of the San Mateo board of trustees for a municipally owned railroad from San Mateo to Coyote Point, on San Francisco Bay, about a mile and a half from the center of San Francisco. It is also planned to construct a municipal wharf for the purpose of establishing a ferry service between San Francisco and San Mateo. Davenport Bromfield was asked to estimate the cost of the wharf and railroad.

Special Street Car Committee Submits Report

Jacksonville, Fla.—After practically three months of patient waiting the special committee from the City Council and citizens at large, appointed to investigate and make certain recommendations regarding the street railway service in this city, presented its report at a meeting of the City Council last week, said report digging deeply into defects alleged to be existing at present and making preparations to avoid any defects which might exist in the future. The report was quite exhaustive, embracing an entire library of manuscript, and recommending everything that could be imagined to make a street railway system absolutely ideal. Following the reading of the report various members of the council made brief talks and a full discussion of the committee's findings was indulged in. Many motions in regard to the disposition of the report were made, all of which were killed finally and a further motion, offered by Councilman Holt, providing for the publication of the report in the daily papers, and an additional supply of 300 copies for distribution from the office of the city recorder, prevailed.

New Street Car Line Rumor

Denison, Tex.—While the plans or the names of the people interested have not been made public there is a well-defined movement on foot to build a second street railway in the city, according to a prominent citizen who declined to allow his name to be used in connection with the reports. According to his statements capitalists from Ohio have made two trips of inspection over the city of Denison. The streets and avenues of the city have been gone over as late as last week by men who represent ample capital and who have made the construction and maintenance of street and interurban railways their specialty.

MISCELLANEOUS

Plan Deeper Channel for Providence River

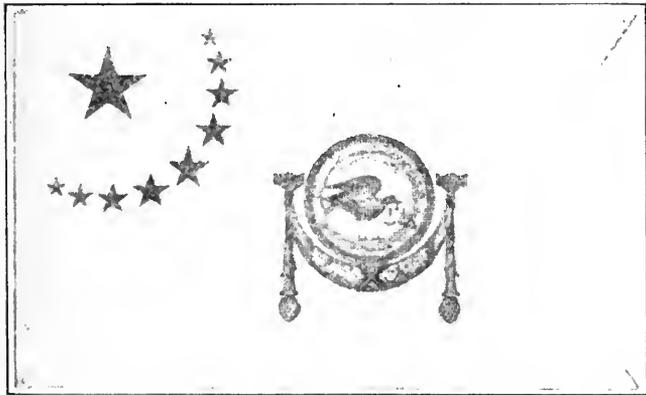

Providence, R. I.—Proposition of a 30-foot channel for Providence River and Narragansett Bay is a matter of much consideration at the present time, Representative George H. Utter having had frequent consultations with the officials of the War Department for the purpose of hastening the report on the examination and survey of Providence River and Harbor. Mr. Utter is very desirous of having the examination and survey completed as soon as possible so that the report may be considered by Congress at once. Mr. Utter has sent a communication to the United States Engineer at Newport, who is in charge of this survey, asking for information as to the exact scope the examination and survey is taking, with a view of introducing a resolution in Congress asking for additional authorization if it is found necessary.

City Plan Commission Is Called Together

Newark, N. J.—At the suggestion of City Clerk Connelly, David Grotta, whose name headed the list of nine appointed to the city plan commission by Mayor Haussling last week, has issued a call for a meeting of the commission. At that time the members will be sworn in and will effect organization. Under the bill creating the commission, which was passed by the last Legislature, it will have power to employ experts to confer as to methods of beautifying the city and developing the community along a general scheme that will bring out all that is best in the city's improvement. The sum of \$10,000 is allowed to the commissioners to spend in a single year, they themselves serving without compensation.

City Adopts Municipal Flag

Indianapolis, Ind.—A municipal pennant has been adopted by the Municipal Flag Commission, recently appointed by Mayor Shank, and the pennant has been approved by the Mayor, and will become the official emblem of the city of Indianapolis. Hereafter Old Glory will share honors with the city's emblem in front of the City Hall Building. The new pennant also will be used in demonstrations by the city and by civic and commercial bodies. The new pennant, which was designed by Dr. William H. Johnson, of the City Council, has a blue field, and, as indicated in the ac-

companioning illustration, in the upper left-hand corner is a large, five-pointed star, representing the executive department. Around the large star, in crescent shape, are nine smaller stars, representing the City Council, which is composed of nine members. At the right hand is the city's seal, representing the legal department and below the seal is a conventional wreath. The stars, seal and wreath are in gold. It is likely the new pennant will be seen in public the first time the Fourth of July, when the emblem will appear in the parade of school children that is being arranged by the Commercial Club.

Appoint Charities Commission to Stop Street Begging

Spokane, Wash.—Arrest and fine or imprisonment will be the lot of any person soliciting funds for charitable purposes without a certificate from Mayor Hindley's charities commission, according to the Mayor's preliminary draft of his proposed ordinance which is now in the hands of the

city legal department to be put in formal shape for submission to the council. The legal department has been instructed to shape the bill to provide for a commission of six members to serve without pay, two members to be appointed with the approval of the City Council every year. The ordinance will provide for an appropriation of \$1,800 for the salary of a permanent secretary and office expenses. "It is now against the law for an individual to solicit funds for himself, which is begging," says the Mayor. "If the measure passes soliciting or begging for others will also be unlawful unless the commission has passed on the worthiness of the cause being solicited for. While the ordinance provides only for the certification plan the commission will be allowed to draw up its own rules and regulations and there is nothing to prevent it from doing charity work itself, supervising the charities of the city and conducting such investigation as it may see fit."

Advertisements on Sprinkling Carts

Ottawa, Can.—That its water carts should spread information as well as water is an idea that has appealed to Ottawa. That city's waterworks committee heard Commissioner Baker of the publicity bureau state the advantages of placing advertising on the water carts, and it was decided to recommend that the idea be adopted, so far as two of the carts are concerned. The wording suggested was as follows: "You are in the chief power city of Canada. Get maps and all information at the publicity and industrial bureau."

Up-to-Date Apparatus Meets Approval of Expert

Dallas, Tex.—The interest in playgrounds for children received a stimulus in the visit of Dr. Henry S. Curtis, who visited Dallas to conduct an educational campaign in behalf of the local playground movement. The value of playgrounds as a means for the proper physical development of the child and the conservation of its health was the general theme of one of his talks. Dr. Curtis stated that when the playgrounds were first started the general thought in the

Courtesy Dallas News.

ENJOYING THE FLYING RINGS

minds of the people was that the purpose of the playground was to keep the children off the streets. To-day they have come to see that the playground has a specific training to give, which is no less definite and perhaps no less important than the training of the school itself. The child to-day gets practically all of his physical strength from his play. Fifty years ago he was getting strong from the work he did, but to-day the work of the city boys has disappeared. Dr. Curtis inspected the playgrounds, which are in full operation, and was much pleased with the up-to-date apparatus.

To Study Chicago Parks

Indianapolis, Ind.—A number of city officials will go to Chicago to study the park and boulevard system of that city. Those who will make the trip are Mayor Shank, Dr. Henry Jameson, John J. Appel and Charles E. Coffin, of the board of park commissioners; Elmer W. Stout, attorney, and Daniel Deupree, engineer for the board; all the members of the City Council except Frank E. McCarthy; Herman Munk, of the board's real estate advisory committee, and Henry W. Klausmann, city engineer; George E. Kessler, the park board's landscape architect, will join the party in Chicago. Expenses of the trip will be borne by individual members of the park board.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Change of Grade—Damages

City of Rawlins vs. Murphy et al.—In an action against a city for damages to abutting property caused by changing the grade of two streets on a finding that one of the streets was not a public highway, it was not error to segregate the damages, and allow recovery on account of the other street.—Supreme Court of Wyoming, 115 P. R., 436.

Negligence of Subcontractor—Liability of City

McNamara vs. City of New York et al.—Defendant city contracted for the construction of a viaduct, and the contractor subcontracted the steel construction work. Plaintiff was injured while walking under the viaduct, while the steel work was being painted by the subcontractor, by an employee letting a piece of plank used as a scaffold in painting fall upon him. Held that, since the work of painting was not inherently dangerous, the city was not liable for the injuries which were caused by the negligence of the subcontractor's workman, either under the doctrine of respondent superior or otherwise.—Supreme Court of New York, 129 N. Y. S. 230.

Defective Sidewalks—Ice

Barker vs. City of Jefferson.—A city permitting snow and ice frozen together to form in ridge across a walk so as to be dangerous to pedestrians and to remain long enough for it to know of the conditions and remove the danger, is liable for injuries to a pedestrian caused thereby. A city must keep its streets reasonably safe for travel; and the fact that it cannot enforce penalties against abutting owners failing to remove dangerous obstructions to travel does not absolve it from the performance of its duty.—Kansas City (Mo.) Court of Appeals, 137 S. W. R., 10.

Police Judges—Salaries—Statutory Provisions

Holman vs. City of Macon.—Revised Statutes provides for the election of police judges. A section empowers the city council to fix the compensation of all officers of the city. A city passed an ordinance that, in addition to the fees allowed by law to the city officers, a salary of \$240 per annum should be paid to the police judge from the common or other fund as may be provided for that purpose. Other ordinances relate to the assessment, collection and disposition of the police court fees, and provide that all fees, costs and fines in proceedings had in such court should be collected by the Marshal, and paid to the police judge's court fund of the city treasury. Held, that the ordinances give no other compensation to the police judge than the salary provided.—Kansas City (Mo.) Court of Appeals, 137 S. W. R., 15.

Invalid Franchise

Monett Electric Light, Power & Ice Company vs. Incorporated City of Monett, Mo., et al.—A city having power to grant an exclusive franchise to an electric light company for a term of years undertook to do so by an ordinance which was void because not passed in conformity to law. The grantee accepted the ordinance, built a plant, and furnished light and power to the city and its inhabitants for the greater part of the term, receiving payment therefor. Held, that the fact that the contract had been performed for such length of time did not render it valid nor give the company the right to enforce it in equity for the remainder of the term.—United States Circuit Court, 186 F. R., 358.

Acquisition of Highway—Abandonment

Valentine Blatz Brewing Company vs. City of Milwaukee et al.—Where a highway is laid out by a municipality or by dedication, and the municipality for more than twenty years opens and uses a strip of land of the same width as such highway, which strip by mistake does not coincide with the lines of the highway laid out, the city acquires the right to use that particular strip for its highway, and abandons the part of the laid out way not included within the strip actually used.—Supreme Court of Wisconsin, 131 N. W. R., 416.

Personal Injuries—Contributory Negligence

Mastin v. City of New York.—Plaintiff, a photographer, who while standing on the curb of a street covered his head with a focusing cloth, and remained thus blinded for five minutes, when he was struck by defendant city's ash cart, was as a matter of law guilty of contributory negligence.—Court of Appeals of New York, 94 N. E. R., 611.

Changing Grade of Street—Liability

Dickerson v. Town of Okolona.—Constitution declares that private property shall not be taken or damaged for public use without just compensation therefor. Kirby's Digest provides that, where a municipal corporation shall be liable for damages to the owner of grounds by the grading of streets, the damages shall be assessed by three disinterested freeholders of the city. A section provides that if a person shall neglect or refuse to accept the amount so assessed, and shall prosecute the municipality and not recover more than the amount allowed by the assessors, he shall pay all costs, and that no claimant for damages shall bring suit until he shall have filed a claim for greater damages with the city clerk within a certain time, and that no suit shall be commenced until after the assessors shall have been appointed and made return of their assessment as provided, nor for 30 days thereafter. Held, that the owner of abutting property may recover from a city for damages thereto from raising or lowering the grade of a street where the damages are direct and peculiar to such property, and not such as are shared by the general public, and the remedy prescribed by the statute is not exclusive, but suit may be brought for such damages where the municipality fails and neglects to appoint an arbitrator as required by the statute.—Supreme Court of Arkansas, 135 S. W. R., 83.

Change of Grade of Street—Damages

Milwaukee Trust Company vs. City of Milwaukee.—Milwaukee city charter entitles the owner of land affected or injured by the alteration of the grade of a street theretofore graded to the former established grade to compensation, and provides that such damages and the costs of improvements as provided and the changing of the grade of any street shall be considered and allowed in assessing benefits and damages because of the street improvement, and, if the damages exceed the benefits, the excess shall be paid out of ward funds unless waived, and a section provides for appeal to the Circuit Court from such assessment as confirmed by the Common Council. Held, that the city is liable to an abutting owner for the damages in excess of benefits resulting from an alteration of grade; the same being recoverable on appeal to the Circuit Court in an improvement proceeding.—Supreme Court of Wisconsin, 131 N. W. R., 439.

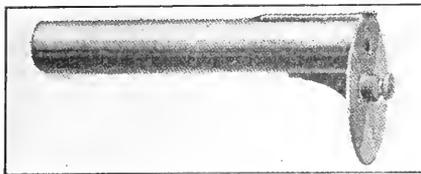

Illegal Expenditures—Recovery

Village of Reed City vs. Reed City Veneer & Panel Works.—The complaint alleged that certain persons, representing themselves as the finance committee of the plaintiff village, executed a contract with defendant, by which the village agreed to purchase property and erect buildings costing \$10,000, and convey it to defendant in consideration of its operating certain manufacturing works therein, employing a certain number of laborers, that the purpose of the contract was to give defendant a \$10,000 bonus without consideration, and that the village purchased realty with village funds for \$4,000 and advanced \$6,000 for erecting a building; that the building was used for manufacturing purposes until destroyed by fire, and a draft representing the proceeds of an insurance policy, payable to the village as its interest might appear, was delivered to defendant and deposited in bank for a certificate of deposit payable to defendant and the village, and the prayer was that the validity of the contract, complainant's rights to the machinery, buildings, etc., and to the proceeds of the policy be determined, and that defendant be required to indorse the certificate of deposit to complainant and pay the difference between it and the \$6,000 advanced. Held, that the complaint was framed on the theory of pursuing and recovering money unlawfully taken from the village treasury and traced into the realty described and the bank deposit, and not to enforce the invalid contract, and was not demurrable.—Supreme Court of Michigan, 131 N. W. R., 385.

MUNICIPAL APPLIANCES

Smoke Meter

THE Kunze smoke meter, invented by Edward J. Kunze, East Lansing, Mich., shown in the illustration, consists of a metal tube 6 inches long and one inch in diameter, at the end of which is a disc of transparent celluloid. Four tints are employed—grades 1, 2, 3 and 4 of the Ringelmann chart. Grades 0 and 5 are omitted, as anything lighter than 1 may be regarded as zero and anything darker than 5 may be called black, without any appreciable error so far as the work of a smoke inspector, for whose use the instrument is intended, is concerned. Grades 3 and 4 are most vital, as they constitute a violation of most municipal smoke ordinances. In the center of the tints as shown on the disk are small holes.

KUNZE DEVICE FOR COMPARING DENSITY OF SMOKE.

The observer looks through the instrument with one eye closed. The smoke is seen through the small hole in the center of the colored spot on the disk and an exact comparison can be made with the color of the spot as there is no disturbing influence. In operation the disk is revolved until the shade of the smoke corresponds to one of the tints on the disk, or most nearly to it. If the smoke is darker than the surrounding tint a dark spot will appear in the center. If the smoke is lighter, the spot will appear quite light in comparison. The contrast is great until the shades correspond to one another, at which time the contrast suddenly ceases to exist and the tint at the end of the tube is unbroken.

The disks are best tinted by photography, but they may be painted. Spots are painted on cardboard corresponding to the desired tints. This is then photographed and printed on a sensitized celluloid disk. By using an electric light for printing uniform grades can be secured for any number of prints. The celluloid disk may be further protected by a glass disk, its edge being protected by a rim of celluloid.

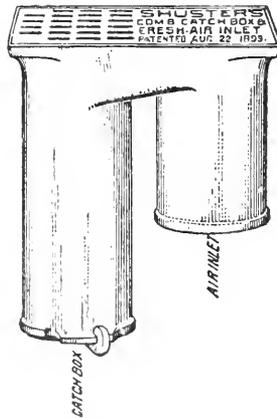

Chlorination Plant for the Disinfection of Water Supplies

The New Jersey Security Company, Paterson, N. J., has placed on the market a plant for mixing calcium hypochlorite with drinking water. The outfit, which was planned by Dr. Leal, may be used either as an emergency plant, its capacity being sufficient for any purpose, or it may be used as a permanent installation. The plant works most conveniently in treating 10,000,000 gallons of water a day, but of course may be used to treat less as well as more. An upright steam engine requiring little floor space is furnished to turn the paddles in the large tanks and operate the device for feeding the chemical. The tanks are of steel and may be lined with a noncorrosive coat-

ing if required. There are two porcelain lined orifice regulating boxes. The depth of the solution is regulated by a flat valve and the orifice is protected by a screen. The regulated and controlled quantity of hypochlorite, generally about 2 per cent, then passes by pipes to the point where it is desired to add the solution to the water supply.

Vent and Catch Box

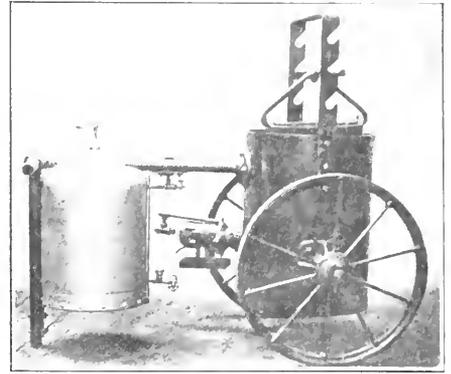

The Shuster Plumbing Supply Company, northeast corner of Franklin and Willow Streets, Philadelphia, Pa., manufacture a combination vent and catch box, shown in the illustration. The vent is for use as an air inlet to a house drainage system and is ordinarily set in the sidewalk or lawn, where, if there is no means provided for keeping out the dirt, it is apt to fill up and render the ventilating system useless. In the Shuster vent, the

COMBINED CATCH BOX AND FRESH AIR INLET. air pipe to the sewer is offset. Half of the cover is perforated and under the perforated section is the catch box.

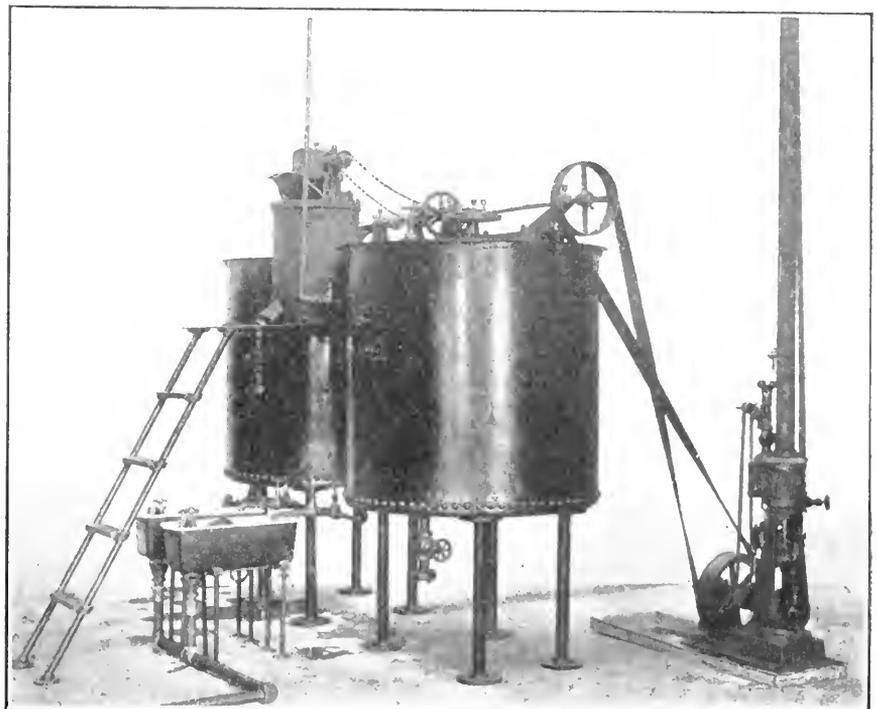

Portable Lead Furnace Using Kerosene as Fuel

THE Hauck Manufacturing Company, 140 Livingston street, Brooklyn, N. Y., who are specialists in the manufacture of kerosene torches and oil burning appliances, manufacture a portable lead melting furnace shown in the illustration. The burners attached to the furnace are of the compressed air type. The air tank is carried firmly on a framework connecting the lead pot with a leg on which the outfit rests when not being moved about. The air

LEAD FURNACE.

pump is of the direct piston type, no troublesome levers to get out of order. An air gauge is provided, as well as necessary valves for air and oil. The furnace wheels are made of steel with wide rims. A convenient rack over the furnace allows the melting pot to be held at such height as is desired. These melting furnaces are made in three sizes—13½-inch diameter, 6½ inches deep, capacity 200 pounds; 15-inch diameter, 11 inches deep, capacity 450 pounds, and 18-inch diameter, 13 inches deep, capacity 850 pounds. The Hauck kerosene burner produces a clear flame and eliminates the dangers of gasoline explosions.

PLANT FOR MIXING HYPOCHLORITE LIME WITH WATER.

NEWS OF THE SOCIETIES

International Association of Chiefs of Police.—The eighteenth annual convention was held at Rochester, N. Y., June 13-16. Major Richard Sylvester, Superintendent of Police, Washington, D. C., president of the association for the past ten years, presided. Mayor Hiram H. Edgerton made the address of welcome, expressing the hope that the members would have time to look at the beautiful homes and parks of Rochester. Major Sylvester replied. He then invited Chief W. S. Seavy, Seattle, Wash., to take a seat on the platform. Chief Seavy, while chief at Omaha, conceived the idea and took the first steps toward the formation of a police association. In his annual address Major Sylvester spoke of the value of the association. He said an identification bureau acted as a deterrent to crime, but there was no general bureau. In the United States 134 cities use the Bertillon system and 69 the system of identification by finger prints, but of these 64 also used the Bertillon system, so that there are really 169 departments which used identification systems. Major Sylvester spoke of the immigration criminal situation and referred to many of the problems which confront the chief in the performance of his duty.

On Wednesday, the second day of the convention, John B. Taylor, Superintendent of Police, Philadelphia, Pa., read the report of the National Bureau of Criminal Identification. He said that nearly 10,000 new descriptions were added during the past year, 719 identifications were made and nearly 14,000 letters were written. Arrangements are being made to install the finger print system on July 1.

President Sylvester read communications from a number of police chiefs of foreign countries, including the Prefect of Police, Paris; the Commissioner of Police, Vienna; the Chief Constable of Glasgow; the Inspector General of Police of New South Wales and chiefs of a number of South American cities.

Chief William Young, St. Louis, read a paper, in which he referred to the development of the police system of getting evidence. Superintendent of Police John B. Taylor, Philadelphia, read a paper on the carrying of concealed weapons, which he considered as one of the most important questions of the day. Federal and State constitutional provisions giving citizens the right to bear weapons were quoted. The carrying of concealed weapons with unlawful intent is quite another matter. When a crime is committed the police are confronted with the difficulty of tracing a weapon to its user because of lack of proper supervision of the sale of these weapons. Statistics gathered from 13 cities show how serious this condition of affairs has grown to be. There were 3848 arrests in 1909 for carrying concealed deadly weapons, and in 1910 this record grew to 3904. There were 2081 arrests in 1909 for murder, manslaughter and similar crimes committed by the use of revolvers, and in 1910 this number increased to 3172. The speaker said that laws should be passed in all States making it obligatory on all retail dealers to keep a daily record of all sales of weapons and explosives.

Joseph Rogers of the Ontario Provincial Police read the Canadian law,

which went into effect in April, regarding the carrying of weapons. He said it had met with universal favor.

Commissioner Dougherty, New York, referred to the way in which one of his men detected gun toters. He watched the pawnbrokers' offices and when a man purchased a gun he followed him outside and arrested him. A banquet was given at the Powers Hotel Wednesday evening.

On Thursday morning the session began with the reading of a paper by Chief W. E. Griffin, Kansas City, on the Relation of Police Departments to Other City Departments. He said the police department should be looked upon as the strong arm to assist all other municipal departments. He recommended having the police officer assist in taking care of the condition of the city by reporting such things as defective sidewalks, piles of rubbish, nuisances, etc. He also referred to one of his men who has the position of assistant to the unemployed, and his duty was to visit the cheap lodging houses and assist in obtaining employment for the men.

Chief Henry D. Cowles, New Haven, described the probation system in vogue in New England. He said that cheap poolrooms and like places tended to develop criminal instincts. Idleness is the mother of crime, and children should be kept busy. The results obtained by the probation law were not satisfactory. Too much sympathy with young criminals demoralized both officers and accused. The methods employed by the police years ago were more effective than those employed now.

Joshua B. Gray read a paper on Probation Laws and Their Workings. His observations were unfavorable to the work of the probation officers.

Deputy Police Commissioner George M. Dougherty, New York City, spoke of the benefits derived from the finger print system of identification as used in the New York detective bureau.

On Thursday, the final day of the session, the entire list of officers was re-elected and Toronto was selected as the next meeting place. The officers are: Major Richard Sylvester, Superintendent of Police, Washington, D. C., president; Michael Regan, Chief of Police, Buffalo, N. Y., first vice-president; Joseph M. Quigley, Chief of Police, Rochester, N. Y., second vice-president; Harvey O. Carr, Chief of Police, Grand Rapids, Mich., secretary-treasurer. As a token of their appreciation of his efforts in behalf of the association and the convention Chief Quigley was presented with a handsome engraved gold watch and chain with a diamond studded watch charm and Mrs. Quigley was presented with a pair of gold candlesticks and a gold clock.

Chief Vincent McKinnon, Superior, Wis., presented the first paper of the morning on the Juvenile Offender. He said there was no subject or field of activity on which the police are daily called to act which requires so intelligent efforts as the treatment of the juvenile offender. The criminal of to-day was the juvenile delinquent of yesterday. The speaker said that one of the grandest institutions ever devised by law is the establishment of the juvenile court. It could be much more effective, he said, if its decrees were placed in the hands of trained and experienced men and women for execution rather than as now, in many cases, in the hands of police

officers. "It is vital and imperative that our probation officers should not only be schooled in their work, but they should also have that natural inherent personality that makes for the highest degree of success in this noble and important calling, and in my judgment both the institutional and court probation officer should by statute be made civil service officers and they should be required to pass an examination testing their fitness to qualify for the work.

"Ninety-five per cent. of our juvenile offenders are normal boys and girls, and under sixteen years of age they are all plastic or corrigible and susceptible, under intelligent guidance, to influences that make for better citizenship. Mark you well, the time is coming, slowly perhaps, but surely, when this important problem will, because of its possibilities and far reaching influences, overshadow all other social and economic problems, and I trust and hope that in the vanguard in this noble work will be found every chief of police in this our beloved country."

Chief Carlos M. Aguirre of Havana, Cuba, presented a paper, which was read by President Sylvester and vigorously applauded, in which he described fully the workings of the Havana police.

President Sylvester introduced Eugene Van Buskirk, superintendent of the National Bureau of Identification, who spoke at some length on how the best results could be obtained by the subscribers to the bureau.

Chief Regan of Buffalo, invited the members to visit Buffalo and inspect a new signal system which has been installed in one precinct.

After the reading of the papers in the afternoon the party took chartered cars to Manitou Beach, where the afternoon was spent and dinner served. In the evening they went to Ontario Beach Park.

There were a number of exhibitions of police equipment in a room adjoining the convention hall. One of the best exhibits was that conducted by the Charles D. Reese Company of New York, manufacturer of badges and all sorts of police paraphernalia. Arranged at the rear of the booth are a score of pretty, tasteful police badges; on the sides Mr. Reese had hung police clubs, pocket billies, ankle irons, handcuffs, thumb cuffs, whistles, leg irons, belts, cords, tassels and straps. One of the devices that seemed to attract considerable attention from the visiting chiefs is a new bed strap device, to be used in preventing insane persons or persons afflicted with the delirium tremens from harming themselves. Mr. Reese himself was in charge of the exhibit and his class of goods attracted considerable comment. Mr. Reese manufactured the gold badges being worn by Chief Quigley and Inspector Zimmerman, and he had on exhibition several duplicate gold badges manufactured for chiefs of police of other cities.

New York State Association of Chiefs of Police.—The annual convention was held, Rochester, N. Y., June 13-16. President James W. Rynex, Chief of Police, Schenectady, in his annual address spoke of the laws pending in the State Legislature affecting the work of police departments. One of these, amending the penal law relating to assaults upon or oppression of persons under arrest, would prohibit the taking of data for purposes of identification and the questioning of prisoners

except in the presence of counsel. If passed, he said, this law would greatly hamper the work of police departments. A measure providing for the establishment of a State farm for tramps was highly commended. He recommended the organization of classes for the instruction of policemen in first aid to the injured. At the afternoon session the following officers were elected: President, Charles H. Goodrich, Binghamton; vice-president, James J. Lang, Little Falls; secretary-treasurer, James L. Hyatt, Albany, re-elected; director for three years, James Donovan, Port Chester. Binghamton was chosen as the place for next year's convention.

International Association for the Prevention of Smoke.—The convention will begin at 10 o'clock, June 28, in the council chamber of the City Hall, Newark, N. J. Mayor Haussling will deliver an address of welcome, which will be responded to by the chairman of the convention. The formalities of ascertaining the representations of active and associate members present and reports of standing committees will consume the morning session.

The afternoon session of Wednesday will be held in the board of works room, which is adapted to the use of slides for pictures. There will be an illustrated address on the subject of "Gas Producers, the Burning of Fuels Smokelessly and the Value of Briquets," by Professor R. H. Ferrald, chief engineer of the United States Geological Survey.

Another address of this session will be by James T. Whittlesey, chief engineer of the Public Service Electric Company. He will be assisted by Henry S. Vasser, assistant chief engineer of the same company. The addresses will be followed by a general discussion of the subjects.

There will be a discussion of mechanical stokers and steam jet devices, special furnaces and devices for smoke prevention and economy Wednesday night.

One session only will be held on the second day of the convention. That will be in the morning, when Dr. Ernest J. Lederle, of New York, will deliver an address on the progress of the movement for smoke prevention and regulation in that city, of which he is Health Commissioner. Richard J. Watrous, secretary of the American Civic Association, will deliver an address at this session on "Smoke vs. City Beauty."

Thursday afternoon will be devoted to entertainment. The delegates and their wives will be taken for a trip to Coney Island, with a tour of Luna Park and other amusement places and a clam bake dinner at Feltman's as incidents.

The session Friday morning will begin at 9.30 o'clock. A paper on the workings of the recently enacted Ohio smoke law, prepared by State Senator John Krause, formerly smoke inspector of the city of Cleveland, will be read.

There will also be discussion relative to railroad smoke and the efforts to abate it. Representatives of the railroads and members of the association will take part in this discussion.

Other short addresses will be made on appropriate subjects, and the final session will witness the election of officers for the ensuing year, the selection of the convention city and the farewell address, which will be made by Secretary-Treasurer Richard C. Harris, of Toronto, Can. F. E. P.

Calendar of Meetings

- June 21-22. National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- June 21-22. New York State Association of Fire Chiefs.—Annual Convention, Glens Falls, New York.—Henry R. Yates, Secretary, Schenectady, N. Y.
- June 22-24. Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.
- June 26-27. Kentucky State Firemen's Association. Annual Convention, Covington, Ky.
- June 27-29. South Carolina State Firemen's Association.—Annual Convention, Columbia, S. C.—Louis Behrens, Charleston, S. C.
- June 27-29. Northwestern Indiana Volunteer Firemen's Association.—Annual Convention, Winchester, Ind.—Chief Guy Way, Winchester, Ind.
- June 27-July 1. American Society for Testing Materials.—Fourteenth Annual Meeting, Hotel Traymore, Atlantic City, N. J.—Edgar Marburg, Secretary, University of Pennsylvania, Philadelphia, Pa.
- June 28-29. South Carolina Water Works Association.—Meeting for Organization, Columbia, S. C.—W. F. Steiglitz, Temporary Secretary, Columbia, S. C.
- June 28-30. International Association for the Prevention of Smoke.—Annual Convention, Newark, N. J.—R. C. Harris, Secretary, City Hall, Toronto, Ont.
- July 3-8. South Dakota State Firemen's Association.—Tournament and Convention, Lead, S. D.—Charles P. Coolidge, Lead, S. D.
- July 21-23. Wisconsin State Firemen's Association.—Annual Convention, Fort Atkinson, Wis.
- July 25-26. Western New York Firemen's Association.—Convention, Springville, N. Y.
- July 25-28. Iowa Firemen's State Association.—Tournament, Des Moines, Ia.—N. J. Francis, Secretary, Des Moines.
- August 1-3. Ohio Chiefs' Association.—Convention, Cedar Point, O.—Chief, A. Hegeman, Cedar Point.
- August 15-17. Utah State Firemen's Association.—Convention, Provo, Utah.—C. F. Stillman, Bingham, Utah.
- August 15-18. Firemen's Association of the State of New York.—Rochester, N. Y.—Thos. Honohan, Secretary, Frankfort, N. Y.
- August 23-25. Virginia State Firemen's Association.—Convention and Tournament, Newport News.
- September 12-15. International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 18-30. International Municipal Congress and Exposition.—Chicago, Ill.—Curb M. Treab, Secretary, Great Northern Building, Chicago, Ill.
- September 18-October 1. Fourth International Good Roads Congress.—Chicago, Ill.—J. A. Rountree, Secretary, Birmingham, Ala.
- September 19-22. International Association of Fire Engineers.—Annual Convention, The Auditorium, Milwaukee, Wis.—James McFall, Secretary, Roanoke, Va.
- September 19-22. American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30. International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29. American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6. League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.
- November 13-17. National Municipal League.—Annual Meeting, Richmond, Va.—Clinton Rogers Woodruff, Secretary, North American Building, Philadelphia, Pa.

PERSONALS

AGUIRRE, COL. CHARLES M., Chief of Police of Havana, Cuba, attended the police convention in Rochester last week. Colonel Aguirre, who was appointed to the command of the Havana police on March 1, has established many reforms during his three months of service and has reduced the number of monthly robberies to about one half.

AYMARD, L. G., for over four years city clerk of Pensacola, Fla., has been reappointed by Mayor Reilly, and the appointment unanimously confirmed by the city council.

BENNETT, E. H., civic architect, has prepared plans and sketches for the improvement of Portland, Ore., which were on exhibition at the recent City Planning Convention at Philadelphia, and attracted a great deal of attention. In the month of July the great development scheme is to be submitted by Mr. Bennett for the city's adoption.

BLAKE, G. IRVING, has been appointed chairman of a committee to plan for making a city beautiful of Erie, Pa. Mr. Blake, while residing in Hartford, Conn., was secretary of the city planning movement there. It is the idea of the committee to plan a system of harmonizing the parks, boulevards, grade crossings, business thoroughfares and residence avenues so that all will tend to a city beautiful.

BROWN, FRANK, former Governor of Maryland, has resigned as City Collector of Baltimore.

BROWN, COL. OSCAR, has been elected Mayor of Lulu, Ga.

CALLAGHAN, BRYAN, is the new Mayor of San Antonio, Tex.

CHRISTENBERY, DR. H. E., has been elected Mayor of Knoxville, Tenn.

CURTIS, DR. HENRY S., playground expert, has been engaged to give a course of lectures and instruction at the University summer school at Salt Lake City.

DILLON, JAMES E., has been appointed fourth deputy police commissioner of New York City under Commissioner Waldo.

FORD, FREDERIC L., of Hartford, Conn., recently delivered a lecture on City Planning at Tampa, Fla.

GAMPER, HERMAN, superintendent of the municipal light plant of Columbus, Ohio, has handed in his resignation to Mayor Marshall, to take effect on July 15, on which date he will go to Erie, Pa., to accept the superintendency of the light plant of the Erie Electric Light Co.

GOLDSBOROUGH, A. S., who for four years has been secretary to Mayor Mahool, of Baltimore, has been appointed secretary to the Factory Site Commission in that city, at a salary of \$3,000.

GROTTA, DAVID, has been elected chairman of the City Plan Commission recently appointed by Mayor Haussling, of Newark, N. J.

HOWELL, DR. HARRISON W., is the new Mayor of Wilmington, Del.

MANON, THOMAS H., an English landscape artist who is now in this country studying the rapid advancement that is being made here in altering our towns on scientific lines, has received offers from Cornell, Yale and Harvard to establish a chair of "City Planning."

SPEER, ROBERT W., Mayor of Denver, has sailed for Europe. At Boston he joined the civic party which sailed June 17 from New York to study the municipal activity of the old world. In Paris Mayor Speer will go over with Frederick McMonnies the plan for Denver's civic center, which has been approved after a long fight in the courts.

THE MUNICIPAL INDEX

In Which Are Listed and Classified by Subjects All Articles Treating of Municipal Topics Which Have Appeared During the Past Month in the Leading Periodicals

It is our purpose to give in the second issue of each month a list of all articles of any length or importance which have appeared in all the American periodicals and the leading English, French and German ones, dealing more or less directly with municipal matters. The index is kept up to date, and the month of literature covered each time will be brought up to within two or three days of publication. Our chief object in this is to keep our readers in touch with all the current literature on municipal matters. In furtherance of this we will furnish any of the articles listed in the index for the price named after each article, except that where an article is continued in two or three issues of the paper, the price given is for each of said issues. In addition to the titles, where these are not sufficiently descriptive or where the article is of sufficient importance, a brief statement of its contents is added. The length also is given, and the name of the author when it is a contributed article.

ROADS AND PAVEMENTS

Road Improvement in the South. By the U. S. Office of Public Roads. Illustrated, 8 pp., Better Roads, May. 10 cts.

Road Construction in Dade County, Florida. Illustrated, 1 p., Contractor, June 1. 20 cts.

A Modern California Highway. By P. E. Clark. 2 pp., Good Roads, May. 10 cts.

South California Roads. 1-4 pp., Municipal Journal, May 17. 10 cts.

Road Construction in British Columbia. 1 1-2 pp., Contract Record, May 3. 20 cts.

Road Methods in Great Britain. Road Board's directions and specifications for surface tarring, tar macadam and pitch grouted macadam. Specifications for tars from gas works and tar distillers, pitch and tar oils. 3 pp., Municipal Journal, May 17. 10 cts.

Work of the Los Angeles County Highway Commission. 3 pp., Engineering Record, May 20. 10 cts.

Road Improvement in Nova Scotia. 1-3 p., Municipal Journal, May 17. 10 cts.

Highway Improvement. Construction and maintenance of earth, sand-clay and oiled earth roads, and culverts. By W. S. Gearhart. Illustrated, 92 pp., Bulletin, Kansas State Agricultural College.

Permanent Way and Highways of Croydon. Paper before Institution of Municipal and County Engineers. By E. F. Morgan. 3 1-2 pp., Surveyor, June 2. 40 cts.

Mountain Road Construction in California. 1 p., Engineering-Contracting, May 21. 10 cts.

Road Building in Delaware. 1-4 p., Municipal Journal, May 17. 10 cts.

Newhall Highway Tunnel, near Los Angeles. Illustrated, 1 1-2 pp., Engineering Record, May 20. 10 cts.

Construction of the Galveston Causeway. Illustrated, 3 pp., Engineering Record, May 27. 10 cts.

Progress of Road Improvements in the South. Paper before Good Roads Congress at Birmingham. By L. W. Page. 1 2-3 pp., Engineering Record, June 3. 10 cts.

Missouri's Diversified Roads. 1-4 p., Municipal Journal, May 17. 10 cts.

Roads of London. 1 1-2 pp., Good Roads, May. 10 cts.

Road Improvements in West Virginia. 1-2 p., Municipal Journal, May 17. 10 cts.

Road Work in Massachusetts. Surface treatment recommended for light traffic; heavy oils heated for surface preservation. Oil and sand building up process. 1 p., Municipal Journal, May 17. 10 cts.

Highways of Croydon. By E. F. Morgan. 2 pp., Contract Journal, April 26. 20 cts.

Experimental Road Work in Allegheny County, Pa. Paper before Engineers' Society of Western Pennsylvania. By S. D. Foster. 1 p., Engineering-Contracting, May 31. 10 cts.

Modern Road Experiments. 1-4 p., Municipal Journal, May 17. 10 cts.

Notes on Object Lesson Macadam Roads Constructed in 1909-10 by the U. S. Office of Public Roads. 1 p., Engineering-Contracting, May 17. 10 cts.

The Bronx Experimental Road. Methods of laying and cost of each of eighteen sections; conditions after six months' use. Bituminous pavements: hand and machine mixing and penetration method. Illustrated, 7 pp., Municipal Journal, May 17. 10 cts.

Demonstration of Constructing Roads. By Curtis Hill. Illustrated, 7 pp., Public Officials' Magazine, May. 10 cts.

Laboratory, Ohio State Road. 1-3 p., Municipal Journal, May 17. 10 cts.

Mechanical Tests to Determine the Relative Value of Various Stone for Road Construction and Maintenance. Paper before Second Irish Road Congress. By H. F. Gullan. 1 p., Engineering-Contracting, May 17. 10 cts.

Road Problem in the Light of Our Present Information. Paper before National Good Roads Congress. By Clifford Richardson. 2 pp., Engineering Record, May 27. 10 cts.

Road Administration, Principles Which Should Govern in. By L. W. Page. Illustrated, 3 pp., Southern Good Roads, June. 10 cts.

State Supervision of Public Roads. By

J. H. Pratt. Illustrated, 3 pp., Southern Good Roads, June. 10 cts.

Tabular Data Concerning State Aid. 2 pp., Municipal Journal, May 17. 10 cts.

Instructions of the Ohio State Highway Department for Inspectors on State Aid Road Work. 1 1-2 pp., Engineering and Contracting, June 7. 10 cts.

Building, The Tractor in Road. Illustrated, 4 1-2 pp., Good Roads, May. 10 cts.

Specifications for Michigan Highways. Construction necessary for receiving state reward; specifications for clay-gravel, gravel, stone-gravel, gravel-stone and stone roads. 1 3-4 pp., Municipal Journal, May 17. 10 cts.

Specifications for Macadam Roads. Bituminous macadam and bituminous concrete paving; asphalt and coal tar cements. Mixing and laying. 3 pp., Municipal Journal, May 17. 10 cts.

Discussion of Road Board's Specifications. 5 pp., Surveyor, May 5; 3 pp., May 12. 40 cts.

Grade Crossing Elimination in Bloomfield and Montclair. Illustrated, 3 pp., Engineering Record, June 10. 10 cts.

Culverts, Some Facts Concerning Concrete. By C. H. Hoyt. Illustrated, 2 pp., Southern Good Roads, May. 10 cts.

Engineering, Art and Science in Highway. By W. W. Crosby. 2 pp., Good Roads, May. 10 cts.

Park Roads. Construction and maintenance of park roads by Metropolitan Park Commission of Massachusetts. 1 p., Municipal Journal, May 17. 10 cts.

Parks and Boulevards of Oklahoma City. By S. T. Bisbee. Illustrated, 2 pp., Municipal Engineering, June. 25 cts.

Sand Clay Object Lesson Road Constructed in 1909-10 by U. S. Office of Public Roads, Some Details of. 2 pp., Engineering-Contracting, May 3. 10 cts.

Gravel as a Road Material. By C. E. Morrison. Illustrated, 3 pp., Good Roads, May. 10 cts.

Traffic, Effect of Motor, on Oil Macadam. By J. S. Van Ornum. 3 pp., Pacific Municipalities, April 29. 20 cts.

Growth of Ordinary Traffic on Irish Rural Roads. Paper before Second Irish Road Congress. By E. K. Dixon. 1 p., Surveyor, May 12. 40 cts.

Development of Mechanical Traction on Roads in Great Britain. Paper before Institution of Mechanical Engineers. By L. A. Legros. 1 p., Engineering News, May 4. 15 cts.

Culs-de-Sac. Roads that are Not Public Roads, and. Paper before Second Irish Road Congress. By W. J. Shannon. 1-2 p., Surveyor, May 5. 40 cts.

Footway Tunnel, Woolwich. Paper before Institution of Municipal and County Engineers. By E. H. Tabor. 1 p., Surveyor, June 2. 40 cts.

Association for Highway Improvement. 1-4 p., Municipal Journal, May 17. 10 cts.

Abstracts of Papers before Irish Road Congress. 3 pp., Contract Journal, April 26; 2 pp., May 3; 3 pp., May 10; 1 p., May 17. 20 cts.

Oil Macadam Specifications Compared. 1 p., Municipal Journal, May 17. 10 cts.

Construction of Oil Macadam Roads in Los Angeles County, Cal. 4 pp., Engineering-Contracting, May 21. 10 cts.

Oil and Tar Distributors. Illustrated, 4 pp., Good Roads, May. 10 cts.

Cost of Oiling Roads. 1-4 p., Municipal Journal, June 7. 10 cts.

Tar Macadam, Kentish Rag. Paper before Institution of Municipal and County Engineers. By T. W. Harrison. 2 pp., Surveyor, May 26. 40 cts.

General Directions and Specifications of the Road Board of Great Britain for the Treatment of Roads with Tar. 2 1-2 pp., Engineering & Contracting, June 7. 10 cts.

Dust Prevention and City Streets. 1-2 p., Municipal Journal, June 7. 10 cts.

Dust and Its Prevention on City Streets. From paper before New England Conference on Street Cleaning. By A. H. Blanchard. 2-3 p., Engineering and Contracting, June 7. 10 cts.

Additional Data on Artificial Dust Layers. Illustrated, 1 1-2 pp., Good Roads, May. 10 cts.

Bituminous Road Compounds, The Scale Paraffine Test as Applied to. By A. W. Dow and F. P. Smith. 3 pp., Engineering News, June 8. 15 cts.

Street Widths, Economic Aspects of. Paper before Third National Conference of City Planning. 3-4 p., City Life, May 25. 5 cts.

Standardized Street Widths. Paper before Third National Conference of City Planning. By John Nolen. 1 1-3 pp., Engineering-Contracting, May 31. 10 cts.

Street Standards and "Elastic" Streets. Street Planning to provide for both present and future; scientific calculation of traffic requirements; initial provision for widening roadway and sidewalk. Papers before National Conference of City Planning. By John Nolen and B. A. Haldeman. Illustrated, 5 1-2 pp., Municipal Journal, June 7. 10 cts.

Standardized Street Widths. Paper before Third National Conference on City Planning. 1 p., Engineering News, May 25. 15 cts.

Width of Wholesale Streets. 1-4 p., Municipal Journal, June 7. 10 cts.

Narrowing Minor Residence Streets. Effect on tenants and property owner; too wide streets require crowded buildings; buildings restriction. From paper before Street Planning Convention. By E. M. Robinson. 2 pp., Municipal Journal, May 24. 10 cts.

Street Surface, The. By G. W. Tillson. 2 1-2 pp., Canadian Municipal Journal, June. 10 cts.

Roads and Pavements in the Borough of Richmond. By T. S. Oxholm. Illustrated, 5 pp., Good Roads, May. 10 cts.

Chicago Street Paving Report. Organization of street department complete and efficient; specifications and contracts criticized; concrete foundations; vehicle tax. From report to Chicago Commission on City Expenditures. By S. Whinnery. 2 pp., Municipal Journal, May 10. 10 cts.

Street Work in Madison, Wis. Tar-bound macadam petitioned for; protecting gutters while applying oil; oiling lessens cost of cleaning catch basins. 1-2 p., Municipal Journal, May 17. 10 cts.

Some Features of Streets and Buildings under the English Public Health Acts. Paper before Institution of Engineers. By J. R. Fayres. 3 pp., Surveyor, May 5. 40 cts.

Pavement Crowns in Washington. Method used for seventeen years; development of formulas for curbs at same and at different elevations. From paper before American Society of Civil Engineers. By T. J. Powell. 3-4 p., Municipal Journal, May 10. 10 cts.

Street Paving Crowns, Washington, D. C. From paper before American Society of Civil Engineers. By T. J. Powell. Illustrated, 1 p., Canadian Engineer, May 4. 15 cts.

Granite Block Specifications of Association for Standardizing Paving Specifications. 2 pp., Canadian Engineer, May 11. 15 cts.

Wood Block Pavement in Chicago. Creosoted. From Report by S. Whinnery to Commission on City Expenditures. 1 p., Engineering Record, May 13. 10 cts.

Brick, Standard Rattler for Testing Paving. 1 p., Engineering-Contracting, May 10. 10 cts.

Causes of Cracking in Cement Grouted Brick Pavements. From Paper before Michigan Engineering Society. By E. R. Whitmore. 1 p., Good Roads, May. 10 cts.

Asphalt Pavement Construction. By S. R. Murray. 1 p., Municipal Journal, May 24. 10 cts.

Asphalt Paving History in New York. Communication from E. P. North. 2-3 p., Engineering Record, May 13. 10 cts.

Plants and Methods of Operation of the Asphalt Paving Companies Operating in New York City. From paper before Brooklyn Engineers' Club. By G. B. Goodsell. 1 p., Engineering-Contracting, May 3. 10 cts.

Asphalt Repairing in Reading. 1-4 p., Municipal Journal, May 31. 10 cts.

Denver Municipal Asphalt Plant. Work done during 1910. Repairs, cement gutters, costs of materials, labor and plant. By

S. R. Murray, Superintendent of Plant. 3-4 p., Municipal Journal, May 10. 10 cts.

Concrete Street Paving in Mason City, Ia. Paper before Iowa Engineering Society. By F. P. Wilson. 2-3 p., Engineering News, June 8. 15 cts.

Concrete Roads in Michigan. 1-4 p., Municipal Journal, May 17. 10 cts.

Suggested Concrete Roadway with Reinforcement of Steel near Top Surface. 1-3 p., Engineering Record, June 7. 10 cts.

Portland Cement Concrete in Highway Construction. Paper before Canadian Cement and Concrete Association. By W. A. McLean. 4 pp., Cement, April. 25 cts.

2-1-2 pp., Concrete, May. 15 cts.

Sidewalk Fallacies. By J. B. Landfield. 1 p., Municipal Journal, May 31. 10 cts.

Notes on Concrete Sidewalk Construction. By J. B. Landfield. 1-1-2 pp., Contract Record, May 31. 20 cts.

Curb and Sidewalk Work, Macadam and Brick Paving at Gary, Ind. 4 pp., Engineering-Contracting, May 10. 10 cts.

Maintenance of Rural Highways. From paper before Second Irish Road Congress. By Arthur Gladwell. 1 p., Engineering-Contracting, May 17. 10 cts.

Road Appliances, Home-Made. Illustrated. 1-1-2 pp., Municipal Journal, May 17. 10 cts.

Control and Cleaning of Streets. Entire control of street pavement, including sidewalks, under one authority; suggested method of assessing cost; broom cleaning and flushing. Paper before Conference of Mayors of New York State. By A. Prescott Folwell. 2 pp., Municipal Journal, June 7. 10 cts.

House Numbering by Latitude and Longitude. 1-4 p., Municipal Journal, May 10. 10 cts.

SEWERAGE AND SANITATION

Sewerage System, Revision of Downtown Chicago's. 2 pp., Engineering-Contracting, May 17. 10 cts.

Main Drainage of Govan, Scotland. Paper before Institution of Municipal and County Engineers. By F. G. Holmes. 1 p., Engineering Record, June 3. 10 cts.

Sewer Work Costs. Comments on Excavation and. From paper before Western Society of Engineers. By Victor Windett. 2 pp., Engineering Record, June 10. 10 cts.

Cost of Pipe Sewers and Appurtenances in Water Bearing Sand, Gary, Ind. Illustrated, 2 pp., Engineering-Contracting, May 10. 10 cts.

Sanitary Engineering Conditions in Milwaukee. 1-1-3 pp., Engineering Record, May 20. 10 cts.

Sewage-Polluted Sea Water with One per Cent Sewage, Chemical Changes Occurring in. By E. A. Lettis and E. H. Richards. 7 pp., Journal, Royal Institute of Public Health, May. 60 cts.

Sewage Disposal Works, Proper Methods for Guarding Against Odors in. Address before Congress of Technology. By G. W. Fuller. 3 1-2 pp., Canadian Engineer, May 4. 15 cts. 3 pp., Municipal Engineering, June. 25 cts.

Disposal of Sewage and Protection of the Water Supply of the City of Milwaukee. From Report by J. W. Alford, G. C. Whipple and H. P. Eddy. 6 pp., Engineering-Contracting, May 24. 10 cts.

New Sewage Disposal Works and Pumping Station, Stratford-upon-Avon. Paper before Municipal and County Engineers. By H. D. Bell. 1 p., Contract Journal, May 17. 20 cts. 1 p., Surveyor, May 26. 40 cts.

Sewage Purification at Reading. 1-2 p., Municipal Journal, May 31. 10 cts.

Treatment of the Govan Sewage. Paper before Institution of Municipal and County Engineers. By W. C. Easton. Illustrated, 3 pp., Surveyor, June 2. 40 cts.

Purification of Sewage. By M. de Montriehier. 5 pp., La Technique Sanitaire, May. 50 cts.

Experimental Imhoff Sewage Clarification Tank at Philadelphia and the Original Tanks in the Emscher District of Germany. By Rudolph Hering. 1-1-3 pp., Engineering News, June 1. 15 cts.

Sediment in an Experimental Imhoff Tank. 1 p., Engineering Record, May 13. 10 cts.

Financial Losses and Proposed Preliminary Treatment of Sewage at the Berlin Sewage Farm. 1-2 p., Engineering News, May 4. 15 cts.

Grossman System of Sludge Treatment. 1-4 p., Municipal Journal, June 11. 10 cts.

Health Laws of North Carolina, Act to Amend the. 15 pp., Bulletin, North Carolina Board of Health, March.

Municipal Ordinances, Rules and Regulations Pertaining to Public Hygiene Adopted Since Jan. 1, 1910. Public Health Reports, 4 pp., June 2; 4 pp., May 26; 3 pp., May 12; 4 pp., May 19; 3 pp., June 9.

Function of Research in Municipal Health Administration. From Bulletin, Department of Health, New York. 2 pp., City Life, May 25. 5 cts.

Milk: From Cow to the Consumer. Paper

before Ohio Boards of Health. By G. D. Lummis. 5 pp., Bulletin, Ohio State Board of Health, April.

Diseases, The Fight Against Preventable. Paper before Association of Life Insurance Presidents. By E. H. Porter. 5 pp., Bulletin, Texas State Board of Health, April.

WATER SUPPLY

Water Supply of Marseilles. By M. de Montriehier. 4 pp., La Technique Sanitaire, May. 50 cts.

Catskill Water Supply. Progress made to date on the Ashokan reservoir and aqueduct; masonry dam will be completed this year. Expansion joints; tunneling under the Hudson; mud seams and caves; handling seepage. Illustrated, 4 1/2 pp., Municipal Journal and Engineer, June 11. 10 cts.

New Water Supply of Tynemouth, England. By H. G. Coventry. Illustrated, 3 pp., Engineering Record, June 3. 10 cts.

Existing Los Angeles Water Works. By B. A. Heintz. Illustrated, 7 pp., Municipal Engineering, June. 25 cts.

Water Works of Danville, Ill. Illustrated, 4 pp., Municipal Engineering, June. 25 cts.

Greenwood (S. C.) Water and Light Plant. 1/4 p., Municipal Journal and Engineer, May 10. 10 cts.

Water Supply and Fire Protection in the Klondike Gold Fields. 2 pp., Engineering Record, June 3. 10 cts.

Wells, Determining Yield Of. Paper before Illinois Water Supply Association. By A. N. Talbot. Illustrated, 1 1/2 pp., Canadian Engineer, May 11. 15 cts.

Methods and Costs of Deep Well Drilling. From Water Supply Paper No. 257, U. S. Geological Survey. Illustrated, 5 pp., Engineering-Contracting, May 3. 10 cts.

Reservoirs, Construction of Impounding. Paper before Association of Water Engineers. By Edw. Sandeman. Illustrated, 4 1/2 pp., Canadian Engineer, June 8. 15 cts.

Survey of a Reservoir, Made from a Barge. By H. B. Joslin. Illustrated, 2-3 p., Engineering News, June 8. 15 cts.

Constructing of Impounding Reservoirs. Paper before Association of Water Engineers. By Edw. Sandeman. Illustrated, 4 pp., Surveyor, May 19. 40 cts.

The Island Barn Reservoir. Illustrated, 4 pp., Contract Journal, May 3. 20 cts.

Dam Construction, Masonry. Provision for slight settlement and resulting stresses; increase in unit pressure and reduction in section warranted; American engineers commended. Illustrated, 1 1/4 pp., Municipal Journal and Engineer, June 14. 10 cts.

Geology of Dam Trenches. Paper before Association of Water Engineers. By Herbert Lapworth. 2 pp., Surveyor, May 26. 40 cts.

Run-Off, of Minnesota Streams, Variability of During the Low Water Season of 1910. By Robt. Follansbee. Illustrated, 3 pp., Engineering News, May 4. 15 cts.

Interstate Waters, the Law Governing Division of. By C. F. Randolph. 2-1-3 pp., Engineering News, June 1. 15 cts.

Interstate Waters, the Law Governing of. By C. F. Randolph. 2-1-3 pp., Engineering News, June 1. 15 cts.

Law Regarding Control of Waters Crossing State Boundaries. 1-1-3 pp., Engineering News, June 1. 15 cts.

Intake Troubles, Toronto Water Works. Six-foot steel pipe intake stopped with anchor ice; pipe shifted and filled with sand; method of cleaning. Illustrated, 2 pp., Municipal Journal and Engineer, May 10. 10 cts.

Tanks, Concrete, and How to Make Them. From pamphlet issued by Association of American Portland Cement Manufacturers. Illustrated, 2 pp., Canadian Engineer, May 11. 15 cts.

Pipe, Steel and Cast Iron. Paper before American Water Works Association. By Allen Hazen. 1 1/2 pp., Fire and Water, June 7. 10 cts.

Flow of Water in Clean Iron Pipes. By A. E. Guy. Illustrated, 3 pp., Power, June 6. 5 cts.

Instrument for Measuring the Flow of Water in Large Pipe Lines. Paper before Western Society of Engineers. By R. M. Hosea. 2 pp., Engineering-Contracting, May 24. 10 cts. Illustrated, 1 1/2 pp., Engineering Record, May 27. 10 cts.

Aqueduct, Los Angeles. Illustrated, 7 pp., Pacific Municipalities, May. 20 cts.

Tunnel, Rondout Pressure of the Catskill Aqueduct, New York City. By A. D. Flinn. Illustrated, 7 pp., Engineering News, June 1. 15 cts.

Sinking a Wet Shaft. Paper before American Society of Civil Engineers. By J. P. Hogan. Illustrated, 6 pp., Canadian Engineer, May 4. 15 cts.

New Water Supply Tunnel Under New York City. 2-3 p., Engineering News, May 11. 15 cts.

Reinforced Concrete Water Tunnel at Sioux City. Illustrated, 2-3 p., Engineering Record, June 3. 10 cts.

Pumping Plant, Municipal. By T. E. Butterfield. Illustrated, 6 pp., Isolated Plant, June. 10 cts.

Test of a High-Duty Pumping Engine. By R. W. Angus. Illustrated, 1 p., Power, June 13. 5 cts.

Comparative Tests of Large Engines and Turbine-Driven Centrifugal Pumps. By Francis Head. Illustrated, 1-1-3 pp., Engineering News, May 11. 15 cts.

Efficiency and cost of Modern Pumping Engines. Paper before American Society of Civil Engineers. By C. A. Hague. 2 pp., Engineering-Contracting, May 10. 10 cts.

Notes on Designs of Centrifugal Pumps. Paper before Franklin Institute. By M. W. Akimoff. Illustrated, 1 1/2 pp., Canadian Engineer, May 25. 15 cts.

Purity, Standards of. 1 1/2 pp., Municipal Journal and Engineer, June 11. 10 cts.

Pollution Through Water Mains. 1-3 p., Municipal Journal and Engineer, May 10. 10 cts.

Protection of Water Supply. Paper before Society of Engineers. By H. C. H. Shenton. 3 1/2 pp., Surveyor, May 12. 40 cts.

The Red Water Plague. Effort to determine cause of rust in water drawn from faucets; effect of alum treatment; galvanic action; action on iron increased by heat and pressure; remedies suggested. From paper before American Water Works Association. By G. C. Whipple. Illustrated, 6 pp., Municipal Journal and Engineer, June 14. 10 cts.

Esthetic and Commercial Characteristics. 1/4 p., Municipal Journal and Engineer, June 14. 10 cts.

Purification of Drinking Water. By J. L. Leal. Paper before American Water Works Association. 1 p., Fire and Water, June 14. 10 cts.

Modern Methods of Water Purification. By S. Rideal. 1 p., Surveyor, May 26. 40 cts.

Filtration and Purification of Water for Public Supplies. Paper before Institution of Municipal and County Engineers. By Wm. Ransom. 8 pp., Surveyor, May 12. 40 cts.

Multiple Filtration Without the Use of Chemicals. Paper before Association of Water Engineers. By Walter Clemence. 1 p., Surveyor, June 2. 40 cts.

Multiple Filtration. 1/4 p., Municipal Journal and Engineer, June 11. 10 cts.

Construction of Springfield Filters. Paper before Boston Society of Civil Engineers. Illustrated, 6 pp., Canadian Engineer, May 18. 15 cts.

The Rock Island Filter Plant. 2 1/2 pp., Engineering Record, June 3. 10 cts.

Operation of Torresdale Filters and Tests of Schmutzdecke. 1 1/2 pp., Engineering Record, June 3. 10 cts.

Data on the Action of Ejectors for Filter Sand. Paper before New England Water Works Association. By Maurice Knowles. 3 pp., Engineering Record, June 10. 10 cts.

Mechanical Filtration Plant at Cohoes. Illustrated, 2-1-3 pp., Engineering Record, June 3. 10 cts.

Construction of Maiden Creek Slow Sand Water Filters for Reading, Pa. By Mandes Golder. Illustrated, 1 p., Engineering News, May 4. 15 cts.

Louisville Water Works Filters. Illustrated, 1 1/2 pp., Municipal Journal and Engineer, May 31. 10 cts.

Operating Cost and Qualitative Results of Slow Sand and Mechanical Filters, Baltimore County, Md. By S. T. Powell. Illustrated, 2 1/2 pp., Engineering News, May 4. 15 cts.

Sterilization of Water by Ultra-Violet Rays. Paper before Association of Water Engineers. By Max de Recklinghausen. 1 1/2 pp., Surveyor, June 2. 40 cts.

Sterilizing by Ultra-Violet Rays. 1-3 p., Municipal Journal and Engineer, June 14. 10 cts.

Disinfection of Water. Paper before Conference of Ohio Local Boards of Health. By R. G. Perkins. 1 1/2 pp., Engineering Record, May 31. 10 cts.

Apparatus for Applying Chemicals to Water Flowing in Pipes Under Pressure. Illustrated, 1 p., Canadian Engineer, June 8. 15 cts.

Hypochlorite Disinfection of Indoor Swimming Tank at Northwestern University. By W. L. Lewis. 1 p., Engineering News, June 8. 15 cts.

Water Waste Survey in Memphis. Census taken by service districts; consumption registered continuously for a week by pitometer; sources of leakage. Illustrated, 2 pp., Municipal Journal and Engineer, June 14. 10 cts.

Water Meters. The Introduction of, and Water and Health Conservation in New York City. 1 p., Engineering News, June 8. 15 cts.

Water Rate Decision in Illinois. 1 p., Engineering Record, May 13. 10 cts.

Determination of Water Rates for Madison, Wis. 3 pp., Municipal Engineering, June. 25 cts.

Water Rates. Scientific calculation of rate on basis of cost of service; service charge and quantity charge; former regulated by size of service and meter; adequate method of accounting essential. 1 p., Municipal Journal and Engineer, June 14. 10 cts.

Water Works Rate Making. 2-3 p., Municipal Journal and Engineer, June 11. 10 cts.

Fire Hydrant Rates. Rational method of fixing hydrant rates, based upon cost of service; percentage of cost of distribution system chargeable to such service; cost per capita; value of fire protection. From paper before American Water Works Association. By Leonard Metcalf, Emil Kaichling and W. C. Hawley. Illustrated, 6 pp., Municipal Journal and Engineer, June 14. 10 cts. 7 pp., Engineering Record, June 7. 10 cts.

Management Water Works. Paper before Indiana Sanitary and Water Supply Association. By C. H. Hurd. 2 pp., Municipal Engineering, June. 25 cts.

Water Famine in New York City. The Peril of a. What Can Be Done to Avoid It? Illustrated, 3 pp., Engineering News, May 18. 15 cts.

Prepare Now for Water Shortage. ¼ p., Municipal Journal and Engineer, May 10. 10 cts.

New York, Future of Municipal Water Supplies in. Paper before Conference of New York Mayors. By Walter McCulloh. 2 pp., Fire and Water, June 7. 10 cts. Survey, Illinois Water. ¼ p., Municipal Journal and Engineer, June 14. 10 cts.

Notes, Water Works. ½ p., Municipal Journal and Engineer, June 14. 10 cts.

Madison (Wis.) Water Notes. 1-3 p., Municipal Journal and Engineer, May 10. 10 cts.

Questions, Water Works. ¼ p., Municipal Journal and Engineer, May 31. 10 cts.

STREET LIGHTING

Street Lighting Equipment in New York City. By H. T. Owens. Illustrated, 3 pp., Electrical Review, May 27. 10 cts.

Electric Street Lighting. By Albert Scheible. 1½ pp., Electrical Review, May 13. 10 cts. 1½ pp., May 20. 10 cts.

Ornamental Street Lighting a Luxurious Necessity. By C. L. Eshleman. Illustrated, 8 pp., Illuminating Engineer, June. 20 cts.

Illumination, Ratio of Light to. Paper before Illuminating Society of London. By H. P. Harrison. 1½ pp., Electrical Review, June 3. 10 cts.

Fixtures, Development of Street Lighting. By H. T. Owens. Illustrated, 3 pp., Illuminating Engineer, June. 20 cts.

Automatic Street Lighting. 1-3 p., Municipal Journal and Engineer, May 31. 10 cts.

Luminous and Flame Arcs versus Open and Enclosed Carbon Arcs for Street Illumination. Illustrated, 10 pp., General Electric Review, June. 20 cts.

Street Mains and Service Construction Policy. Paper before Southern Gas Association. By K. L. Simons. 1½ pp., Progressive Age, May 15. 20 cts.

Rates, Discrimination in Central Station. By F. F. Fowle. 9 pp., Engineering Magazine, June. 25 cts.

Excessive Rates for Gas and Electric Lighting Through the Operation of a Holding Corporation. 1 p., Engineering News, May 4. 15 cts.

Cheaper Street Lighting in Wichita. ¼ p., Municipal Journal and Engineer, May 10. 10 cts.

Appraisal of Gas Properties in Chicago and Investigation as to Reasonable Rates for Gas. From report by W. J. Hagenah. 12 pp., Engineering-Contracting, May 17. 10 cts.

FIRE AND POLICE

Fire Waste in the United States. Paper before National Fire Protection Association. By W. L. Fisher. 1-2 p., Engineering News, June 1. 15 cts.

Prevention and Control of Fire Through Scientific Methods. Paper before Congress of Technology. By E. V. French. 1 p., Fire and Water, April 26. 10 cts.

Poor Fire Protection at Macon. 1 p., Fire and Water, May 24. 10 cts.

The Fire Prevention Bill of the Merchants' Association, New York. 4 pp., Proceedings, Merchants' Association, May.

Fire Alarm System, Independent. From engineer's report to mayor of Los Angeles. 4 pp., Pacific Municipalities, April 29. 20 cts.

Police Signals and Fire Boxes. 1-4 p., Municipal Journal, May 31. 10 cts.

Fire Boats, Modern Turbine and Electric. Illustrated, 1 1-2 pp., Fire and Water, May 24. 10 cts.

Photographing for the Civic Good. By J. Horace McFarland. Illustrated, 2 pp., Suburban Life, June.

The Art of Roadmaking. By Harwood Frost. New York. Published by the author. 1910. Cloth, 6x9 inches, illustrated, 544 pp. Price, \$3.

The author, an editor by profession who is accustomed to dealing with engineering topics, states that his object in writing the book is to give in a style suitable for the non-technical reader an exposition of the technical and financial problems involved in road-making and paving. It should not be assumed, however, that the book is of no value to the engineer. The contrary is the case, for the descriptive portions dealing with more recent styles of construction are not so well presented in any text books, although the reader who keeps posted on current technical magazine literature may

not find much that is novel to him. The topics dealt with in the opening chapters are the conventional introducing ones, resistance to traction, road and pavement economics, and the principles underlying the selection of pavements for different purposes. These chapters constitute Part I of the book. The second part deals with country and suburban roads, and the third with city streets and pavements. The second part is that which will perhaps be the most read, because it deals with a topic of great general interest. The location of roads with a view to securing suitable grades and other factors is given a chapter. Construction and protective works, in which the importance of drainage is clearly brought out, are given a chapter, together with a brief discussion of highway bridges and retaining walls. The agencies, chemical, physical and mechanical, which cause the destruction of roads, are explained in connection with an enumeration of road building materials and their relative values. Earth, gravel, sand and clay roads, are described at considerable length, and broken stone roads are given a separate chapter. The chapters on road maintenance and dust prevention contain many practical instructions. Under the caption "State Aid Laws" there are included extracts from a number of State specifications. chapter contains information not easily accessible, at least in one volume. In the third part of the book specifications, methods of construction and costs of stone block, brick, wood block, asphalt and concrete are discussed, and the merits and defects of each kind of pavement are pointed out fairly and impartially. Modern methods of street cleaning, including flushing, are described, and even the treatment of the roadside, the selection of trees, is not forgotten. In general, it may be said that the author has accomplished his stated purpose, and the book should prove valuable to officials in charge of roads and citizens generally interested in the subject of roads and pavements who may not have had the advantage of a technical education. When it is borne in mind that the responsibility for the selection of road and street pavements rests generally on those who are assessed for it, the number to whom the book appeals is not few. The illustrations are well selected, with a view to bringing out practical points treated of in the text.

Practical Talks on Contracting. Being reprints from the Contractor of valuable papers by Frank B. Gilbreth, C. A. Worden and E. S. Hanson, Chicago: Contractors' Publishing Company, 1910. Cloth, 5 1/2 by 9, 128 pp. Price, \$1.50.

The leading paper in this series concerns the systematizing of a contractor's office. From this it need not necessarily be inferred that the book is of no value to the large number of contractors who have their offices under their hats. In the short space of 128 pages it is scarcely possible to establish rules by which all contractors may make a lot of money. However, as one good idea might be worth the price of the book and the hour or so necessary to read it, we can conscientiously recommend the book to both large and small contractors. As having a bearing on the general subject of contractors' accounting, an incident may not be amiss. A superintendent for a large contracting company, which had one of the best systems of reporting and accounting, went into business for himself. His foremen make no daily reports and his bookkeeper and cashier spends most of his time acting as a plant foreman. It seems to the reviewer that this contractor is making a mistake, although the contractor is a man of wide

experience and marked ability. The advent of the automobile, however, has something to do with the question. A superintendent or contractor can now give personal attention to work to an extent hitherto unknown, therefore he need not depend so much on reports.

The captions of the papers give a good idea of the scope of the work. They follow: Systematizing a Contractor's Office. Organization—How to Effect and Maintain It. Between Profit and Loss. Office System for Construction Work. Liability Insurance for Contractors. Important Things to Consider in Estimating. Purchasing Records for Contractors. Tools and Equipment Records. Contractor's Daily Reporting System. Earthwork Records. The Operation of Camps and Commissaries. How Contractors Use Photography.

Bricklaying System. By Frank Gilbreth. New York and Chicago. The Myron C. Clark Publishing Co. Cloth, 6 by 9 inches, illustrated, 321 pp. Price, \$3.

As the author states in his introduction the art of bricklaying is thousands of years old, and during this time the bricklayer has not had to compete with machinery. The knowledge of the art has been handed down from journeyman to apprentice for generations. The purpose of the author is to put this knowledge in print that it may assist the apprentice and enable him to become a proficient workman in the shortest possible time. Besides this the author has introduced some ideas of his own, the result of long study of the motions ordinarily made by a bricklayer. His claim is that by making these motions as simple as possible a greater speed in laying brick may be attained without any greater exertion required by the old ways. The meeting on the same piece of work in the United States of men who learned the trade in different countries has done much to show the best methods and eliminate the slow ones. In the course of the volume, every detail of bricklaying seems to be gone into minutely, with matters of economy always in view. The chapters on motion study and their application to the subject in hand will doubtless be of most interest to the reader who is not a bricklayer.

Shade Trees in Towns and Cities. By William Solotaroff. Octavo, cloth; 280 pages; illustrated. John Wiley & Sons, New York. Price, \$3 net.

The author of this work is Secretary and Superintendent of the Shade Tree Commission of East Orange, N. J., and has written many articles on the general subject of shade trees, several of which have appeared in "Municipal Journal," and is a recognized expert on the subject. The scope of this book is indicated by the sub-title, "Their selection, planting and care as applied to the art of street decoration; their diseases and remedies; their municipal control and supervision." Not the least valuable part of the work are the illustrations, practically all of which are from photographs taken by the author to illustrate the various trees, both their general appearance and their leaves and fruit; injuries and diseases; injurious insects; methods of pruning, surgery, etc. The information given is that needed by shade tree superintendents and thoroughly covers the ground. Much of it is not readily accessible elsewhere, or only in scattered volumes. It should also be of value to the private owner who has shade trees on street or lawn. The final chapters are arguments for city control of shade trees and a summary of the legislation of the several States on the subject. The book can be commended as thoroughly reliable.

INDUSTRIAL NEWS

Cast Iron Pipe.—Chicago: Prices continue firm. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: Shipments continue fairly satisfactory. It is reported that a foundry that has been idle thus far this year will likely change hands at an early date, with a view of its being put in operation. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, \$21. New York: Considerable inquiry has sprung up from the general trade. Quotations: 6-inch, car-loads, \$21 to \$22.

Lead.—Market is stronger. Quotations: New York, 4.45c; St. Louis, 4.30c.

Crushing Ashes and Rubbish.—Knowles & Co., Boston, Mass., the contractors for reclaiming objects of value from the rubbish collected by the Public Works Department of Boston, have installed a No. 3 Gardiner crusher at their plant at the west end of Massachusetts avenue. Objects of value, as heretofore, are picked out and the remaining rubbish, including paper, tin cans, bottles, etc., are crushed up together with ashes and the product used for filling land.

Auto Engine Test.—Chairman J. Ross Bowdre, Macon, Ga., is greatly disappointed over the showing made to date by the new LaFrance auto chemical engine. This was purchased at the same time as the two new Webb machines and arrived several weeks ago. It has failed to give satisfactory service and seems to be in such poor shape that the company has been requested to send an expert to repair it. The two Webb auto engines are doing fine work whenever called upon. The Webb chemical is expected next week. If the LaFrance chemical ever performs satisfactory work and just as soon as the new Webb chemical arrives the South Macon and Vineville fire houses will be equipped.

Annual Report.—The annual report of the Westinghouse Electric & Manufacturing Co. for the year ending March 31, 1911, shows gross earnings of \$38,119,312 and manufacturing and selling expenses of \$32,510,547, leaving a net manufacturing profit of \$5,608,765. An income of \$1,515,532 was also received from interest, discounts, dividends, royalties and other sources, making a total income of \$7,124,297. The expenditures for interest, depreciation and other charges were \$2,243,191, leaving a surplus of \$4,881,106 for the year, which was the largest in the company's history as respects both gross earnings and net income. The directors believe, however, that the volume of business now offering is on a diminishing scale and that the results of the last year are no certain indication of a continuance for the future of gross earnings and net profits such as the past 12 months have produced. Another condition affecting profits is the expiration of the patent agreement between the Westinghouse and General Electric companies, which expired April 30, 1911, and will probably not be renewed; the patent agreements with other companies have been canceled because they might be considered in violation of the anti-trust laws. For these and other reason the directors decided to pass dividends on the ascending stock.

Asphalt Macadam Roadways.—The American Asphaltum and Rubber Co. have published in pamphlet form a paper called Asphalt Macadam Roadways and the Success of the Penetration Method of Applying Binder, read at the annual meeting of the Michigan Engineering Society at Lansing, January 12, 1911. The paper gives a description of a suitable binder, defining the specific gravity, melting point and other properties. Taking up the question of thickness of bituminous material the fallacy of the argument that four inches of bituminous material is twice as good as two inches is exposed. The increase in cost is not accompanied by a corresponding increase in durability and a thickness of two inches is considered as sufficient. The question of quality and grading of stone is taken up and a size varying from 1¼ inch to 2½ inch in the largest dimension advocated. The necessity of proper rolling before the binder is put on is explained. The methods of applying binder are discussed and the use of an ordinary 500 gallon heater and ordinary pouring cans advocated for small work at least. Good advice to the contractor is given regarding such details as heating the binder, putting on top dressing, applying paint coat and brooming. A complete copy of specifications for asphalt macadam roadways, penetration or pouring method is added.

Concrete Bridge Patents.—The National Bridge Company, of Indianapolis, Ind., now owns 17 Lutten patents on cost-saving devices in concrete bridges. Forty-seven other applications for Lutten patents are still pending. Several of the above patents have been declared valid in the United States Circuit Courts with injunctions issued against infringers and numerous other suits for infringement are being filed. The National Bridge Company now announces that in the future as in the past all Lutten patents will be available to any contractor as a license on prepayment of a fixed royalty; that infringers who have infringed in the past will not in general be prosecuted for such past infringement; but when an effort has been made by licensees of this company to secure consideration of plan designed by Daniel B. Lutten, consulting engineer, and the award has been made to other contractors, on plans embodying features of the Lutten patents, that then a suit for an injunction will be filed against the infringing contractor.

New Police Alarm System.—The new signal phone police alarm system at Mishawaka, Ind., installed by the Signal Phone Company of Milwaukee, is now complete and in operation. The numbers of boxes are as follows: 4, Main and Second streets; 5, Second and Smith; 6, West and Seventh; 7, Eighth and Main; 21, Joseph and Main; 22, Margaret and Lawrence; 24, Battell; 25, Joseph and Cedar streets; 26, Union and Fourth; 32, Merrifield avenue and Second street. Flashlight and bells will be used at Sixth and Main, Wells and Second, Cedar and Second, Sixth and Main, Joseph and Battell and Battell and Main. E. E. Salisbury, for the company, gave the final touches to the system for a final test. The system is now in use under the direction of Chief of Police Harvey Frick.

Consulting Engineers.—Messrs. Rudolph Hering and George W. Fuller, hydraulic engineers and sanitary experts of New York City, announce the termination of their ten-year partnership agreement under the firm name of Hering & Fuller, excepting as to certain existing engagements which they as a firm will complete. For all new engagements they will hereafter conduct independent offices at their present address, 170 Broadway, New York.

Messrs. Rudolph Hering and John H. Gregory announce that they have entered into partnership as consulting engineers and sanitary experts, with offices at 170 Broadway, New York City, and will conduct an engineering business covering investigations, reports, designs and superintendence relating to projects concerning water supplies, water purification, sewerage, sewage purification and refuse disposal.

Auto Fire Engine.—For the second time the Knox gasoline propelled and gasoline pumping fire engine and hose wagon, with which the New York Fire Department has been experimenting, failed last week, this time ceasing to operate at Twenty-second street and Coney Island boulevard, Brooklyn, while undergoing a test for speed. It had started out from the repair shops at Fifty-sixth street and Eleventh avenue, Manhattan. Battalion Chief Howe, Capt. Demorest of the Bureau of Repairs and Supplies, and Capt. Henry, the supervising engineer of the Fire Department, were following the engine in another machine. Under the contract terms the engine was to pump 700 gallons of water for three hours. Two weeks before a test of her pumping capacity was given at the repair shops in Manhattan. After pumping for seven minutes the machine caught fire and the test was abandoned.

Imhoff Patents.—The Pacific Flush Tank Company, Singer Building, New York, N. Y., and The Temple, Chicago, Ill., announce that they have become the American representatives for the patents covering the Imhoff tanks for sewage treatment.

Corporation Election.—Westinghouse, Church, Kerr & Co., New York, announce that John F. Wallace has been elected president of the company.

Mueller Sewer Rod.—H. Mueller Mfg. Co., Decatur, Ill., have placed on the market a steel sewer rod for use in opening clogged sewers. The rod is flexible enough so that it can be carried about in a coil, yet stiff enough to do the required work. It is a continuous strip of special spring steel; its flexibility will allow it to follow irregularities in the line of the sewer. However, it has enough strength and spring to keep it from buckling or breaking. When it is withdrawn it becomes a straight steel rod that can be readily coiled as it is taken from the sewer.

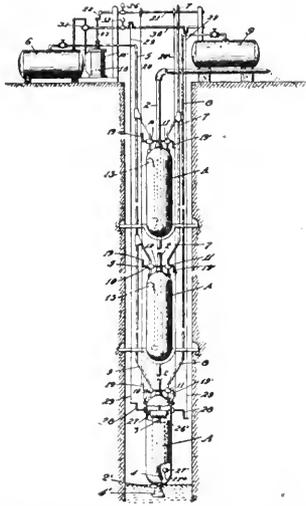

The working end is provided with a sharp spear point which will easily penetrate any obstruction in the passage. Just back of the point there are a number of tacks bent outward but projecting backward from the spear point so that they will not interfere with the penetration of the rod. By working the rod back and forth obstinate stoppages may be torn loose.

The Mueller sewer rod is furnished in lengths of 25, 40, 50, 60, 75 and 100 feet. Rods of all these lengths for use in 8-inch and smaller sewers are made of ½ x 1¼-inch steel. Rods 75 and 100 feet long for use in sewers larger than 8 inches are made of ½ x 1½-inch steel.

PATENT CLAIMS

995,248. DEEP-WELL PUMP. Peter J. Gildea, San Francisco, Cal. Serial No. 564,469.

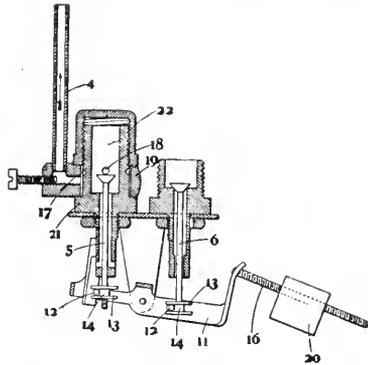

An apparatus to raise liquids, said apparatus comprising a series of superposed spaced cylinders or receivers, with connecting pipes and check and foot valves, means to fill the lowermost cylinder, connections through which air under pressure is intro-

duced above the surface of the liquid to force the liquid successively from each cylinder to the one above, a valve-controlled air supply to said pressure connections, and means controlled by the level of the liquid in a cylinder for opening the air supply valve to admit air to said pressure connections.

994,140. GAS LIGHTING AND EXTINGUISHING APPARATUS. Edmund H. Elton and Richard Stephens, Cleveland, England. Serial No. 476,411.

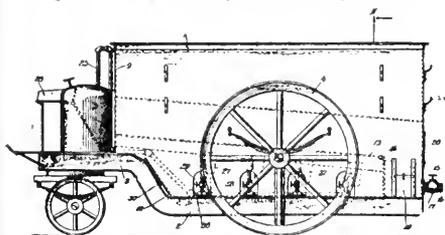

Apparatus for lighting and extinguishing gas burners from a distance comprising main and pilot burner valves, a lever in connection with said valves, an adjust-

able weight on said lever, a diaphragm, and means permitting of retaining the main burner valve open on a slight decrease of gas pressure comprising a pivotally mounted lever on said lever means limiting the rocking movement of said second lever and means connecting the second lever to the diaphragm.

994,579. SNOW-MELTER. Christian Eberstaller, Roselle, N. J. Serial No. 557,748.

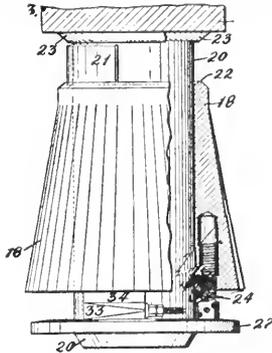

A snow melting apparatus comprising an outer main body or receptacle, an inner snow receiving receptacle of sufficiently less cross sectional area and less depth to provide lateral space and space below

the bottom of said snow receiving receptacle, said inner receptacle having a depending extension forming a well below the plane of the bottom of said inner receptacle, at its rear end, and means for heating the bottom of said inner receptacle.

995,044. HEAD-ADJUSTING DEVICE FOR GYRATORY STONE-CRUSHERS. Edgar B. Symons, Milwaukee, Wis., assignor to Smith & Post Co., Milwaukee, Wis., a Corporation of Wisconsin. Serial No. 535,227.

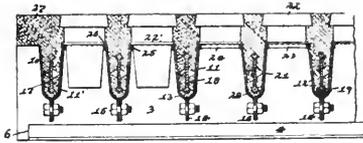

In a rock crusher, a crusher shaft, shoulders projecting from said shaft, a crusher head slidable along said shaft, re-

movable distance collars in halves spacing said head from one shoulder and a screw tapped into the head and reacting against the other shoulder for holding said head and collars up to said shoulder.

994,540. MOLD FOR FORMING SIDEWALKS AND OTHER LIKE CONSTRUCTIONS. Henry C. Seipp, Coraopolis, Pa. Serial No. 550,213.

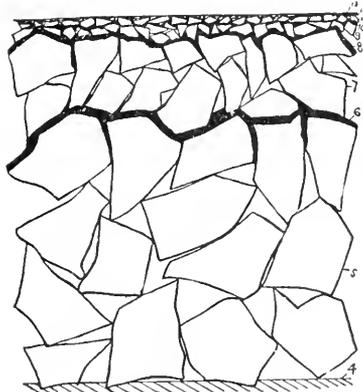

In a mold for forming sidewalks and other like constructions, the combination with re-

movable supporting means, of a vertical slotted mold forming plate on said means, and a removable mold section of trough-shaped form on said plate.

995,147. COMPOSITE PAVEMENT. Harry G. Jennison, Toledo, Ohio. Serial No. 538,348.

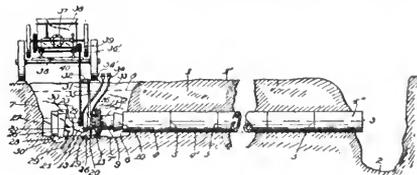

The combination in a pavement of a base, a hydrocarbon binder thereon, a wearing layer wholly of road metal anchored by said binder, said layer having unfilled voids, and a hydrocarbon binder covering said

road metal layer and spaced from said anchor binder, the quality of binder being gaged to preserve cushioning effect of the unfilled voids in road metal layer upon laying to thereby confine hydrocarbon binders to serve only as binders.

995,404. MEANS FOR CLEARING OBSTRUCTED DRAIN-PIPES. Artemus N. Hadley, Indianapolis, Ind. Serial No. 435,548. Divided. Serial 515,186.

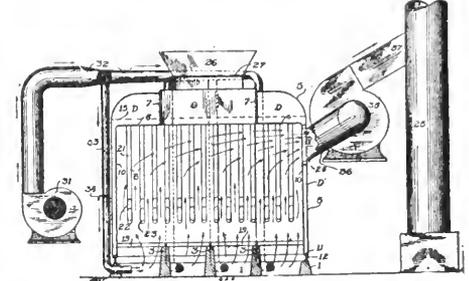

Apparatus for clearing a drainage pipe line embedded in the ground, including a water-delivering machine provided with a

delivery end adapted to be placed unattachably to the end of a section of the pipe line, and means independent of the pipe line for holding the delivery end forcibly in contact with the end of the section.

994,636. GARBAGE-INCINERATING AND STEAM-GENERATING SYSTEM. Charles A. Byrne, Minneapolis, Minn., assignor of one-half to Frank Dunning, Osseo, Minn. Serial No. 535,034.

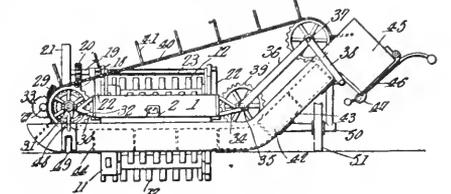

An apparatus for incinerating garbage comprising in combination, a single combustion chamber having an outlet, a fire grate therein, means supplying forced draft to said grate, positive mechanical means

communicating with said outlet for maintaining an induced draft, and means in said chamber for suspending the garbage over and closely adjacent the grate at a point between the grate and the outlet whereby products of combustion from the grate penetrate and pass through the garbage.

994,746. DITCHER AND GRADER. Robert E. Raynes, Spencer, N. C. Serial No. 565,793.

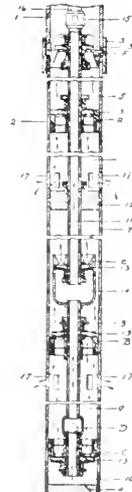

In a ditching machine, a journaled rotor having at its periphery radially disposed bits, a shaft journaled at the side of the rotor and operative from the same, a cam carried by said shaft, a pivoted arm at one end located in the path of movement of the

cam, a scraper carried by said arm and at times located in the path of movement of the bits, the parts being so arranged that the cam engages the arm and swings the same so that the scraper is carried beyond the path of movement of the bits as the bits approach the same.

994,310. DEEP-WELL PUMP. James Gleason, Green Bay, Wis. Serial No. 577,122.

In a deep-well pump a suspension pipe, a pump cylinder attached thereto, said cylinder closed at the lower end, a diaphragm in said cylinder dividing the working space into two approximately equal parts, a diaphragm valve between the cylinder and the suspension pipe, two rows of ports in the sides of said cylinder opening into the two working spaces, a sucker rod, a hollow pump rod open at its lower end, and

connected to the pump rod with a coupling having open port holes, a downwardly opening bucket at the lower end of the pump rod, a ball valve in said pump rod above the lower bucket, an upwardly opening bucket attached to the pump rod in the lower working section of the cylinder, a cage valve on said pump rod above the upwardly opening bucket, an upwardly opening bucket attached to said pump rod above said diaphragm in the upper working space of said cylinder, as set forth.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Ohio	Cincinnati	June 23, noon	Repairing portion of Blue Rock pike; also for oiling Colerain pike in Colerain twp. and Cleves and Bridgetown pike in Green and Miami townships.	Stanley Struble, Pres. Bd. Co. Comrs.
Dist. of Col.	Washington	June 23, 2 p.m.	Laying gutters and bituminous macadam pavement and setting curb on various streets.	C. H. Rudolph, Chm. Commissioners.
Pennsylvania	Pittsburg	June 23, noon	Furn. 5,000 bbls. of Portland cement during nine months ending March 31, 1912.	J. R. Cunningham, County Compt.
Ohio	Rocky River	June 23, noon	Constructing cement walks on North Ridge Road.	W. M. Dean, Town Clerk.
Ohio	Youngstown	June 23, noon	Repairing sheet asphalt streets; and paving portion of Myrtle av.	W. H. McMillin, Clk. Dept. Pub. Ser.
Ontario, Can.	Kingston	June 24, noon	Constr. 15,000 sq. yds. of asphaltic macadam; and 9,700 lin. ft. curb and gutter.	H. B. R. Craig, City Engineer.
Ohio	Bowling Green	June 24, 2 p.m.	Grading, draining, macadamizing and oiling Wallace avenue.	W. A. Mariner, Service Director.
Massachusetts	Holyoke	June 26, noon	Constr. about 5,200 sq. yds. granite block or brick pavement.	Board Public Works.
Iowa	Maquoketa	June 26, noon	Paving with brick blocks, creosoted block & asphaltic concrete various streets.	E. J. Kullmer, City Clerk.
New Jersey	Plainfield	June 26, 8 p.m.	Paving about 40,000 sq. yds. with plain and bituminous.	Jas. T. MacMurray, City Clerk.
Nebraska	Lincoln	June 27, noon	Paving portions of roads Nos. 667 and 1225, 9,564 sq. yds. Class "C" and "G"; 10,760 lin. ft. artificial stone curb.	H. E. Wells, County Clerk.
Ohio	Lorain	June 27, noon	Improving various streets and alleys by paving with macadam, sheet asphalt, block asphalt or vit. brick, with necessary excavation, draining, curbing, foundations, etc.	L. B. Johnson, Clk. Dept. Pub. Serv.
New York	Buffalo	June 27, 11 a.m.	Paving and repaving various streets.	Francis G. Ward, Comr.
Maryland	Havre de Grace	June 27, 8 p.m.	Improving certain streets, consisting of about 5,160 cu. yds. excavation; 8,480 sq. yds. bituminous macadam; 120 cu. yds. masonry.	Murray Vandiver, Chm. Imp. St. C.
Virginia	Norfolk	June 28, noon	Constructing new highways in Wise county.	State Highway Com.
Tennessee	Wise Ct. House	June 28, 11 a.m.	Constructing about 81 miles of county highway.	Bd. Superv. Wise County.
Ohio	Columbus	June 28, noon	Furnishing and applying 10,489 gals. surface treatment on Harrisburg Pike; 15,739 gals. on Sunbury Pike and 13,630 gals. on National Road.	John Scott, Clk. Bd. Co. Comrs.
Ohio	Lowellville	June 28, 2 p.m.	Improving three roads in Mahoning township.	W. J. Maurice, Township Clerk.
California	Sacramento	June 28, noon	Constr. 14 miles of Trinity State Highway.	N. Ellery, State Engineer.
Pennsylvania	Greensburg	June 29, 11 a.m.	Construction and permanent improvement of four county roads about 68,348 feet.	J. D. Miller, Chm. Co. Comrs.
Ohio	Cincinnati	June 30, noon	Treating with tar Hillside ave. and Warsaw pike; oiling Springfield pike in Springfield township.	Stanley Struble, Pres. Bd. Co. Comrs.
Arkansas	Little Rock	June 30, noon	Paving about 13,000 sq. yds. with creosoted block; 25,000 sq. yds. of macadam.	E. A. Kingsley, Engineer.
Arkansas	Argenta	June 30, noon	Constr. about 30,000 sq. yds. creosated block pavement; 25,000 sq. yds. macadam.	Mayor Faucette
Kentucky	Middlesboro	July 1, noon	Constr. sidewalks, curb. and guttering in various streets.	E. S. Helburn, Mayor.
Georgia	Rome	July 1, noon	Grading, curbing and paving various streets with wood block vit. brick, Hassam, asphalt macadam, sheet asphalt and bitu.	J. R. Cantrell, City Clerk.
Indiana	Greencastle	July 1, noon	Constr. about 40,000 ft. of macadam road in Putnam County.	D. V. Moffett, County Auditor.
New Jersey	Westfield	July 3, 8:15 p.m.	Constr. about 3,200 sq. yds. bituminous macadam pavement, concrete culverts, drains and appurtenances; 1,000 cu. yds. ex.	Chas. Clark, Town Clerk.
West Virginia	Parkersburg	July 3, noon	Paving with brick portions of 4 roads in Wood County.	C. S. Skidmore, County Engineer.
New York	Olean	July 5, 8 p.m.	Constr. about 9,800 sq. yds. of wire-cut-lug block pavement; 6,000 lin. ft. stone curbing.	John H. Gaynor, Engineer.
Florida	Tampa	July 5, 2 p.m.	Resurfacing about 1½ mile road in Hillsboro County with shellor its equivalent.	Bd. County Comrs.
Indiana	Vincennes	July 5, 2 p.m.	Constr. about 93,400 ft. of gravel roads in Knox County.	John T. Scott, County Auditor.
West Virginia	Huntington	July 6, 1 p.m.	Paving various streets with vit. brick, asphalt, bitulithic, tarvia or asphalt block.	A. B. Maupin, City Engr.
Oregon	Grants Pass	July 6, noon	Constructing 30,000 sq. yds. of pavement.	F. E. Hobson, City Engineer.
Mississippi	Meridian	July 6, 2 p.m.	Constr. 12.35 mi. Novaculite roadway; 2 mi. sand-clay road.	W. P. Moore, Chief Engineer.
New York	Olean	July 6, 8 p.m.	Constr. about 5,000 sq. yds. wire-cut-lug block pavement on concrete foundation; 3,500 lin. ft. stone curb.	John H. Gaynor, Engineer.
Illinois	Denison	July 6, 2 p.m.	Constructing various macadam roads.	Geo. Gray, Comr. Highways.
Ohio	Cincinnati	July 7, noon	Oiling Harrison pike in Harrison and Whitewater townships; also repairing Indian Hill avenue in Columbia township.	Stanley Struble, Pres. Bd. Co. Comrs.
North Carolina	High Point	July 10, 1:30 p.m.	Grading, curbing and macadamizing various streets, estimated cost \$40,000.	Fred N. Tate, Mayor.
Iowa	Greenfield	July 11, 2:30 p.m.	Constr. about 14,000 sq. yds. brick or cement paving; 4,500 lin. ft. curb; Iowa Engeer. Company, Chase Block, Clinton, Iowa, Engineers.	Town Clerk.
Ohio	Greenville	July 15, noon	Constructing the Althoff road in Patterson township.	Bd. County Comrs.
Tennessee	Johnson City	July 20, 6 p.m.	Constr. 23,000 sq. yds. paving, including bridges, sewers, storm water drain, concrete curb and gutter, consisting of about 5,000 cu. yds. excavation; 23,000 sq. yds. paving; 12,000 lin. ft. curb and gutter.	W. M. Dunlap, City Comr.
SEWERAGE				
Connecticut	South Norwalk	June 25, noon	Laying 925 lin. ft. of 18-in. and 750 lin. ft. of 12-in. vit. pipe sewer with appurtenances.	Samuel W. Hoyt, Jr., City Engineer.
South Dakota	Aberdeen	June 26, noon	Constr. about 1,860 ft. of 18 and 8-in. pipe sew. and 5 manholes.	F. W. Raymond, City Auditor.
Iowa	Nevada	June 26, 7:30 p.m.	Constr. sewage disposal plant consist. of septic tank; 2 filters & about 3,060 ft. of 15-in. vit. sewer and 730 ft. of 15-in. concrete sewers on piers with manholes; also constr. 1,480 ft. of 12-in., 5,920 ft. of 10-in. & 27,090 ft. of 8-in. vit. pipe sewers.	City Clerk.
Rhode Island	Woonsocket	June 27, 4 p.m.	Constr. about 900 ft. of 8-in. sanitary sewer and appurtenances and about 500 ft. surface water drain.	Frank H. Mills, City Engineer.
North Carolina	Red Springs	June 27, 3 p.m.	Constr. a sewer system including 4½ miles of 8 to 15-inch pipe.	A. B. Pearsall, Chm. Bd. Pub. Wks.
Minnesota	Morris	June 27, 8 p.m.	Constr. 3,232 ft. of 8-in. sewer, 4-in. tile drain, manholes, flush tank, etc.	C. B. Burpee, City Clerk.
New York	Hempstead	June 27, noon	Bldg. about 122,930 lin. ft. 8 to 20 in. vit. pipe, about 2,000 lin. ft. 8 to 18-in. cast iron pipe, about 115,300 cu. yds. excavation, 3,000 vert. ft. concrete manholes, 113 flush tanks, 445 manhole covers, 18,000 lin. ft. 6-in. vit. pipe for house service, two pumping plants and one disposal plant.	M. O. Hedges, Clk. Vil. Bd.
Maryland	Baltimore	June 28, noon	Constr. storm water sewers in the bed of Jones' Falls, preliminary to constructing boulevard over Falls.	J. H. Preston, Mayor.
New York	Binghamton	June 28, 4 p.m.	Laying vit. pipe sewer with necessary manholes, catch basins, flushing tanks, and connections, in Union, Brace and Berlin sts.	S. W. Murray, Clk. Bd. C. & Sup.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
SEWERAGE (Continued)				
New York	Hudson	June 29, 6 p.m.	Constr. 10-in. vit. tile sewer on Green street	M. J. O'Hara, City Engineer.
Wisconsin	Independence	June 29, 8 p.m.	Constr. sewers consisting of 10 lin. ft. of 30-in. steel pipe; 1,089 lin. ft. 24-in. vit. pipe; 1,251 lin. ft. 20-in. vit. pipe; 1,254 lin. ft. 15-in.; 1,200 lin. ft. 12-in., with house connections, and appurtenances.	Jacob Jackson, Village Clerk.
Ohio	Bucyrus	June 30	Constr. 7,700 lin. ft. of 10 to 20-in. vit. tile sanitary sewer; 6,700 lin. ft. of 4 and 5-ft. concrete and brick sewer.	F. L. Niederheiser, City Engr. E. L. Williams, City Clerk.
Wisconsin	Appleton	June 30	Constructing sewer in portion of Lawrence Street	
Utah	Salt Lake City	June 30	Extending gravity outlet sewer from present outlet to Great Salt Lake	H. G. McMillan, Chm. Bd. Pub. Wks.
Kansas	Parsons	July 1	Constr. sewers of double strength vit. pipe with septic tank of concrete and pumping station. Est. cost \$65,000 to \$70,000.	City Clerk.
California	San Jose	July 3	Construct septic tank for County hospital	City Clerk
South Dakota	Madison	July 6, 8 p.m.	Bldg. sewer system about 31,465 lin. ft. 6 to 18 in. vit. pipe	George H. Waskey, Mayor.
North Carolina	High Point	July 10, 1:30 p.m.	Constr. sewer and water lines amounting to about \$50,000	Fred N. Tate, Mayor.
Ohio	West Lafayette	July 10	Constructing storm water sewers. Est. cost \$16,000.	E. L. Thompson, Village Clerk.
WATER SUPPLY				
Arkansas	Mena	June 23	Constr. new distribution system for water works Dist. No. 2; separate bids for material and construction; 780 tons c. i. pipe and special castings; about 30,000 ft. of 4 to 12-in. mains	John Thompson, Chm. Bd. Imp. Dexter Brackett, Chm. Engr. W. Wk. D. Donohue, City Clerk.
Massachusetts	Boston	June 23	Laying about 10,200 ft. of 24-in. c. i. water pipe in Hyle Park av.	
Minnesota	North Mankato	June 24, 7:30 p.m.	Furn. and install. pump. equip. for village water works	
Minnesota	Paynesville	June 24, 2 p.m.	Extending water mains, consisting of 3 blocks of 8-in. main with hydrants and connections	Frank Tolman, Village Clerk.
Ohio	Euclid	June 26, noon	Laying 6-in. water mains in four avenues	F. H. Schoaff, Village Clerk.
New York	Newburgh	June 26, 5 p.m.	Laying about 1,000 ft. 30-in. water main	Curtis Stanton, Supt. Water Works.
Pennsylvania	Aliquippa	June 26	Constr. brick pump house, laying c. i. water lines and connecting 1,184,000 single action triplex power pump.	W. W. Lester, Boro. Clerk.
Massachusetts	Lynn	June 27	Constr. pumping station and machinery for pumping water from Saugus River to Hawkes Pond	Ulman R. Hunt, Supt. Bldgs.
Michigan	Imlay City	June 27, noon	Wrecking old and constr. new standpipe on brick tower; and furn. c. i. riser pipe with connections complete	Horace Lamb, Pres. Bd. Trustees.
New Jersey	Bridgeton	June 27	Constructing complete pumping station and water filtration works, machinery, pumps, fillers, etc.	J. J. Jones, City Clerk.
Kentucky	Frankfort	June 27, 11 a.m.	Constr. pipe line to Lakeland, consisting of 7,360 ft. 16-in. pipe, 21,680 ft. 12-in. pipe, 10,690 ft. 8-in. pipe	Albert Scott, Pres. Ken. St. Bd. Con.
Tennessee	Dyer	June 27, 2 p.m.	Furn. material for constructing water works; consisting of 60-H.P. gasoline engine; 150,000 gal. reservoir; 40,000 gal. steel tank on 50-ft. tower; brick or concrete pumping station; water pipe, valves, etc.	R. B. Daniel, Mayor.
Maryland	Baltimore	June 28, 11 a.m.	Furn. a 30,000,000 gal. vertical triple expansion pumping engine, two batteries and two boilers each and appurtenances	Alfred M. Quick, Water Engineer.
Quebec, Can.	Montreal	June 29, noon	Installing pumping machinery, blower and cranes at filtration plant	L. N. Senecal, Secy. B. I. Comrs.
North Dakota	Mandan	June 29, 2 p.m.	Laying c. i. water pipe and appurtenances, constr. power house intake, intake well, settling basins, clear water well etc.; furn. boilers; hydrants, valves, c. i. pipe and special castings	Lee Nichols, City Auditor. Henry N. Knott, City Clerk. Village Clerk.
Minnesota	Minneapolis	June 30	Furnishing filter equipment and devices	John Wilson, City Engineer. City Clerk.
Nebraska	Bridgetown	June 30	Constr. water works system. Est. cost \$17,500.	H. H. Canfield, City Clerk.
Ontario, Can.	Ft. William	July 1	Selling equipment of municipal pumping and electrical generating plant, suitable for town of 5,000 inhabitants	E. L. Callison, Supt. Road Co. Thomas Hamon, City Clerk.
Illinois	Mendota	July 3, 7:30 p.m.	Constr. an iron and concrete roof on reservoir	W. D. Welsh, Mayor. City Clerk.
Ohio	Cleveland Hghts.	July 5, noon	Building 10-in. water main in Cedar Roads	L. N. Senecal, Secy. Bd. Comrs.
Louisiana	Kentwood	July 6	Drilling artesian well	
Nebraska	Columbus	July 7, 8 p.m.	Constructing and installing a water works extension	
Quebec, Can.	Montreal	July 13, noon	Constr. final filters and appur. forming por. of filtration plant	
BRIDGES				
Illinois	Clinton	June 23, 9 a.m.	Constr. a reinforced concrete bridge of two 40-ft. girder type spans with an 18-ft. roadway	R. S. McBride, Town Clerk.
Ohio	Cincinnati	June 23, noon	Constr. bridges, culverts and approaches on County Club road in Sycamore, Silverton and Columbia townships	Stanley Struble, Pres. B. I. Co. Comrs.
Virginia	Rocky Mount	June 24	Constr. two bridges in Franklin County, of iron	J. H. Ferguson, Chm. Bridge Com.
Tennessee	Knoxville	June 24, 9 p.m.	Rebuilding and repairing timber bridges in Knox County	E. L. Callison, Supt. Road Co.
Pennsylvania	Erie	June 26, 8 p.m.	Reconstructing and repairing the 26th St. bridge over Mill Creek	Thomas Hamon, City Clerk.
Washington	Tacoma	June 26, noon	Constr. new bridges on 11th st. Separate bids on (1) substructure; (2) entire bridge except steel work, electrical and other machinery; (3) Furn metal work, electrical equipment; (4) Erecting superstructure; (5) Constr. bridge complete, removing old bridges constr. temporary bridge	City Clerk.
Ohio	Cleveland	June 28, 11 a.m.	Constr. a concrete bridge in Euclid township	John F. Goldenbogen, Clk. B. C. C.
Texas	Houston	July 1	Constr. a reinforced concrete viaduct over Houston ship channel about 1,650 ft. long and 60 ft. wide	F. L. Dormant, City Engr. City Clerk.
Pennsylvania	Pittsburg	July 1	Constructing one concrete arch, estimated cost \$85,000.	Jos. Overfield, Clk. B. I. Co. Comrs.
Pennsylvania	E. Stroudsburg	July 3, 11 a.m.	Constructing 4 stone bridges	
Kansas	Leavenworth	July 3, noon	Building Peterson Bridge, Tonganoxie Twp.; bridge on Limit St., Leavenworth; bridge across Little Stranger, High Prairie township	J. A. Hall, County Clerk.
California	San Jose	July 5, 11 a.m.	Constr. a pony truss bridge over Campbell Creek; also reinforced conc. add. to the abut. of Ford Road Bldg. over Coyote Creek	Henry A. Pfister, Clk. B. C. Sup
Ohio	Cincinnati	July 7, noon	Constr. concrete bridge at intersection of German and Compton roads in Springfield township	Stanley Struble, Pres. Bd. Co. Comrs.
Indiana	Richmond	July 8, 11 a.m.	Constr. a 24-ft. concrete span bridge in Green Twp.; an 18-ft. span on the Cart Road North of Richmond; constr. a concrete floor on the Canal Bridge at Hagerstown; constr. concrete crete wall and earth filled approach of the Middleboro Bridge	Demas S. Coe, County Auditor.
New Jersey	Trenton	July 11	Constr. a steel and conc. bridge over Herrontown Rd., Princeton township	Frank J. Epple, County Engineer.
Indiana	Ft. Wayne	July 12, 10 a.m.	Constr. a bridge over St. Joe River, at Tennessee ave.	Calvin H. Brown, County Auditor.
LIGHTING AND POWER				
Wisconsin	Minocqua	June 23, noon	Constr. electric lighting plant, including engine and equipment, reconstr. build. for power house; pole line and wiring	W. H. Fisher, Town Chairman
Sask., Can.	Prince Albert	June 26	Furn. hydraulic power and electrical power equipment	C. O. Davidson, Secy. Treas.
Iowa	Pocahontas	June 27, 4 p.m.	Installing complete electric light plant	Geo. Schneiders, City Clerk.
Arkansas	England	July 1	Building and operating an electric light plant under a 30-year franchise	H. Galloway, Recorder.
Alherta, Can.	Stettler	July 3	Furn. one 125 KVA generator exciter and switchboard; one tandem compound steam engine, boiler, stack, poles, and pole line material; erecting pole line	David Mitchell, Town Clerk.
Australia	Brisbane	Jan. 30, noon	Designs, supply and erection at Mount Crosby Pumping Station of alternatively one, two and three complete units consisting of power generating pumps and plants, etc.	Geo. Johnston, Albert St., S & W. Bd
FIRE EQUIPMENT				
New Jersey	Princeton	July 5	Furn. auto pumping engine	E. M. Uddike, Chm. F. & W. Com.
South Dakota	Gettysburg	July 11, 8 p.m.	Furn. 750 ft. of 2 1/2-in. fire hose; one service hose cart	R. L. Flickinger, City Auditor.

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
MISCELLANEOUS				
Massachusetts	Holyoke	June 23, 2 p.m.	Constructing shelter for public playground	Oscar C. Ferry, Assistant Clerk
Indiana	South Bend	June 26, 10 a.m.	Furn. 50 or more voting machines	John W. Haroon, Attnr.
Ohio	Maumee	June 26, noon	Erecting a village hall building	Geo. V. Raab, Village Clerk
North Dakota	Bismark	June 26, 9 p.m.	Erecting a brick fire hall	R. H. Thistlewaite, City Auditor
Oklahoma	Muskogee	June 27, 10 a.m.	Constr. garbage disposal plant of 35-ton daily capacity	Ernest Cook, Comr. Pub. Safety
New Jersey	Paterson	June 28	Collecting and disposing of garbage and refuse for term of 5 years from July 1	T. S. Standeven, City Clerk
Ontario, Can.	Ft. William	June 30, 5 p.m.	Constructing a reinforced concrete subway	John Wilson, City Engineer
Washington	Spokane	June 30	Constructing additions to country jail. Estimated cost \$40,000	Bd. County Comrs.
Illinois	Mendota	July 3	Constr. an iron and concrete roof on reservoir	City Clerk
Illinois	Gillespie	July 5, 5 p.m.	Constructing new city building	G. W. Schmidt, City Clerk
Indiana	Muncie	July 5	Constructing a new barn at County Infirmary, 40x50 ft.	County Auditor
Louisiana	Mansfield	July 5, 10 a.m.	Erecting a two story and basement, semi-fireproof Courthouse	Parish of De Sota

STREET IMPROVEMENTS

Clanton, Ala.—Chilton County is considering \$150,000 bond issue for road construction.

Argenta, Ark.—Plans are being prepared by E. A. Kingsley, engineer, Little Rock, for paving in districts 11 and 12.

Napa, Cal.—Trustees have ordered the City Engineer to draw up plans and specifications for bituminizing of five blocks of street at a cost of \$6,500.

Yuba City, Cal.—Board of Supervisors has granted the petition of J. W. More and others for a new road in District No. 2.

Colorado Springs, Col.—Specifications have been completed for the paving of downtown district and estimates and assessment lists are now being prepared.

Rockville, Conn.—Council has decided to lay macadam on East Main St.; \$4,000 available.

Washington, D. C.—The Secretary of War and the Chief of Engineers of Army, as members of the highway commission of the District, have finally approved revised plans made by District Commissioners of the system of highways for that portion of the District lying between Mount Pleasant st., Irving st., Adams Mills road, Quarry road and Columbia road.

Jacksonville, Fla.—Duval County will at once pave three miles of the John Anderson boulevard with brick; when work is finished contract will be awarded for three additional miles.

Key West, Fla.—Board of Council has passed ordinances for improvement of about ten streets.

Palatka, Fla.—Freeholders will vote July 11 on \$15,000 loan to complete paving of city with vitrified brick.

Albany, Ga.—Citizens have voted \$12,500 bonds for street paving and \$5,000 to open and lay out new streets.

Oglethorpe, Ga.—Macon County will vote July 20 on \$150,000 bonds for road construction.

Pembroke, Ga.—Bryan County will construct road from Moore's bridge across Canoochee River to King's Ferry bridge, across Ogeechee River.

Waycross, Ga.—Street extensions and subway construction involving several thousand dollars have been authorized by Council, with view of connecting all sections of city and eliminating railroad division now existing.

Muncie, Ind.—Board of Works has decided to pave Franklin st. with brick; bids will be asked.

Vincennes, Ind.—Cost of improving Sixth St. has been estimated at \$6,749.80.

Shenandoah, Ia.—City will construct 24,000 sq. yds. of asphaltic concrete paving this summer. F. L. Cain, City Engineer.

Lafayette, La.—Council has authorized Street Committee to advertise for bids to grade and keep streets and bridges in repair.

Hyattsville, Md.—Council has passed ordinance for improvement of Ralston and Wine aves.

Detroit, Mich.—Bids will soon be asked for paving five alleys at cost of \$30,000. J. J. Hoarer, Commissioner of Public Works.

Monroe, Mich.—Council has decided to pave Washington and North Macomb sts.; cost about \$18,000. J. M. White, City Engineer.

St. Cloud, Minn.—M. J. Cleveland, State Highway Engineer, Stearns County, has completed preliminary survey of State road leading from this city to Maine Prairie and Kimball, and is now working on plans and specifications for improving about 1,300 feet of the road.

Iuka, Miss.—Road Commissioners of District No. 1, Tishomingo County, are considering \$35,000 bond issue for road construction.—R. W. Carter, W. L. Goodman and E. F. Parnell, Road Commissioners.

Jackson, Miss.—Citizens will vote June 29 on \$85,000 bonds for paving streets, etc.—A. C. Crowder, Mayor.

Meridian, Miss.—Board of Supervisors of Lauderdale County have sold \$150,000 good roads bonds of District No. 1 to Union Bank and Trust Company, city.

Wiggins, Miss.—Town is considering \$5,000 bond issue for street improvements.

Excelsior Springs, Mo.—Excelsior Springs Road District of Clay County will vote July 29 on \$150,000 bonds for construction of macadam roads.

Trenton, N. J.—County Engineer Frank J. Epple has completed specifications to be used in resurfacing of Trenton and Lawrenceville Road.

Binghamton, N. Y.—Citizens have voted to construct pavement on Main st.

Brooklyn, N. Y.—Borough President Alfred E. Steers is considering a plan for improvement and widening of Kings Highway; proposed to make the highway 100 ft. wide from Ocean Parkway to Flatbush ave.

Geddes, N. Y.—Citizens have voted \$60,000 to lay out highway from Solvay village to fair grounds, including bridge.

Pittsburg, Pa.—Reconstruction of Troy St. drainage basin to the M. O'Herron Co., \$113,746.

Dallas, Tex.—Furnishing inlet grates for storm sewer work to Mosher Manufacturing Co., \$6.90 each.

Salt Lake City, Utah.—Building sewer extensions Nos. 287 and 248 to Jas. Kennedy Construction Co., \$1.07 and \$1.29 per lin. ft.

Richmond, Va.—To I. J. Smith & Co., Inc., for constructing deep sewer in Broad st., \$6,316.70.

Seattle, Wash.—Building sewers on Ninth ave. N. E., to Krogh & Jessen, 4011 Greenwood ave., \$8,235.89.

WATER SUPPLY

Jackson, Ala.—Citizens will vote July 10 on bonds for constructing water works; if voted affirmatively city will furnish stand-pipe, mains and fire plugs and Bigbee Ice & Development Co. will supply water and pumping power.

Troy, Ala.—Council has ordered extension of sewerage system.

Long Beach, Cal.—Citizens will vote June 27 on municipal ownership of water works.

Oakdale, Cal.—Citizens have voted \$82,000 bonds for construction of water works and sewer system.

Bristol, Conn.—The Bristol Water Co. has decided to increase its capital from \$200,000 to \$300,000 for the improvement and development of storage facilities.

Delmar, Del.—Citizens have voted to install water works.

Milton, Del.—Bids will be received about July 6 for laying three miles of pipe, constructing a 75,000-gallon standpipe, sinking two wells, and constructing a pumping plant; estimated cost, \$14,000. G. E. A. Fairley, 511 Equitable Bldg., Baltimore, Md., Engineer.

Dayton Beach, Fla.—Citizens will soon vote on \$8,000 bonds to install water works system.

Albany, Ga.—Citizens have voted \$12,500 bonds to improve water works and sewerage systems.

Hartwell, Ga.—Water works plans are being prepared by J. B. McCrary Co., 1311 Empire Bldg., Atlanta.

Lavonia, Ga.—Water works plans are being prepared by J. B. McCrary Co., 1311 Empire Bldg., Atlanta.

Tallapoosa, Ga.—Plans are being prepared by J. B. McCrary Co., 1311 Empire Bldg., Atlanta, for water and sewer improvements.

Villa Rica, Ga.—City will construct water works; plans being prepared by J. B. McCrary Co., 1311 Empire Bldg., Atlanta.

Canton, Ill.—City has decided to purchase 2,000,000-gallon pump and an 800-ft. compressor. Joseph Waugh, City Clerk.

Moline, Ill.—Need of new boilers to cost \$15,000 at water works is being urged.

Virden, Ill.—City has decided to install waterworks system.

West Terre Haute, Ind.—Council is considering construction and equipment of waterworks plant.

Coin, Ia.—Citizens will vote June 27 on \$12,000 bonds for installation of water works system.

Worthington, Ia.—City is considering the construction of water tank.

Augusta, Kan.—City has decided to install filtration plant for waterworks system; cost, \$12,000.

Coffeyville, Kan.—Carl Stromquist, Superintendent Water & Light Department, has completed plans and specifications for improvement of the water system at cost of \$100,000, including filter plant and additional water mains.

Bad Axe, Mich.—Citizens have voted bonds to extend city water mains.

Detroit, Mich.—Water Board has asked for bids for 11,000 tons of iron pipe.

Barnesville, Minn.—All bids for extending water works have been rejected; city will do work by day labor.—M. P. Phillippi, City Clerk.

Montgomery, Minn.—Mathias Machacek, New Sprague, is preparing plans for construction of reservoir; J. W. Kaisersatt, City Clerk.

Red Wing, Minn.—City is considering construction of water mains.—A. E. Rhame, City Engineer.

McComb, Miss.—City is considering \$15,000 bond issue to improve and extend water works.

Festus, Mo.—Fuller, Coult Co., Chemical Bldg., St. Louis, Mo., consulting engineers, will prepare plans for construction of system of waterworks.

Crawford, Neb.—Issuance of \$24,000 bonds for establishment of gravity water system is being considered.

Milltown, N. J.—Installation of water works system is being considered. Address Mayor Richter.

Woodbury, N. J.—Citizens will soon vote on \$70,000 bonds to lay water mains.

Cornwall, N. Y.—Village has been authorized by State Water Commission to spend \$30,000 in constructing and additional storage reservoir.

Beach, N. D.—Bids will be received about July 1 for the construction of waterworks; W. Plamason, engineer.

Fremont, O.—Citizens will vote, July 11, on \$54,000 bonds for water main extensions and fire department improvements.

Toledo, O.—Service Director Cowell will prepare plans and specifications for connection of high pressure fire service pumping station.

Urbana, O.—Council has authorized Director of Public Service to engage consulting engineer in connection with proposed improvement of the waterworks system.

Berwyn, Okla.—Installation of \$3,500 water works system is being considered.

Custer, Okla.—Western Engineering Co., Oklahoma City, is preparing plans for water works and electric light plant; cost, about \$40,000.

Edmond, Okla.—Citizens have voted \$20,000 water, light and sewer bonds.

Nowata, Okla.—City has sold \$75,000 water works bonds to Spitzer, Rorick & Co., Toledo, O.

Bethlehem, Pa.—Citizens will vote in November on \$175,000 bonds to erect water plant.

Glen Rock, Pa.—Jacob H. Brillhart, 34 N. 7th Ave., Bethlehem, has been selected to prepare plans and specifications for additional water supply.

Shrewsbury, Pa.—City will construct waterworks improvements; \$12,000 bonds have been sold.

Greenville, Tenn.—Citizens have voted \$60,000 water and light bonds.

Dallas, Tex.—Plans are being considered by City Commissioners for connecting up of the cement plant wells, sinking of gang wells of shallow wells along line of the pipe to be laid, development of water gravel stratum west of the city and sinking of five or more artesian wells to wood-bine stratum along line of West Dallas gravel pit main.

Dallas, Tex.—Bids have been ordered by the Board of Municipal Commissioners for electric motors and belt-driven air compressors for the pumping of six artesian wells in center of city.

Denison, Tex.—Council has decided to immediately begin sinking of artesian well at the new pump station at Shawnee Reservoir.

Montpelier, Vt.—National Board of Fire Underwriters has recommended installation of additional water mains and hydrants.

Seattle, Wash.—Board of Public Works has adopted plans and specifications for floodgate at Lake Union plant.

Sparta, Wis.—City is considering laying 1400 ft. of 10-in., 400 ft. of 8-in., 750 ft. of 6-in., and 1200 ft. of 4-in. c.-i. water mains; C. H. Gregory, Superintendent Water Works.

North Bay, Ont., Can.—Citizens have passed \$100,000 by-laws for water works for city.—T. N. Colgan, Commissioner of Works.

West Lorne, Ont., Can.—F. W. Farmcombe, London, is preparing plans for water works.

CONTRACTS AWARDED

San Francisco, Cal.—Completing laying of pipe for the auxiliary water system in district bounded by Market, Castro, 29th, Mission, 26th, Harrison and 11th Sts., to the Raich Improv. Co., \$91,500.

Chicago, Ill.—Building foundations for pumps at 22d St. pumping station to Myron B. Reynolds, 4711 Kenmore Ave., \$9,500.

Joliet, Ill.—To Hill-Tripp Pump Co., of Anderson, Ind., for equipment of new city pumping station, \$5,985.

Stamford, Ill.—Building water works to C. C. Bowman, Bloomington, \$5,800; the work includes brick pumping station, pumping machinery, pump pit, hydro-pneumatic tank and a small system of water mains.

Seneca, Kan.—To Hybman & Wiley for improvements to waterworks system, \$15,000; Burns & McDonnell, Scarritt Bldg., Kansas City, Mo., engineers.

Marquette, Mich.—Extending water system into lake to Wanless & King, Duluth, Minn., \$60,000.

Libby, Mont.—To Crane-Ordway Co., of Great Falls, for material for waterworks system; cost, \$18,000.

Bladen, Neb.—Furnishing c. i. pipe and specials to the American Cast Iron Pipe Co., Kansas City, Mo.; construction work was let to the Inter-Mountain Bridge and Construction Co., Tecumseh, Neb.—Charles Balderston, City Clerk.

Rahway, N. J.—By Pumping Station Committee for the erection of building to house new \$14,000 pump to be installed at the water works to E. F. Wilson, \$1,294.

Schenectady, N. Y.—Laying water mains in five streets to Thos. R. Crane.

Masontown, Pa.—Water filtration plant to the Pitt Constr. Co., Pittsburg.—Chester & Fleming, Union Bank Bldg., Pittsburg, Engineers.

Pittsburg, Pa.—To the Allis-Chalmers Co., Milwaukee, Wis., for furnishing 2 pumps for the new pumping station at filtration plant at \$102,810 each.

Newport, Tenn.—To the American Light and Water Co., Chicago, Ill., constructing gravity water system; daily capacity about 300,000 gallons, \$16,940; W. P. Bullock, Kansas City, Mo., engineer.

Fort Worth, Tex.—Constructing settling beds for use with proposed reservoir to Pittsburg Filter Manufacturing Co., \$65,983.

Dallas, Tex.—Erecting two boilers at White Rock pumping station to A. G. Wright for two Casey-Hedges Co. boilers, \$2,045.

Basin, Wyo.—Water works and electric light improvements to the Katz-Craig Contracting Co., Omaha, Neb., for entire work, \$58,582.72; includes American cast iron pipe, \$11,948.72; hydrants and valves, pumping and electrical machinery, \$12,250; other general bids on construction: Des Moines Bridge & Iron Works, \$30,890; W. D. Lovell, Minneapolis, \$30,996; Lindstrom & Oren, Billings, \$31,500; Iruer & Stanton, Basin, \$32,772; Tanner Bros., Webster, S. D., \$32,900.

LIGHTING AND POWER

Helena, Ark.—Plans and specifications have been completed by Scofield Eng. Co., Arcade Bldg., Philadelphia, Pa., for power house and equipment for Helena Gas & Electric Co.; bids are now being asked.

El Centro, Cal.—Imperial Valley Gas Co. is considering extending mains to Brawley, about 15 miles.

Fillmore, Cal.—Ventura County Power Co. is planning to rebuild transmission line.

Santa Barbara, Cal.—Santa Barbara Gas & Electric Co. is considering an increase in its bonded indebtedness from \$1,000,000 to \$2,000,000 for improvements.

Gunnison, Colo.—Bids will be received about July 1 for purchase of \$90,000 bonds to be used for construction of water power plant to furnish water and power for domestic and commercial purposes.—M. J. Schmitz, Town Clerk.

Albany, Ga.—Citizens have voted \$50,000 bonds to erect municipal gas plant.

Colquitt, Ga.—Plans are being prepared by J. B. McCrary Co., 1311 Empire Bldg., Atlanta, for electric light plant.—P. E. Wilkin, Mayor.

Fort Wayne, Ind.—Board of Public Works has decided to ask for bids for furnishing lamp posts.

Hartford City, Ind.—Crescent Gas & Oil Co., of Hartford City, owned by T. N. Barnsdall, of Pittsburg, has been sold to J. L. McCullough, Marion, who will supply Hartford City with artificial gas, along with Fairmount, Gas City and other smaller cities; central point of manufacture will be Marion.

Takoma Park, Md.—Mayor W. G. Platt will confer with officials of Potomac Electric Power Co. with view to installing electric lamps; oil lamps are now used.

Marshall, Mich.—Commonwealth Power Co., of Jackson, is considering the construction of dam across Kalamazoo River, 6 miles from Marshall.

North Branch, Minn.—Village Council has granted electric light franchise to Eastern Minnesota Power Co., Pine City.

Billings, Mont.—Establishment of improvement district for decorative lighting purposes is being considered.

Fergus Falls, Mont.—Election on bonds for development of electric light plant is being considered.

Springfield, Mo.—Springfield Railway & Light Co. has issued \$30,000 of bonds for improvements and extension of system; betterments will include installation of turbine unit, doubling generating capacity of electric lighting system and additional gas producing equipment and extension of gas and electric distributing systems.

Custer, Okla.—Western Engineering Co., Oklahoma City, is preparing plans for electric light plant and water works; cost, about \$40,000.

Edmond, Okla.—Citizens have voted \$20,000 light, water and sewer bonds.

Eugene, Ore.—City has sold \$25,000 bonds for installation of electric street lighting system to Morris Bros.

Newberry, S. C.—Southern Lower Co. has applied for franchise for transmission line from Newberry to Greenwood.

Custer, S. D.—Installation of electric system is being considered.

Plankinton, S. D.—W. A. Kuntz, Woolsey, has petitioned Council for franchise for electric light plant.

Greenville, Tenn.—Citizens have voted \$60,000 light and water plant.

Austin, Tex.—Austin Gas Light Co. will erect generator house, with elevator, tower and engine; cost, about \$12,000.

Bishop, Tex.—F. Z. Bishop, owner of local electric light plant, will enlarge same.

Loraine, Tex.—City is interested in establishment of electric light plant.—W. T. Mulin is interested.

Luling, Tex.—Luling Electric Light and Power Co. will enlarge and improve plant.

Richmond, Va.—Appalachian Power Co. will soon call for bids for machinery; Blackwell & Buck, 49 Wall st., New York, engineers.

Centralia, Wash.—Washington-Oregon Corporation, which owns local street car, power and water service, is about to install power plant at Kalama River at cost of \$750,000; pipe connection covering distance of 60 miles will be laid down to reach the power to twin cities of Centralia and Chehalis. Isaac Anderson, Tacoma, President.

Clarkston, Wash.—Council passed an ordinance granting to the Clarkston Improvement Co. right to construct an electric light and power system.

North Yakima, Wash.—Citizens will vote July 1 on \$200,000 bonds for construction of municipal electric light plant.

Hamilton, Ont., Can.—Engineer E. J. Sifton has estimated cost of municipal power, lighting and distribution plant at \$502,000; plan includes 8,000 electric standards, placed 100 ft. apart over entire city, 200 commercial lighting customers and 1,000-H.P. for power customers; 3,051-H.P. will be required, and rates for house lighting will be 4 8-10 cts. per K.W.-hour, as compared with 7.52 now paid to the Cataract Power Co.—S. H. Kent, City Clerk.

CONTRACTS AWARDED

Webster City, Ia.—Furnishing equipment for municipal electric light and power plant to Murray Iron Works, Burlington, for installing engines, boilers, piping and heaters, \$12,200; to Westinghouse Electric & Manufacturing Co., Pittsburg, Pa., for electric generators and switchboards, \$9,998.

Midway, Ky.—Building municipal light plant, covering both generating station and line construction, to Moore-Young Electric Co., Lexington.

Springfield, Mass.—Furnishing additional equipment for electric light plant to General Electric Co., Schenectady, N. Y., \$3,377.50.

Iron Mountain, Mich.—Construction of a concrete dam and power plant for Peninsular Power Co., to the Newton Engineering Co., Milwaukee, Wis.

Marquette, Mich.—Construction of a dam on Dead River to Powell & Mitchell, Marquette, \$57,000; for Silver Lake dam to Wahlman & Trebilcock, Ishpeming, \$15,000.

New Hartford, N. Y.—Village Board has entered into contract with Utica Gas & Electric Co. for lighting of streets for period of five years.

Terrell, Tex.—Building concrete and steel power house to house city light and water plants to Sherwood Concrete & Paving Co., \$5,950.

Basin, Wyo.—Electric light and water works improvements to Katz-Craig Contracting Co., Omaha, \$58,582.72.

FIRE EQUIPMENT

Sacramento, Cal.—Plans for two new fire houses, one for the northeast and one for the southeast section of city have been approved by Fire and Building Committees of City Trustees. E. C. Hemmings and R. A. Herold, Architects; both houses will be equipped with auto apparatus.

Bridgeport, Conn.—Board of Fire Commissioners has recommended erection of fire house, truck house and building to house signal system.

Milton, Del.—Town will issue \$15,000 bonds to equip fire department and erect water plant.

Preston, Ida.—Volunteer fire department has been formed.—A. W. Stephen, Chief.

Decatur, Ind.—City has agreed to contract terms of which create stock company of twenty-five business men who are to build \$18,000 city hall and equip it with automobile fire department, they to receive stated dividend each year until amount is paid; committees have been appointed to purchase equipment and plans for building have been completed.

Fort Wayne, Ind.—Board of Public Safety will at once ask bids for 2,500 ft. of fire hose.

Wichita, Kan.—Fire Chief A. G. Walden has recommended purchase of 4,000 ft. of new hose and auto fire engine.

Winchester, Mass.—Site at Vine and Church Sts. has been purchased for erection of \$60,000 fire house.

Worcester, Mass.—Fire Chief Coleman is favorable to purchase two large combination trucks.

Bay City, Mich.—Auto combination chemical and hose wagon, together with a chief's auto, will be added to Fire Department apparatus.

Duluth, Minn.—Site at Seventh ave. East and Ninth st. has been purchased for erection of fire hall.

Billings, Mont.—Bids will soon be asked by Council for purchase of 1,000 ft. of fire hose.

Manchester, N. H.—City will erect fire station at Goffs Falls.

Newark, N. J.—Bigelow & Tuttle will prepare plans for erection of \$50,000 fire house for double company.

Dunkirk, N. Y.—Site on Eagle st. has been purchased for erection of proposed fire hall.

Far Rockaway, L. I., N. Y.—Plans have been filed for erection of \$50,550 fire house on Central ave. for Engine Co. 161.

Sauquoit, N. Y.—Fire company has been formed and chemical engine will be purchased.—W. D. Cress, Chief.

Ashboro, N. C.—Fire company has been organized.—S. B. Stedman, Chief.

Cuyahoga Falls, O.—Plans have been completed for fire station to be built on Broad st.; total cost will be about \$6,000.

Fremont, O.—Citizens will vote July 11 on \$54,000 bonds for fire department improvements and water main extensions.

Massillon, O.—Council has decided to purchase 1000 ft. of fire hose.

New Carlisle, O.—Council has decided to purchase 500 ft. of fire hose.

Yoe, Pa.—Citizens' Fire Company is considering erection of fire station.

East Providence, R. I.—Rumford Hose Co. has asked for 800 ft. of hose.

Montpelier, Vt.—National Board of Fire Underwriters has recommended erection of central fire station; purchase of auto chemical engine equipped with two 50-gallon tanks; two horse hose wagons, new hose and minor equipment.

CONTRACTS AWARDED

Milltown, N. J.—Furnishing \$4,100 chemical fire truck to Boyd Bros. Co., of Philadelphia.

Albany, N. Y.—Repairs to fire truck 2, American-La France Fire Engine Co., \$3,900.

Beaumont, Tex.—Furnishing fire engine, cap. 13,000 gallons of water per minute, to Ahrens-Fox Fire Engine Co., Cincinnati.

BRIDGES

Tampa, Fla.—Commissioner Snow of First District will at once get estimates for widening bridge over Spanishtown Creek.

Tampa, Fla.—Board of Public Works has decided to ask for bids for erecting bridge over Hillsborough River at Lafayette st.

Covington, Ga.—Bids will be received for constructing a concrete bridge 20 ft. high, 60 ft. wide and 100 ft. long, and for paving with macadam a street 45 ft. wide, 1,400 ft. long. Geo. T. Smith, Mayor.

Michigan City, Ind.—County Commissioners have decided to erect \$6,000 bridge across Kankakee River.

Peru, Ind.—Commissioners of Miami and Cass Counties are preparing to ask for bids for construction of a bridge over the Wabash River, between Jefferson Township and Miami Township.

Church Point, La.—Town will construct bridge and levee across Bayou Plaquemine.

Lafayette, La.—Council has authorized Street Committee to ask for bids to keep bridges and streets in repair.

Holyoke, Mass.—City Engineer T. J. MacCarthy has completed plans for Cabot St. canal bridge.

St. Paul, Minn.—Fred Nussbaumer, Superintendent of Parks, is having plans prepared for Park Commission, for a steel and concrete bridge across River Boulevard at St. Clair st.; cost, \$3,000.

Arlington, Neb.—Dodge County will build bridge across Elkhorn River.

Las Cruces, N. M.—Board of Trustees has ordered construction of 21-ft. bridge over Onqua at foot of Las Cruces Ave.

Geddes, N. Y.—Citizens have voted \$40,000 bonds to erect bridge near fair grounds and lay out highway from Solvay village to fair grounds.

Cincinnati, O.—City Engineer Shipley has submitted plans and estimates for flooring of the new Fern St. bridge; estimate is \$11,635, of flooring of reinforced concrete with covering of asphalt; plans and estimates for substructure of Ludlow Ave. viaduct, which is to eliminate the

grade crossing of the B. & O. Railroad have also been submitted to Director Sundmaker; cost, \$76,000.
 Pittsburg, Pa.—Mayor W. A. Magee has recommended erection of Sawmill Run, Bloomfield and Sylvan Ave. bridges.

CONTRACTS AWARDED

Wilmington, Del.—Building bridge over western arm of Smyrna River to Jos. Anderson, Delaware City, \$1,500.
 Salem, Ind.—By Washington County Commissioners for construction of one concrete and one steel bridge to E. J. and H. F. Burk, Richmond, Ind.
 Waverly, Ind.—Construction of a 5-span concrete bridge across White River by the Morgan County Commissioners to National Concrete Co., \$38,750.
 Mankato, Minn.—Constructing two concrete bridges, to Marsh Engineering Co., Des Moines, Ia., \$5,650.
 Newark, N. Y.—Erecting three bridges on flats north of village during next three months to Oswego Bridge Co., largest bridge, \$1,500, and two smaller ones to Z. T. Darrow & Sons, Canandaigua, \$2,500 each; reinforced concrete will be used.
 Milwaukee, Wis.—Constructing a 1-leaf bascule bridge across the Milwaukee River at Oneida st. to Milwaukee Bridge Co., Milwaukee, \$55,745 for superstructure, \$92,845 for entire work; other bidders: Modern Steel Structural Co., Waukesha, Wis., superstructure, \$71,469; Hell Co., Milwaukee, superstructure, \$53,875, entire work, \$99,875; A. Vogel, Starke Dredge and Dock Co., Milwaukee, entire work, \$104,272; Strobel Steel Construction Co., Chicago, Ill., superstructure, \$66,400; J. E. Hathaway & Co., Milwaukee superstructure, \$44,000. L. J. Klug, Superintendent Bridges.

MISCELLANEOUS

Bessemer, Ala.—City is planning to erect \$30,000 hospital.
 Decatur, Ala.—City has sold \$25,000 city hall bonds to W. N. Coler & Co.
 Huntsville, Ala.—Bids will be received at once by Mayor Smith for erection of municipal hotel.
 Moulton, Ala.—Lawrence County Commissioners are considering erection of jail.
 Glendale, Ariz.—Town is considering erection of town hall and jail.

Pasadena, Cal.—The City Commissioners are considering plans for city aviary and will at early date have architects assist them in devising attractive birdhouse at Central Park.
 Wilmington, Del.—Phoenix Fire Company has decided to purchase auto ambulance.
 Washington, D. C.—Consul George Helmrod, of Berne, Switzerland, has reported that plans for municipal slaughterhouse, to cost several hundred thousand dollars, are being prepared by Architect Max Muench, of Berne, who has been allowed a period of six months by city for the completion of his preparatory work; American firms desiring to make offers for installation, etc., should address the Berne municipal building department (Städtische Bau-Direktion, Berne), but letters, and, if possible, descriptions should be in German or French.

Albany, Ga.—Citizens have voted \$10,000 bonds to beautify and enlarge parks.
 Freeport, Ill.—Dr. J. A. Poling has recommended purchase of three or four sanitary garbage wagons.
 Poseyville, Ind.—Town will issue bonds to erect \$6,000 town hall.
 Carlisle, Ky.—Council has decided on plans for erection of city hall on Chestnut St.
 Boston, Mass.—Commissioner Rourke, of the Public Works Department, has rejected all bids received for disposal of the city's garbage and refuse for next ten years; he will at once prepare specifications for new bids.
 Winchester, Mass.—Citizens have voted \$90,000 bonds for purchase of property for park and boulevard.
 Newaygo, Mich.—Board of Corrections has ordered Board of Supervisors to erect permanent jail.
 St. Louis, Mo.—Citizens will vote Nov. 7 on \$2,250,000 bonds for completion of municipal bridge.
 Kearny, N. J.—To house town ambulance, patrol wagon and new auto fire apparatus: Town Council will erect a brick building at Berlin and Windsor Sts.
 Westfield, N. J.—Park Commissioners have decided to issue \$10,000 bonds for improvement of Mountain av. park.
 Woodbury, N. J.—Council has advertised for bids for automobile for use of Water Superintendent in going to and from pumping station.

Binghamton, N. Y.—As soon as specifications can be prepared Board of Contract and Supply will advertise for bids on remodeling, grading and improvement of Kent playground in Sixth Ward.
 Schenectady, N. Y.—Bids will be received June 28, noon, for \$100,000 bonds for erection of jail and courthouse.—J. I. Winne, County Treasurer.
 Toledo, O.—Service Director Cowell has \$12,000 available for purchase of six garbage wagons, equipment and horses.
 Muskogee, Okla.—City and county officials are considering \$500,000 bond issue for erection of joint ten-story office building.
 Klamath Falls, Ore.—Citizens will soon vote on \$30,000 bonds to erect town hall.
 Pittsburg, Pa.—Mayor W. A. Magee has recommended passage of ordinance for erection of city hall and municipal refuse plant; also park and wharves improvement.
 Salt Lake City, Utah.—Council has appropriated \$2,500 for use of Park Board in installing apparatus in playgrounds at Pioneer Park and to complete playgrounds at Liberty Park.
 Portsmouth, Va.—Council has decided to erect modern \$40,000 office for clerks.
 Upton, Wyo.—Owing to election contest, bids for proposed construction work will not be received until later date, probably about 30 days.—Burns & McDonnell, Scarett Bldg., Kansas City, Mo., Engineers.

CONTRACTS AWARDED

Boston, Mass.—To F. S. Marvel, Newburg, N. Y., for building steel hull ferryboat for Boston service, \$118,000.
 Manchester, N. H.—Furnishing garbage truck to W. C. Shear, local agent for Peerless garbage truck, \$4,000.
 Brooklyn, N. Y.—To Joseph N. Early, New York City, for furnishing 1,059 street signs of five different varieties in different parts of borough, \$1,495.80.
 Schenectady, N. Y.—To Jas. H. Johnson, city, for erecting county tuberculosis hospital, \$35,471.
 Doylestown, Pa.—By Bucks County Commissioners to W. A. Collins, of Falls township, to build dykes at the mouth of Scott's Creek, \$4,895.
 Salt Lake City, Utah.—Building city stables to P. J. Moran, \$42,647.

TOO LATE FOR CLASSIFICATION

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Wisconsin	Corliss	June 23, 8 p.m.	Constr. six blocks of cement sidewalks, and eleven st. crossings.	H. B. Schmid, Village Clerk.
Iowa	Waterloo	June 26, 7:30 p.m.	Constr. 5,850 sq. yds. sheet asphalt paving; 4,043 lin. ft. combined curb and gutter.	R. C. Thompson, City Clerk.
Wisconsin	Green Bay	June 27, 2 p.m.	Improving various streets by grading, constr. sidewalks of Portland cement; concrete combined curb and gutter; paving with asphalt, vit. brick, tar macadam or creosoted wood block.	W. W. Rand, City Engineer. Clarence Bird, Village Clerk.
New York	Saratoga Spgs.	June 28, 3 p.m.	Constructing concrete walk.	W. W. Rand, City Engineer. Clarence Bird, Village Clerk.
Ohio	Hamilton	June 29, noon	Improving portion of Fairgrove Ave. by paving roadway with bituminous macadam.	C. M. Robertson, Clk. Dept. P. Serv. John W. Gauthier, Dir. Pub. Serv.
Ohio	Akron	June 29, noon	Paving portions of various streets.	Bd. Freeh., Hudson County.
New Jersey	Jersey City	July 5	Paving the Plank road.	Bd. Freeh., Hudson County.
SEWERAGE				
Iowa	Waterloo	June 26, 7:30 p.m.	Constr. 5,170 ft. 10-in. sewers; 1,890 ft. 12-in.; 1,220 ft. 15-in.; 400 ft. 30-in.	R. C. Thompson, City Clerk. H. Seymour Getman, Chm. B. S. C.
New York	Frankfort	June 29	Constructing a complete sewer system.	H. Seymour Getman, Chm. B. S. C.
Pennsylvania	Ligonier	July 1	Building sewage disposal plant, including sedimentation tank, sprinkling filter, sludge bed and pumping station; F. H. Shaw, Lancaster, Engineer.	I. F. Brandt, Boro. Clerk.
New Jersey	Elizabeth	July 3, 8:30 p.m.	Constr. 665 ft. 24-in. pipe sewer; 510 ft. 20-in.; 510 ft. 18-in.; 560 ft. 15-in. house connections, and appurtenances.	N. K. Thompson, Street Comr. Iowa Engr. Co., Clinton, Ia., Engrs.
Iowa	Valley Junction	July 13, 7 p.m.	Constr. 5½ miles 8 to 20-in. sewers and a sewage disposal plant.	John T. Moore, Mayor.
Georgia	Macon	July 10, noon	Digging trenches and laying 5,003 ft. 12-in. pipe; 3,140 ft. 8-in.; 5,363 ft. 6-in., hydrants, valves, special castings etc.	John T. Moore, Mayor.
WATER SUPPLY				
Pennsylvania	Franklin	June 28, 3 p.m.	Furn. one horizontal duplex direct acting triple expansion steam pumping engine, daily capacity 3,000,000 gals., with foundations, erected complete. One tubular 72-in. by 18-ft. horizontal 150 pounds working steam pressure boiler, with dome, complete and wrought iron stack 100 ft. high.	Geo. S. Criswell, Chm. B. W. Comrs. Wm. T. Patton, Town Clerk.
Indiana	Rockville	July 3, 2 p.m.	Digging a well 8-ft. in diameter and 32 ft. deep, walled with con.	Geo. S. Criswell, Chm. B. W. Comrs. Wm. T. Patton, Town Clerk.
LIGHTING AND POWER				
New York	Buffalo	July 1, 11 a.m.	Furn. and erecting power plant equipment at tuberculosis hospital at Pertsysburg, N. Y.; power house and laundry; wiring to main building; constr. water supply system laundry machinery, ice machinery.	Francis G. Ward, Comr. Pub. Wks.
BRIDGES				
Iowa	Waterloo	June 26, 7:30 p.m.	Constr. concrete steel arch bridge over cut-off on Whitney road.	R. C. Thompson, City Clerk.
FIRE EQUIPMENT

RESERVOIRS

For Irrigation, Water Power and Domestic Water Supply

2d Edition—Revised and Enlarged.
By J. D. Schuyler

With an account of Various Types of Dams and the Methods, Plans and Cost of their Construction

ALSO CONTAINING MISCELLANEOUS DATA UPON

The Available Water Supply for Irrigation in Various Sections of Arid America; Distribution, Application, and Use of Water; Rain-Fall and Run-Off from Various Water-Sheds; Evaporation from Reservoirs; Effect of Silt upon the Useful Life of Reservoirs; Average Cost of Reservoirs per Unit of Capacity, Etc.

Over Sixty percent of all the illustrations in this edition are new, and a greater proportion of the reading matter is also rewritten.

573 PAGES 381 FIGURES 6 PLATES

STREET IMPROVEMENTS

Washington, D. C.—Arrangements have been made by office of public roads of the Department of Agriculture to put in two miles of demonstration road, running from Chevy Chase Circle to and beyond Bradley lane, half of the road will be built with an appropriation of \$10,000 that will be available from national government July 1, and similar amount will be contributed by Maryland.

Washington, D. C.—District Commissioners have passed orders for repaving A St. N. E. at estimated cost of \$2,500.

Crawfordsville, Ind.—City will lay 6534 sq. yd. of paving and 3 m. of 5-ft. concrete walks and gutter.—N. C. McClure, City Civil Engineer.

Clinton, Ia.—Council has ordered repaving of Fifth ave.

Des Moines, Ia.—Council has decided to pave with sheet asphalt, Thirty-third, Westworth and Twentieth Sts.

Kearny, N. J.—Council is planning street improvements, including repaving of Kearny ave. from Harrison ave. to Bergen County line at cost of \$150,000.

Pittsburg, Pa.—Council is considering ordinances for grading, curbing and paving four streets.

CONTRACTS AWARDED

Denver, Col.—To Colorado Company, for the work in West Twenty-third Avenue Paving District No. 2, \$21,771; other bidders: Denver & Pueblo Construction Co., \$22,293, and Commonwealth Construction Co., \$22,805; work calls for the paving with asphalt macadam a total of 14,912 sq. yds.

Grand Rapids, Mich.—To C. E. Williams, for improvement of Clancy st. with West-rumite.

Hibbing, Minn.—Curbing and guttering several blocks of streets to Johnson-Mey-nahan Construction Co., 39½c. per lin. ft.

Virginia, Minn.—Laying 23 blocks of bitulithic paving on concrete base on Cleveland, Mesaba and Central Aves. and Cook and Spruce Sts. by the Council to the H. L. Bartlett Co., Virginia, \$83,856.60, or \$2.40 per sq. yd. for laying paving and 60c. per cu. yd. for excavating; P. McDonnell, Duluth, was awarded the contract for laying 13 blocks of cressote block paving on concrete base, 3¼-in. block, weighing 16 pounds, \$2.61 per sq. yd. for paving and 68c. per cu. yd. for excavating; total, \$37,005.58. The other bidders were Warren Bros., Duluth; C. C. Butler Contracting Co., Virginia; the Pastoret-Lawrence Co., Duluth; J. P. O'Connor, Duluth.

Hastings, Neb.—Paving with asphalt St. Joe and Denver aves., to M. Ford, Omaha, \$2.11 per sq. yd.; combined curb and gutter, 54c. per lin. ft.; resetting old curb, 10c. per lin. ft.; paving brick portion of same thoroughfares, to E. R. Bing, city, \$1.88 per sq. yd. for Hastings brick block paving.

Roselle, N. J.—Curbing and guttering Chestnut st. and Fourth ave., to the A. L. Clark Stone Company, Elizabeth, 81c. per lin. ft., there being 6,243 lin. ft.

Rochester, N. Y.—By Board of Contract and Supply to Whitmore, Rauber & Vincinus for Park Ave. and Gardner Ave. asphalt pavements, \$26,120 and \$15,613; Copeland St., brick pavement, to Clarence Aikenhead Co., \$6,033; Pinnacle Road, brick pavement, to F. V. Brotsch, \$7,858; Magee Ave., cement walks, to W. A. Margrander, \$893; Mohawk St., grading and walks, to Julius Friedrich Co., \$619.50.

Toledo, O.—By Board of Control to establish the grade of Post St. at the Lake Shore & Michigan Central tracks to Chas. P. Peters & Son, \$23,947.

York, Pa.—To York Stone & Supply Co. to furnish broken stone for asphalt paving on West Philadelphia St., \$1.15 per perch.

Sumter, S. C.—To Geo. W. Waring, Columbia, to put down paving on Main st. roadway.

Lynchburg, Va.—To S. B. Bennington, for building tar macadam driveway in Miller Park, about \$5,000.

SEWERAGE

Washington, D. C.—Report from American consular officer states that municipality in his district is contemplating establishment of new sewerage system within 6 or 8 months; preliminary work is now being carried on by an engineer, and report suggests that American manufacturers of sewerage equipment should get in communication with this person as soon as possible, with view to having their equipment adopted in system. Address No. 6331, Bureau of Manufactures.

Fort Dodge, Ia.—Council is considering construction of sanitary sewer on Seventh ave. North.

Beverly, N. J.—Council has authorized building of 3,300 ft. of 8-in. sewer pipe on Broad st.

Pittsburg, Pa. Council is considering ordinances for sewerage nine streets.

Aberdeen, S. D.—W. P. Manson, Troy, N. Y., and City Engineer R. B. Easton will inspect system of sewage disposal now in operation at Santa Monica, Cal., and later report to Council if system is practical for this city.

Richmond, Va.—Council has ordered construction of sewers on following streets: Beverly, \$2,113; Lodge st., \$1,256, and Clay, \$2,388.

Rocky Mount, Va.—Citizens have voted \$75,000 bonds for establishment of sewerage, water works and municipal electric light plant.

Seattle, Wash.—Board of Public Works has rejected all bids for constructing sewers on Eleventh ave. West, and will ask new bids.

CONTRACTS AWARDED

Clinton, Ia.—To Greene & Son, Appleton, to complete sewer system, Dist. 4, \$124,375.

Grand Rapids, Mich.—To Carpenter & Anderson, for building east side sewer, \$356,722.63.

Richmond, Va.—Constructing sewer on Thirty-first st., to H. W. Maynard & Co., \$6,727.

LIGHTING AND POWER

Elkhart, Ind.—Indiana & Muncie Electric Company has announced plan to rebuild dam over St. Joseph River and erect a power house developing 2,500 horse power.

North Branch, Minn.—Council has granted franchise to Eastern Minnesota Power Co., Pine City, to operate electric light.

St. Paul, Minn.—Chief Engineer Claussen has completed specifications for city lighting covering gas and electric lighting and gasoline lamp post system; bids will be asked on at least twelve propositions in connection therewith.

Clydepark, Mont.—W. B. Calhoun is interested in proposed installation of electric light plant.

Hardwick, Va.—Village has appropriated \$65,000 to increase electric light plant; \$15,000 will be spent for equipment.

Rocky Mount, Va.—Citizens have voted \$75,000 bonds for establishment of municipal electric light plant, water works and sewerage.

Spokane, Wash.—Henry L. Doherty & Co., controlling Spokane Falls Gas Light Company, will expend \$500,000 on erection of gas plant.

FIRE EQUIPMENT

Washington, D. C.—American consul in Canada reports that at recent meeting of town council in his district an order was passed instructing Town Clerk to write manufacturers of motor fire trucks for prices and other information; combination hose and ladder truck is desired, which could also be used, by removing the top, for coal-hauling purposes. Address No. 6879, Bureau of Manufactures.

Ventnor, N. J.—Ventnor Fire Company is urging purchase of chemical engine and bettering of fire alarm system.—Address Chief Kuhl.

Tacoma, Wash.—Council is considering erection of \$28,000 fire hall at E. 26th and C sts.

CONTRACT AWARDED

Lansford, Pa.—Installing fire alarm system, to the Gamewell Fire Alarm Telegraph Co., \$1,700.

BRIDGES

CONTRACTS AWARDED

Sherburne, N. Y.—By highway authorities of the towns of Hamilton and Sherburne, for building abutments for new cement bridge over Chenango River in Earlville, to C. C. Chandler, Earlville.

Richmond, Va.—To George Donald, for building reinforced concrete arch bridge over Gillies Creek; \$9,011.93.

MISCELLANEOUS

New Haven, Conn.—City has been granted authority to issue \$75,000 bonds to erect contagious disease hospital.

BIDS RECEIVED

Boston, Mass.—By Park Commissioners for construction of the bear-den section of Franklin Park Zoological Garden; J. A. Rooney, lowest bidder, \$11,445; the other bidders were: Carroll Construction Co., \$11,750; M. F. Culbert, \$12,850; West Roxbury Trap Rock Co., \$21,795, and the Timilty-Shawmut Construction Co., \$22,221; iron work of den, Smith Construction Co., \$7,700; W. A. Snow Iron Co., \$7,740, and F. A. Houdlette & Sons, \$17,435.

PROPOSALS

FIRE HOSE

Oil City, Pa.

The undersigned will receive bids up to 7:30 P. M., Monday, June 26, 1911, for furnishing the following fire hose:

2500 feet 2-12" fire hose.

500 feet ¾" fire hose

C. W. MULLALLEY,
Controller.

CAPITAL WANTED

WANTED Partner with \$200,000

To place on the market the HARRIS SMOKILESS AND ODORLESS GARBAGE INCINERATOR, Patent just allowed.

In large units generates 1,200 horsepower from its steam boilers, capable of heating public buildings and lighting towns and cities of 100,000 inhabitants.

Ground floor propositions now open to men with money and brains. Plans open to inspection at this office. Address

J. B. HARRIS, M.D.
210 Stahlman Bldg.,
Nashville, Tenn.

BOOK NOTICE

Clarification of Sewage.—By Rudolf Schmeitzner. Translated by A. Elliott Kimberly. Cloth, 7½ x 5 in., illus., 15 + 114 pp. New York, The Engineering News Publishing Company; London, Constable & Company, Ltd., 1910, \$1.50.

This book is the result of a visit by the author to a number of the larger German clarification plants where preparatory devices constitute the entire treatment of sewage. The plants are discussed from an engineering standpoint, the chemical and bacterial phases of the question being but briefly mentioned, and the book is a critical review of the design of screens of various types of sedimentation tanks, of towers, and of methods of sludge removal and disposal at present in use in Germany. The Contents are: Introduction; General Principles of the Design of Clarification Plants; The Composition of Sewage; Component Parts of a Clarification Plant; Sludge Removal and Treatment for the Recovery of By-Products; Practical Arrangement of Clarification and Purification Plants; Addendum; List of Plates; Index.

No. 26

VIEW OF PART OF PHILADELPHIA MODEL, SHOWING TREES, RIVER AND BUILDINGS

CONSTRUCTION OF MODELS

Buildings Cut from Wood Blocks, or of Card Board—Sponges, Wool Shavings and Felt to Represent Trees, Shrubs and Lawns—Cigar Ashes, Glass, Beads and Wire Used
Reproducing Surface Topography

THE practice of informing the taxpayers as fully as possible concerning contemplated plans in connection with all public enterprises is becoming more common, and commendably so. Partly as the cause and partly as the result of this, the average citizen is becoming more proficient in understanding both reports and drawings. It still remains true, however, that not only the average citizen but even the engineer or architect himself can more fully appreciate the appearance of proposed buildings, layouts of parks, etc., from a model made accurately to scale than from the best of plans. The best example of

such models which we have seen was the exhibit in connection with the Conference on City Planning, in Philadelphia, described in our issue of May 24. It seems to us that city officials in charge of or interested in the adoption of plans for public improvements might well make freer use of models than heretofore has been the practice. For this reason we offer a few suggestions as to how these may be prepared.

The most elaborate and realistic model at the exhibit referred to, and what is said to be the most complete ever constructed, was one of the proposed parkway in Philadelphia, a photo-

graph of which was presented in connection with our article above referred to. The parkway plan from which the model was made was designed by William E. Groben, architect of the Department of Public Works of that city. The model was constructed from these plans and under the architect's personal supervision, 20 skillful modelers, colorists, and expert Swiss wood carvers especially selected for this work being employed upon it.

The base or platform of the model is about $3\frac{1}{2}$ inches in thickness and was made in three layers, each with the grain of the wood running in a direction different from the others to avoid cracks and warping. The central layer is cored, i. e., the wood was laid in very thin strips and firmly glued together. Because of its great length and to permit of its being transported, the base, which is 30 feet long, was made in three sections, dowelled together. The natural grade or slope of the ground was obtained by planing down and carving the upper layer. The streets between the curbs were also cut out $1/16$ -inch deep to give the effect of roadways.

The buildings are solid wooden blocks cut accurately to the general shape of the buildings. On these blocks were pasted drawings representing the several faces of the building, showing windows, the joints of the masonry, etc.

To overcome the flat appearance in the ordinary cardboard model, moldings were applied to the buildings after the drawings had been pasted on the blocks, and were painted to represent cornices and band courses. These moldings throw the proper shadows and give a wonderfully realistic appearance to the model. The ornamentation of the buildings was made by pen or color on the drawings. Free-standing columns were made of wood carved or turned on a lathe. The capitals and bases were modeled out of composition. Pylons, monuments, statues and fountains were delicately carved from hazel wood by the Swiss workmen.

A very realistic touch was given to the model by the reproduction of the trees and other foliage along the streets and in the parks. Trees were made from small pieces of sponge cut to shape, dipped in green dye and fixed on nails. Bushes and branched trees were made by sticking the sponges on pieces of flexible wire instead of nails. Occasionally scraps of tree fern from the florist were used to make dense park foliage. Grass was simulated by "flock" or wool shavings thrown on wet green paint. Flowers were sponges tinted various colors by dipping in dyes. Hedges were tiny strips of green felt glued in place.

Rocks and stones were made of bits of jagged wood tinted to proper color with gray paint and crusted with cigar ashes. Hills were formed by applying the wooden blocks to the base and carving them out to the required slope and height. The Schuylkill river was gelatine tinted with water color and applied in a very thin coat to avoid cracking. The effect was so realistic as to actually cast the reflections of the buildings along its banks. Glass was inserted in basins and fountains to represent water, and blown glass for jets of water. Roadways were painted to represent asphalt or macadam. By this scheme the true natural colors were represented, which is impossible on plaster or cardboard models. The marble mosaic pavements in the court yards and entrances of buildings were made by painting them first on paper and then pasting on a wooden base. A street light was made of a glass bead on the top of a wire; of a single lamp, bent at the top, to represent a shepherd's crook standard. Where there were two or more lights a corresponding number of pieces of finer wire were twisted together for the column, the individual wires branching out at the top for arms.

Along the river were imposing parapets, balustrades and retaining walls, carved out of wood and painted to represent stone and marble. The city hall and other existing buildings were constructed with the aid of the original plans, or by measurements and photographs taken on the spot.

This model attracted so much attention from those who visited the exhibit that numerous requests have been made that

it be sent to other cities in the United States, and it is expected that this will be done during the coming year. As stated above, the base is made in three sections easily disconnected. The buildings are held in place by screws from the underside of the base, these being inserted in fairly deep auger holes in order to reduce the length of screw required. The buildings can therefore be readily removed and packed in sawdust for shipment, or if the model is to be stored at any time.

Other models at the exhibit illustrated somewhat different methods of construction. For instance, buildings made to large scale were constructed of heavy Bristol board, all features of minor relief being represented by shaded lines and shadows; the balconies, gables and the like being actually reproduced in thinner Bristol board. In place of wool shavings, grass was represented in some of these by green felt. Where glass is used to represent lakes or other bodies of water, blue paper placed beneath it greatly heightens the illusion.

For representing topography of ground surfaces where this is irregular and where cross section lines have been run or contour maps plotted, there are two convenient methods of using the data. Where the elevations have been taken, and the ground can be most conveniently represented, by a series of lines at right angles to the general trend of the contours, cross sections at frequent intervals can be drawn on stiff cardboard, accurately cut out with a sharp knife, and these cardboard strips mounted erect upon a stiff base at the proper intervals. The spaces between the strips can then be filled in with plaster of Paris, cement, papier mache, pottery clay, putty or other materials which are easily worked and convenient to obtain, and shaped, using the top edges of the cardboard strips as a guide.

The other method is especially applicable to situations where the contours are more or less circular or oval, rather than following the one general direction, as where the ground is covered with hills, knolls, etc. In this case each contour line is copied on to a piece of cardboard by means of transfer paper, and the included area cut out carefully with a sharp knife. At the same time that the outline contour is drawn the next higher contour is also transferred to the cardboard in order to indicate the exact position for placing the cardboard which represents this contour. These pieces of cardboard, when cut out, are pasted one above the other, the proper position of each on the next lower being indicated as just stated. The contour intervals and thickness of the cardboard should be adjusted to give the proper scale. It is difficult to cut with the knife cardboard more than $1/20$ of an inch thick, and $1/30$ to $1/40$ is perhaps the most convenient thickness to work with. Thick mucilage or thin glue we have found to be preferable to paste. This leaves the model of the ground surface in a series of steps. The angles between these can be filled by the use of putty, "plastacene," potters' clay or a similar substance. Plaster of Paris has the fault of setting too quickly unless made very thin, in which case it is apt to soften the glue between the cards and generally disintegrate the model by moisture. Neat Portland cement also might be used for the same purpose.

For coloring, ordinary paint can be used on the putty, or putty or plastacene already colored to the desired shade can be used. Plaster of Paris can be treated with a sizing and painted similar to a plaster wall. Portland cement will not hold ordinary paint, but paints are sold designed especially for adhering to cement.

Next to models, probably a good bird's-eye-view sketch is most satisfactory in informing the average citizen concerning proposed improvements or existing ones. One instance of this was shown by the illustration of the Poughkeepsie water works plant, reproduced in our issue of March 24, 1909; another by the plan for a park and playground at Somerville, Mass., on another page of this issue. Such bird's-eye views require considerable artistic ability, while the models, although generally taking more time, can be prepared by anyone with a little care and patience, and it seems to us are more satisfactory.

EXHIBIT BY SEWERAGE COMMISSION

FOLLOWING the Budget Exhibit of a few months ago, a public commission of New York City—the Metropolitan Sewerage Commission—has recently been endeavoring to inform the people concerning the aims of and results obtained by the commission, through the medium of an exhibit of charts, models, photographs, etc., placed in the Metropolitan Museum of Natural History. The largest part of this exhibit comprised photographs showing various pollutions of New York harbor, the boats and appliances used by the commission in its investigations, and finally photographs and plans of sewerage systems in a number of cities. Interspersed among these were a number of placards bearing phrases which were intended to catch the eye and interest almost any citizen. One of these contained a photograph of the Flatiron building, twenty stories high, accompanied by the statement, "The sewage produced in the Metropolitan district would fill this building every 43 minutes." Among the other placards were the following:

There are over 500 sewer outlets discharging into New York harbor.

Either the sewage or the public should be kept out of the water.

The water is black and effervescing with sewage in

- Gowanus Canal,
- Newtown Creek,
- Bronx River,
- Harlem River,
- Passaic River

and along many of the docks and piers of the New York water front.

Why not pump the sewage to sea?—The cost would be excessive.

Why not utilize the sewage on farm land?—There is not enough land within reasonable distance of New York.

Why not extract the manurial ingredients?—Experience shows that it costs more to extract them than they are worth.

The sewage treatment plants which were illustrated included those at Paris, Berlin, Dublin, Hamburg, Essen, Frankfurt, Amsterdam, Birmingham, Salford, Glasgow, Leeds, London and Manchester in England, and Worcester, Mass.; Columbus, Ohio; Providence, R. I.; Baltimore, Md., and Saratoga Springs, N. Y.

Probably the most striking part of the exhibit was one which was not strictly a part of the exhibit of this commission, but comprised models prepared by the model-making department of the museum and which will remain as permanent exhibits. Among these were models of the Plainfield, N. J., contact beds, together with two boxes containing samples of the stone used in them.

A grit chamber, a fine revolving screen and a coarse bar screen.

A deep sedimentation tank (like that at Toronto), rectangular sedimentation tank with scum boards, etc., and an Emscher tank.

Bleaching powder disinfecting plant.

Columbus sprinkling filters and samples of Taylor and Columbus sprinkler heads.

Gathering drift wood at the Battery and oysters in Jamaica Bay (both presumably polluted by sewage).

Bathing at Corlear's Hook, showing sewage flowing into the river from a sewer immediately above the bath house, and from there, but little diluted, into the bath house itself.

In making these models advantage was taken of the experience of the expert model makers in the use of plaster, composition similar to papier-mâché, wood, etc. Quite effective in the last-named model was the use of glass having an uneven surface to represent rippling water, this being painted on the underside a greenish-blue to represent the comparatively clear river water and a yellowish-brown to represent the sewage.

The Department of Sewers of the city also contributed to the

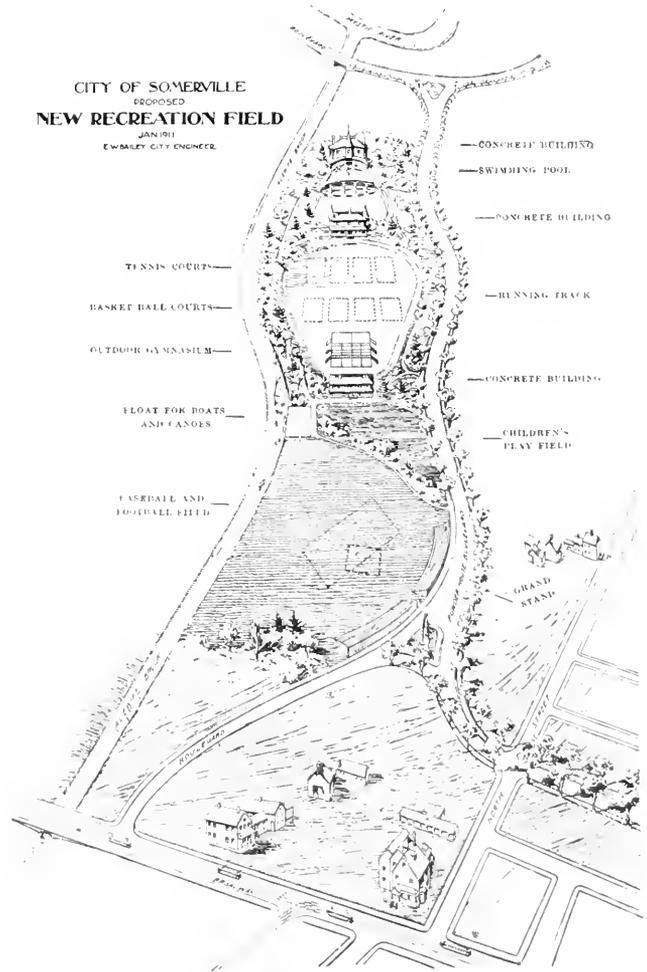

exhibition a number of photographs and drawings showing sewers and sewer outlets, catch basins and other appurtenances.

Altogether the exhibit gave the average citizen who visited it an excellent idea of the conditions in New York harbor as to pollution of water by sewage, the method of investigation carried on by the commission and the opinions and decisions reached by the commissioners. The citizen who seldom visits the water front was thus given an idea of conditions there, although the idea was by no means complete, as photographs failed to show the greasy scum, the opaque turbidity and the odors which are found not only at most of the sewer outlets but in some cases for a long distance below them. Probably the residents of New York most familiar with these conditions are the boys who are found bathing by the hundreds in this foul water, but these have no vote and little influence upon the public administration in any way.

SOMERVILLE PLAYGROUNDS

THE designing, construction and maintenance of parks and playgrounds of Somerville, Mass., form a part of the duties of the engineering department of that city of about 80,000 population. In his report for the year 1910, City Engineer Ernest W. Bailey states that there are at present twenty separate parcels of land used for parks and playgrounds, with a total area of 67.9 acres, in addition to a boulevard about 1 1/3 miles long. The original cost of the land included in these was \$368,591.13. The first cost of construction was \$246,298.73, to which there has been added at intervals additional construction amounting to \$54,139.94. The city maintains under its supervision seven baseball fields, three football fields and minor smaller playgrounds containing outdoor gymnasiums, running

CITY OF SOMERVILLE
PROPOSED
NEW RECREATION FIELD
JAN 1911
EWING L. CITY ENGINEER

SKETCH OF RECREATION FIELD

tracks, tennis courts, etc. in this respect the city believes it is in advance of most cities, but that this is necessary because of the density of population, which averages 18,500 to the square mile for its entire area. In several of the parks are field houses, which are heated, lighted and equipped with rest and toilet rooms. The ball fields are constantly in use by athletic teams, and about 300 games were arranged for and regularly scheduled last year. The entire expenditure for the year was \$13,828 for parks, cemeteries, boulevard and parkway roads, of which \$4,008.13 was for playgrounds and recreation. This expense was met by a city appropriation of \$11,800, \$267 from the High School Athletic Association, \$100 from the elevated railway company for partial maintenance of parkway, \$1,050 from the public grounds appropriation, \$150 from the Playgrounds' Association, and miscellaneous items for material and labor furnished by other departments made up the balance.

"Considering the popularity and general feeling of the public in regard to athletics and outdoor exercise in general, as shown in our own city in the last ten years' time, the question arises of the city's having at least one large permanently located field for such a purpose. A plan has been made recently, showing the layout of a new proposed field located in the northwestern section of the city, including an area of about 16 acres. This proposed field, when completed, would be the finest recreation ground owned by any city, and would include areas for baseball, football, basketball, tennis, croquet, play field for children, outdoor gymnasium, running track, swimming pool and boating and skating on the brook, a concrete grandstand and field houses equipped with shower baths, lavatories, dressing rooms, lockers, etc., and could be constructed in a term of years as the city finances would allow." Already about five acres of this area have been acquired and graded.

FERTILIZER FROM CITY REFUSE

A REPORT of a U. S. Consul, quoted in our issue of April 12, referred to a machine for crushing city refuse and preparing the same for use as fertilizer, and it was described in the May 10 issue. Since this was published we have obtained further information concerning this process. Arthur Harrison, borough engineer and surveyor of Southwark, London, stated, under date of May 27, 1911, that there is at present in use in that borough three machines of this kind, each running 54 hours per week and dealing with a daily quantity which is ordinarily between 60 and 70 tons. The refuse treated is the ordinary house-bin refuse and trade refuse. The loads are brought into the depot and dumped in front of the machines, to which they are fed by hand. During the process of feeding, the men throw out tin cans, iron, large rags, mats, oil-cloth, baskets, etc. The rags and other inflammable material are burned in a furnace and the metals are sold. The prices obtained at present for the metals are as follows: Tin cans, \$5.22 a ton; all kinds of light iron and wire, \$5.46; galvanized iron, \$3.15; enameled iron, \$2.45 per ton. These sums are received for material delivered at the works. Two of these machines were installed in 1906 and the third in 1908. The machines cost \$2,425 each; and the shafting and conveyors and electric motors, steel work and buildings brought the total cost for the three up to \$20,230.

The material fed into these machines is pulverized and the product is sold to farmers, who find it useful on stiff or clay soils. Naturally they make the most use of it in the spring and very little during the growing season, during which time it is stored at various places in the country, whence the farmers remove it during the winter months. Up to March 31 of this year the farmers had purchased 39,502 tons of this material, for which they paid about \$19,720.

This plant was described by Mr. Harrison in a paper before the Municipal Health Exhibition in 1908, in which it was offered as a method for reducing rough refuse "in one operation to a material resembling mould, suitable for immediate use on the land as manure, or for mixing with clay or heavy soil." The plant started work toward the end of October, 1906. At first there was considerable breaking of the beaters

and grids, caused by the quantity of steel and iron found in the refuse. These parts were replaced by heavier ones, which greatly reduced this breakage. The plant was driven by two 40-h.p. electric motors, belt connected, running at 650 revolutions per minute and producing about 1200 revolutions per minute in the machines.

The cost of operation, including power, labor, etc., but excluding overhead charges, is about 50 cents per ton. Of the 57 cents per ton received for the crushed material, handling and transportation leaves only about 14 cents to be applied toward the cost of crushing, leaving the net cost of this about 36 cents per ton. Of the operating cost, electric power (at 2 cents per k.w.h.) costs about 16 cents per ton; labor, 26 cents a ton; beaters, grids and repairs, 6 cents per ton; oil and sundries, 2 cents per ton; a total of 50 cents a ton.

Mr. Harrison stated as the advantages of this method that it occupies very little space and crushes the refuse without any nuisance from dust or smell, and practically deals with the whole of the refuse, leaving a very small quantity to be dealt with by sale and burning. A considerable quantity of the food condemned by the sanitary staff is disposed of quite easily by passing it through the crushers with the other refuse.

The machine described is being introduced into this country under the name of the Gardner crusher and one has been operated at the Southampton street dump, Boston, for several weeks by Daniel P. Sullivan, a bidder for the contract to dispose of the city's garbage. Newspaper reports state that on June 22 Commissioner of Public Works Rourke witnessed a test of the machine in which the waste was reduced to about 50 per cent of its former bulk, the product closely resembled coal ashes. This machine is operated by electricity. A capacity of 25 tons a day is claimed for it, or even more if fed automatically.

ALASKA ROAD COMMISSION

SINCE collecting and publishing the data concerning State road construction and supervision a few weeks ago, we have received, too late for tabulation in that issue, information from the engineer officer of the Alaska Road Commission, Glen E. Edgerton, concerning the work done by that commission. The commission is under the U. S. War Department and consists of a Lieutenant Colonel, First Lieutenant and Second Lieutenant. For administrative purposes the territory is divided into districts (at present five in number), each under immediate charge of a resident district superintendent.

The funds at the disposal of the commission consist of special appropriations from Congress for main military roads and 70 per cent of the "Alaska Fund" which is drawn from the collection of trade licenses outside of the incorporated towns in the territory.

The U. S. commissioner in each local precinct appoints a road overseer, who collects a poll tax of \$8 or two days' labor, and expends such funds and labor locally where collected. This road overseer is entirely independent of the commission and his expenditures are usually made on local routes conforming to the general plan of the commission. Owing to the fact that the law is not enforced in many of the precincts and that residents of incorporated towns are exempt, these expenditures are very inconsiderable.

During the year 1910 the territory built 39.05 miles of wagon roads, 86.25 miles of winter sled roads and 373 miles of trails; spending a total amount of \$375,000. The amount available this year will probably not exceed \$275,000.

The wagon roads are simply earth roads surfaced in the natural soil with road machines and drags, being graveled or corduroyed only where excessive moisture makes this necessary. Sled roads are unsurfaced, being intended only for winter travel. Trails are locations usually made with a view to ultimate development into roads, and are cleared, graded and bridged to be passable by pack trains in summer and dog sleds in winter. Laborers' wages vary from \$2.00 to \$10.00 per day and other expenses and materials vary accordingly. Consequently, unit costs would mean nothing unless accompanied by full details as to prices.

STREET DEPARTMENT DEVICES

THE Superintendent of Streets and Sewers of Waterbury, Conn., Benjamin Chatfield, in his report for 1910 describes a device which is used in emptying into the street department's carts the cans which have been filled by the patrol sweepers with street sweepings. Thirty-five uniformed men are employed, each having a section of paved streets assigned to him. All the sweepings are placed by him in cans as they are collected, and these cans are emptied four times a day. In emptying the cans the device shown in the illustration is used and has been found to greatly reduce the wear on the cans and the amount of time and labor required to empty them. As may be seen from the illustrations, this consists of a simple derrick with fixed boom and a drum operated by a hand wheel and provided with a friction brake. One man can readily operate the drum, while the other guides and dumps the can and returns it to its place on the sidewalk.

Three double teams are constantly employed collecting the dirt from these cans, and during the year 1910 removed 5,703½ cubic yards of street sweepings from the paved streets. Rubbish cans to the number of forty were placed about the city in conspicuous places for receiving waste paper, etc.

Another contrivance is the stone wagon for handling curbing, flagstones, etc. This is an ordinary low-hung stone wagon provided with a frame of I-beams, two resting on the rear axle and a third on the front axle, a deep horizontal I-beam at the top serving to carry on a trolley a friction hoist. The general form of construction is shown sufficiently in the accompanying cut. This should be quite effective in preventing the damage done to curbstones and flagging in unloading them from the wagons, and the perhaps even more frequent damage to the pavements.

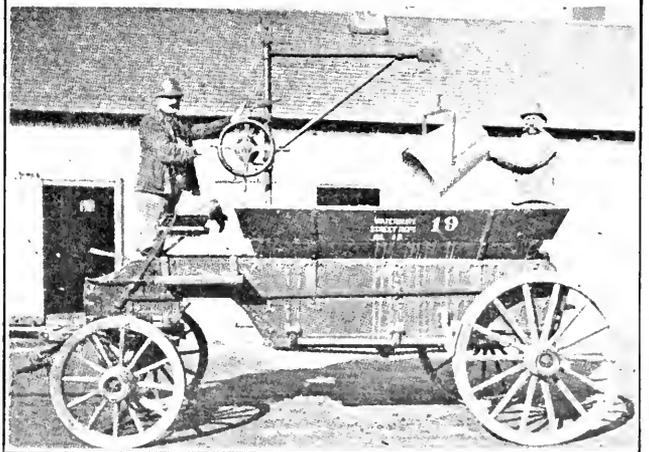

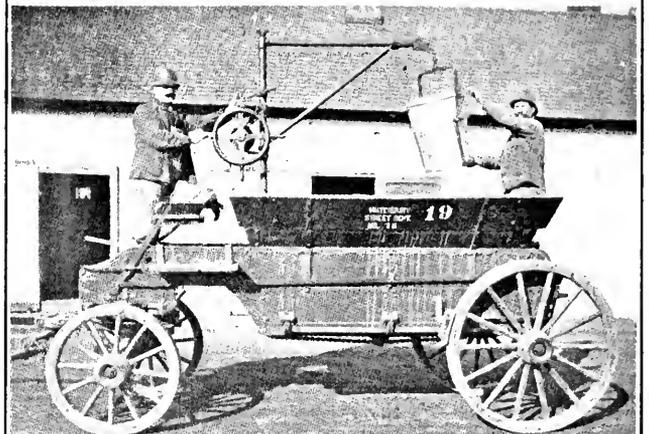

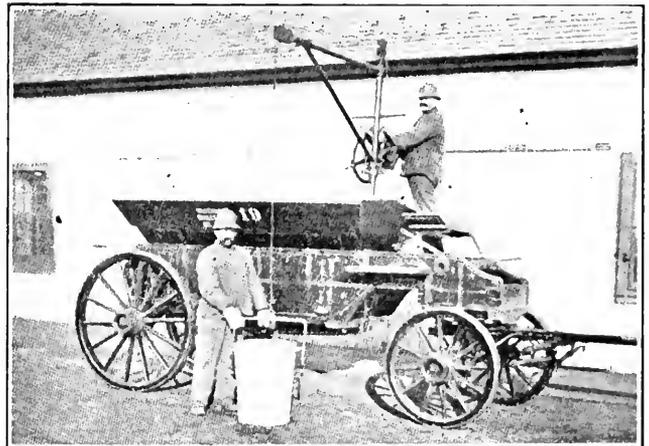

In addition to pavement cleaners, six uniformed men are employed on crosswalks about the city, and one gang of four men with a cart is constantly employed raking stones and picking up paper and rubbish on dirt and macadam streets. It requires two weeks for this gang to cover all the sections once. It is hoped to be able to employ two gangs this year and thus clean all the streets at least once a week.

METER READING DIRECTIONS

THE Water Commission of East Orange, N. J., has issued a six-page leaflet, which it has distributed among all the consumers, giving instructions for reading water meters and advising and urging each consumer "to read and record the registration of your meter regularly at least once every week. By doing so you will be able to detect leaks in the pipes and fixtures in your house and have them repaired before excessive loss has occurred; and also to guard against waste or excessive use of water on your premises. . . . This systematic reading of the meter is urged, first, for your own protection against excessive bills, and second, to avoid friction and misunderstandings with the water department."

"While the water department must necessarily charge you for all the water registered by your meter, it desires that your bills should not be excessive, and asks your co-operation in preventing leakage or waste, which is nearly always the cause of excessive bills. In the ordinary family the water used should not exceed 6 cubic feet or 45 gallons per day for each occupant of your house (including servants), and if you find the meter is registering much more than that quantity we advise that you look into the matter carefully to discover and remedy the cause."

The pamphlet includes a diagram showing a top of a meter and gives instructions in detail for reading the same. It also gives a few suggestions as to where leaks and wastes are most likely to be found in a residence. Such communications as this from a company or water department to its consumers probably assists in maintaining a cordial feeling between the two and inspiring the consumer with confidence that the company or department is not anxious to see the consumer run up large bills but wishes merely to receive pay for the amount of water actually consumed usefully.

DEVICE FOR HOISTING STREET SWEEPINGS CAN

EXCESS CONDEMNATION. ASSESSMENTS

Advantages of the Former—More Equitable to Property Owners and to City—Assessing for Local Improvements

Extract from a paper before the conference on City Planning by Lawson Purdy, President Department of Taxes and Assessments, New York City.

In Europe it has been common to take more land than is required for the immediate public purpose for which land may be taken and thereafter sell it or lease it under appropriate restrictions. This method has been adopted lately in London in the opening of the King's Way and several other streets. In one case the sale of the land acquired bordering the newly open street has entirely paid for the land taken for the street and for its cost. It is expected that in the case of the King's Way the cost of the new avenue will be very slight, if anything, in excess of the money received for the land sold.

In the United States the taking of more land than immediately needed for the particular improvement has been seldom resorted to. An old decision of the New York Court of Appeals may perhaps render it impossible to pursue this policy in the State of New York until the Constitution is amended. An amendment has been approved by the Legislature and if again approved will be submitted to the people in November, which defines the taking of additional, adjoining, continuous or neighboring property as a taking for a public use. The evil to be remedied is grave. When the streets are widened or new streets cut through old parts of the city, irregular and small-sized plots of land are left totally unsuitable for improvement. There are streets in New York today which have been widened for ten years, but still look as though they had been devastated by an earthquake. The reason is that when the map is inspected it is found that there are all sorts of small bits of land in separate ownerships, just as they were when the street was widened. If, when the street was widened, the city had acquired approximately 100 feet more land than was taken for widening, the land could have been sold to advantage, and would have been improved immediately by the erection of suitable structures. The land would have been sold for more than the city had to pay for it. The additional money received would have helped to have paid for the improvement. As it was the property fronting on the street was assessed for the expense of the improvement, and the owners of the property were heavily burdened although unable to reap the benefit of the increased value given to the land by the widening.

When Delancey street was widened a few years ago, lots less than 10 feet deep in some cases were left fronting for 100 feet on the widened street. Adjacent to these lots were other lots fronting on the side streets and lying parallel to Delancey street. Delancey street was widened because it was needed as a great thoroughfare for the approach to the Williamsburg Bridge. The land on Delancey street after it was widened was worth very much more than the land on the side street intersecting it. If the city had taken about 100 feet more land than was required for the widening, the land could have been sold for a profit, the owners of the land so taken would have been saved excessive assessments and the street would have been quickly improved with structures adapted to the new uses demanded by the new conditions.

ASSESSMENTS FOR LOCAL IMPROVEMENTS

It is by no means necessary in all cases for the city to take more land than is required for a street. When the street is opened through property which is not improved, the simplest procedure is the best, and that is to assess the cost upon the property benefited. In order that a city plan may be developed the power to assess the cost upon the property, which is enhanced in value, is an absolute necessity.

In most cities of the country the cost of new streets, including paving and sewerage, is paid for by the assessment of

the cost upon the property benefited. This should be the method in all cities, although power should also be given to the proper local authorities to determine what part of the cost should be borne by the city at large. There are cases where new streets are such a general benefit and the cost so greatly exceeds what would be spent for merely local improvements that it is but just that the city as a whole should bear a part of the expense. Under ordinary circumstances, however, a new street enhances the value of abutting land by a sum much in excess of the cost of the street. There is no injustice, therefore, in assessing the cost upon the property benefited. The general policy of assessment for benefit may well be extended to the payment for the construction of street railway or rapid transit lines. A provision of this kind is now incorporated in the Public Service Commission law of New York.

ESTABLISHING STREET GRADES

SUPERINTENDENT of Streets and Sewers Benj. Chatfield, of Waterbury, Conn., in his report for 1910 calls the attention of the Mayor and Council to a condition of affairs which is found to a greater or less extent in nearly all the cities of this country. His discussion of the matter is as follows:

Although our Charter states that no private or public way shall be opened until lines and grades have been established by the city, this section has never been enforced. Miles of streets are being opened by private persons or corporations in violation of this section in all parts of this city. The lines and grades are made to suit the lots and in a great many cases the whole extent of the grading is the turning over of the turf for a strip of 40 feet in width. Lots are then sold and people commence to build, some believing that the city will accept the street as it is graded, others anticipating that the city will eventually fill or cut in front of their lots, build above or below the present grade.

After a time, improvements are wanted, such as sewers, water mains, curbing and sidewalks, but before these improvements can be made the street must be legally accepted. Petitions are accordingly presented to the various Boards and if not followed closely by petitioners are often laid on the table or referred to various Committees or Boards and lie in this state for months and sometimes years. Building continues and soon the majority of the lots have houses on them.

Every municipal engineer knows the difficulties encountered in establishing lines and grades on streets where houses have been erected. No matter how skillful, he cannot adjust them to the satisfaction of all the abutting owners, nor can he establish them to as good advantage as would have been possible before any buildings had been erected. Owners claim heavy damages for any change in the grade or line. Some have been told, by the selling agent from whom they bought, that there would be no change; others were informed that the greatest change would be six or seven inches. Lines and grades are finally established and one-half the abutting owners are dissatisfied with them.

According to the Charter the city should receive in assessments two-thirds of the estimated cost of grading new streets. This is seldom the case. More often, the city pays two-thirds and the abutting property owners one-third. This extra expense is caused by the building of retaining walls and steps which are not taken into consideration by the Board of Assessments nor the property owners, at the various hearings. It is not until after the street is graded that the majority of property owners fully realize how a 2-foot cut or fill affects their property.

Further on in the report Mr. Chatfield recommends the establishment of at least lines and grades on all main roads to the town lines. "They will have to be established sometime and this can be done at less expense now than later. The land damages would be slight on account of the present small land values and the assessments would not be payable until the road was finally graded, which might be years. Fewer property owners would have to be dealt with and I believe waivers could be secured in the majority of cases." Such lines and grades having been established, not only would future buildings be constructed in a position which could be permanent, but the city could from time to time bring the road to its final grade as funds permitted or as there was a demand for earth for filling or for dumping spots to receive waste earth or ashes.

Sanitation in the South

FIRE insurance companies have for many years united in carrying on investigations and performing missionary work looking to the reduction of fire risks throughout the country—this solely as a business precaution. A combination of life insurance companies to encourage sanitary conditions throughout the country would seem to be equally desirable from a business point of view; and such has been suggested by a representative of a Hartford life insurance company who has recently been investigating sanitary conditions in southern cities in behalf of that company. He visited thirty-two cities, mostly in the south and southwest, and carefully inspected them with referencè to their water supply, sewerage, garbage disposal, food inspection, boards of health, climatic and topographical conditions and the sentiments of the people and officials in respect to municipal sanitation.

He reports in general that southern cities have made great progress during the past ten years and that they are now as a rule paying as much attention to the health of their citizens

and spending as much money in improvements affecting the general health as the cities of the north. Most of the cities have a fairly good water supply, and in many it could be called excellent. The same could be said concerning the sewage systems. There is one respect, however, in which great improvement is to be desired, and this must largely depend upon the creation of favorable public opinion. The extent to which city water is used by all the citizens varies from 20 per cent to nearly 90 per cent, probably 70 per cent being a high estimate of the average percentage of inhabitants of cities of 50,000 or over which use city water. The remaining 30 per cent obtain their water supply elsewhere, mainly from shallow wells, most of which are subject to pollution. The percentage of residences connected with the public sewers is even smaller, and is estimated by the investigator, Hiram J. Messenger, to approximate 60. In two of the cities boards of health have no authority to compel residents to connect houses with the sewer or with the city water mains, even when these are laid in the streets in front of the houses. Laws requiring this to be done have been opposed in some cities by builders and others who complained of the cost of making such connections where the houses have already been provided with wells and cess-pools. Here certainly is room for effective work by civic societies and others. The failure of families to make use of the purer city water and the public sewers is a matter of interest to all citizens, since the contamination from cess-pools is by no means confined to the dwellings or grounds of those using them, and an epidemic of typhoid or other sickness originating in a house using impure surface wells is almost certain to spread to families which have taken the precautions referred to.

Of all the cities visited Mr. Messenger reports Savannah, Ga., as being in every sanitary respect most commendable. Every house in the city, even the most wretched negro hovel, was connected with the city water supply; and every building, except in one small new section, was connected with the public sewers, these facts being learned by personal inspection and not merely from the report of city officials. The Health Department generally, including the bacteriological laboratory, was highly commended for its efficiency and thorough equipment.

It is indeed gratifying that a presumably unbiased expert should report so favorably concerning the precautions being taken by our southern municipalities to safeguard the health of their citizens of all classes.

Ontario Health Laws

THE chief health officer of Ontario, John W. McCullough, has issued a notice to the municipal authorities of that Province calling their attention to the fact that the law requires that the municipal council of any municipality undertaking the establishment of a system of water works or sewerage submit the plans and specifications thereof to the Provincial Board of Health for approval, such approval being necessary to the legality of by-laws for raising the money for carrying out the plans. In the case of a public water supply an analysis of the water is required, which will be furnished by the laboratory of the Provincial Board of Health, which furnishes sterilized bottles for taking the samples.

"Having in view the importance of preserving the pure character of the rivers, streams and lakes of the Province, the regulations of the board strictly provide that garbage, manure, excreta, vegetable or animal matter or filth should not be discharged into or allowed to pollute such waters."

Purchasing Coal by Specifications

THE School Board of Boston, Mass., has for some time been buying coal on specification, but not until recently had it taken any steps to determine whether it was receiving what it was paying for. A few weeks ago it began analyzing the coal delivered and discovered that it was below the stipulated quality. As the result of one analysis, costing \$10, a coal dealer was required to pay the city a rebate of \$873.01 for coal delivered.

STREET LIGHTING IN SEVERAL CITIES

In our issue of March 1 we published an abstract of a report upon street lighting by certain consulting engineers and citizen's organizations of Cincinnati, these reports having been made preliminary to the letting of new street lighting contracts by the city. Shortly after the publication of this article the advertisement for the contract was withdrawn and many of the suggestions contained in the reports abstracted were adopted in modifying the original provisions. Recently a contract has been awarded to the Union Gas & Electric Company, the prices being shown in the accompanying table.

While the study of the problem was being made an investigation was conducted by the Bureau of Municipal Research, blanks being sent to various cities in an effort to collect a considerable amount of information concerning existing conditions and prices. Through the courtesy of J. E. Barlow, of that Bureau, we are enabled to present herewith a tabulation of the information so obtained.

TRAFFIC ON FLEET STREET, LONDON

It has been customary for a number of years to take a census of the traffic for a single day upon some principal London thoroughfares. The same day of the month has been selected as nearly as possible from year to year, so that the enumeration might be made under approximately similar conditions.

One street chosen for the census is Fleet Street, a very important thoroughfare extending from one end of the Strand to Ludgate Circus. It is a convenient and direct route to the city proper, and is traversed by several lines of omnibuses. The

striking feature of the census on Fleet Street (and this would be true in greater or lesser measure of all the other London streets) during the past five years has been the rapid displacement of horse-drawn vehicles.

The traffic of Fleet Street was taken for 12 hours, from 8 a. m. to 8 p. m., on April 19, 1911, and compared to the same period and day in 1907. On April 23, 1907, 4,143 horse cabs and omnibuses passed along Fleet Street and only 1,043 motor cabs and motor omnibuses, while on April 19, 1911, there were 4,300 motor cabs and omnibuses against 486 horse cabs and omnibuses. On the day that the census was taken this year a strike was threatened by the taxicab drivers, so that the number of hansoms in use was in all probability much in excess of the daily average.

On the 1907 census day there were only 48 taxicabs, against 1,902 horse cabs, but on April 19, 1911 the number of horse cabs was reduced to 391 and the number of taxicabs increased to 1,616.

The 62 motor vans passing on Fleet Street on April 19, 1911, was an increase of 106.66 per cent over the number in use on the corresponding day in 1909 and nearly 38 per cent over the number on the April day selected for 1910. The increasing use of motor vans is urged in London because of the great delay that is now occasioned to motor traffic by the procession of heavy horse-drawn wide drays proceeding slowly along the principal business streets, many of which are very narrow and easily blocked.

The total motor traffic on Fleet street more than quadrupled in the four years. On the April day in 1907, 1,126 vehicles passed; in 1908, 2,073; in 1909, 2,302; in 1910, 3,884; and in 1911, 4,481.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

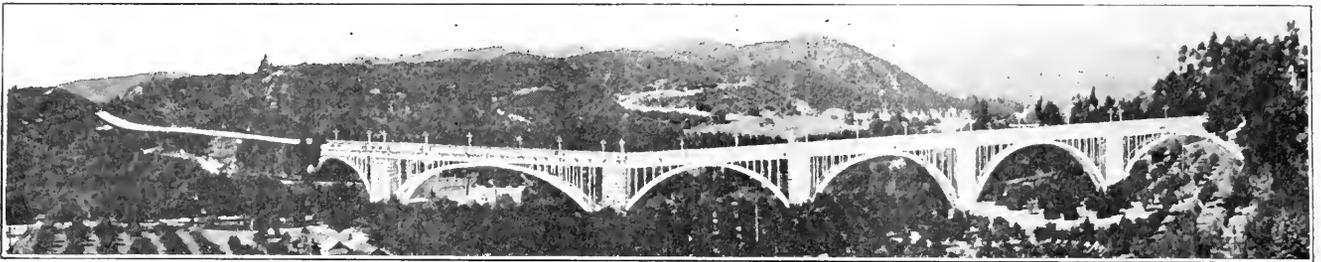

ROADS AND PAVEMENTS

Streets are Oiled on Both Sides at Once

Lexington, Ky.—The oiling of the city streets which was begun about 10 days ago has been pushed rapidly in spite of several days of unfavorable weather, and between 20 and 25 streets have been completed. About 60,000 gallons of oil have been spread to date, and the remainder of the amount contracted for—between 100,000 and 175,000 gallons—which was estimated to be sufficient to complete every street in the city, will be disposed of as fast as it arrives and the streets can be put in condition to receive it. The policy announced by Mayor Skain of oiling but one side of a street at a time has practically been abandoned. The residents of the first streets on which the proposed scheme of oiling but half the road at a time was tried objected to such an operation, and since then the oiling has been almost without exception on both sides of the street at once.

Council Refuses to Accept Street Work

Berkeley, Cal.—Following several protests from residents of South Berkeley, the Berkeley Council has instructed the City Clerk to notify the Southern Pacific Company that the character of rock being placed on California streets was unsatisfactory to the Council and the street would not be accepted. The adverse resolution followed a statement of the conditions on the new street, in which Commissioner Hoff requested the entire Council to visit the work and see for themselves its unsatisfactory character. Hoff was endorsed by Commissioner Norton, who declared that some of the rock had already been condemned by City Engineer Jessup, but that much of an inferior character was still being used. Norton declared that the Southern Pacific Company was as anxious as the city to have good work done, and after scoring the contractors in no uncertain language, he moved the resolution refusing to accept the street.

WEST COLORADO STREET BRIDGE, PASADENA, CAL. ABOUT TWO MONTHS AGO \$200,000 BONDS WERE VOTED FOR ITS CONSTRUCTION. IT MAY INCLUDE THE LONGEST REINFORCED CONCRETE ARCH IN THE UNITED STATES

Thirty-three Miles of Road Built in Three Hours

Trinidad, Col.—Five hundred men and boys with teams, plows, scrapers and graders buidht 33 miles of scenic roadway in three hours one day last week, between this city and Stonewall, a beautiful scenic resort west of this city, at the foot of Stonewall Mountain. The distance was divided into 40 sections and each portion built by 12 or more men and boys in charge of an experienced roadbuilder. Nearly 100 automobiles were used in transporting the workers to the different divisions, and the completion of the task was celebrated by a big open air dinner at Stonewall. Millionaires doffed their coats and worked by the side of scores of unemployed who were given this opportunity to earn a few dollars and a square meal, and 100 or more boys, among them the Boy Scouts of this city and Sopris, aided in the work by clearing the roadway of loose stones.

Safety Station in Street Requested

San Francisco, Cal.—The Board of Works has been asked by the Merchants' Association to provide for a safety station on the south side of Market street, opposite Lotta's Fountain, to accommodate people going to the ferries. It has been thoroughly demonstrated that these stations are no real obstruction to teams and that, on the contrary, they facilitate the passage of vehicles at congested points by requiring them to proceed in orderly lines. The number of people boarding cars there to go to the ferries is very large, particularly during the late afternoon and evening, and these people are subjected to danger from automobiles and passing vehicles, as they have no protection on the south side of the tracks while waiting for a car or boarding the same. The cost of these stations is very small and a greater number of people probably receive more benefit from them every day than from the same amount of money expended on any other improvement.

Supervising Engineer May Be Employed.

Lexington, Ky.—The Joint Improvement Committee was called together for the purpose of considering ways and means of having a supervising engineer appointed to act in conjunction with the City Engineer and his assistants in inspecting the new streets, especially those made of asphalt, which are to be constructed in the near future under contracts let a few days ago. There was not a quorum present at the meeting, but it was announced that in order to save further delay in getting committee action and to bring the question to something definite an ordinance would be prepared and presented at the next meeting of the Council, without any committee action whatsoever. This method of inspection of streets is largely followed elsewhere, especially in the larger cities, and seems to work well, relieving the local Engineering Department of much of the tedious routine work of inspection, such as examining the sand, cement, asphalt and the mixtures of the various ingredients which go into the finished streets.

Disfiguring of Streets to Stop

San Francisco, Cal.—The movement inaugurated in 1908 by the Mission Promotion Association against the disfigurement of the streets in the Mission has been revived, and the assistance of the improvement bodies of the district secured in placing that part of the city in a presentable condition during the next four years. Overhead wires on Valencia and Mission streets, as far southerly as Army street, have been removed during the present year, after strenuous efforts by the Committee on Laws, Ordinances and Charter Amendments, which was appointed by the Association to draft an ordinance requiring the public service corporations gradually to eliminate their poles and wires in the Mission, as well as in other sections of the city. As a consequence of the enforcement of this ordinance the appearance of the Mission streets has been greatly improved.

SEWERAGE AND SANITATION

Easton Makes Semi-Holiday of Big Improvement

Easton, Md.—Business was practically suspended here the day the town started its \$110,000 improvements by breaking ground for its new sewer system. Mayor Higgins lifted the first clod, in the presence of a vast crowd, while speeches were made by prominent citizens.

Sanitary Drinking Fountains Installed

Youngstown, O.—It is pleasing to note the installation of sanitary drinking fountains in different parts of the city, a measure that has been all too long neglected. The sanitary water fountain, which does away with the germ laden drinking cup, is a mark of progress. The dangers of the public drinking utensil have long been apparent, yet the public has been slow to listen to the warning of science against its use. Youngstown now has three fountains of the kind mentioned and they have been made possible by public spirited citizens or organizations who have done the city a great service by installing them. Such an example should be followed by other like gifts, for which there is much room and of which there is a great and growing need.

Board of Health Orders Clean-up

South Bend, Ind.—South Bend is to undergo a renovation, according to a notice issued by the Board of Health. With the hot days the danger of disease from accumulated garbage and rubbish is greatly increased, and the Board intends to strike at the root of the greater amount of sickness by preventing it altogether. The order calls for the sending of all table refuse, decayed meats and fish and dead animals to the city crematory. Ashes and other rubbish may be dumped in the city dumps at the foot of the Sample street bridge or in Leeper Park dump. Private dumps are permitted where the refuse is kept covered, but garbage, dead animals and decayed fish and meat cannot be so dumped but must be sent to the crematory. Officers of the Health Board state that it is the intention to enforce the law and prosecution will follow failure to observe it.

Authorities Order Open Wells Filled Up.

Chattanooga, Tenn.—The city health authorities are now beginning a campaign against the open well, to the end of having every one of them filled up. It will prove surprising to everybody to learn that there are probably 120 open wells now in the city from which the people are using water. In the opinion of Commissioner Evans, an opinion that will be shared by every citizen who is posted in matters of sanitation, there is no one thing more dangerous to the health of the city than the practice of drinking water from an open well. Aside from the fact that the city has outgrown the day of wells, it is a scientific truth that pure water can hardly exist in a well in a city the size of Chattanooga. There will be no delay in removing the menace of the wells. Within 48 hours from the receipt of the instructions by the Chief of Police it is expected that there will not be an open well within the corporate limits.

Plan Campaign to Prevent Disease

Dallas, Tex.—Dallas is to have an educational course in sanitary and clinic measures proper for preventing the spread of contagious or infectious diseases. This much seems assured from a joint meeting of the Board of Health, the Board of Municipal Commissioners, the Red Cross, the United Charities and other organizations. Following reports from the sanitary inspectors concerning conditions in the city, and statements from physicians about conditions in the schools and measures needed to improve the general health of the children, there was discussion of plans and a committee was appointed to prepare for a general mass meeting to be held at some early time before the opening of the city schools for the work of a new year. The purposes of the mass meeting will be to deliberate upon measures for securing nurses and physicians for inspection work in the city schools, the need for the new city hospital and more adequate facilities for handling the tuberculosis troubles in or out of the schools, and the bettering of sanitary conditions.

WATER SUPPLY

Town Aims to Condemn Water Works System

Pasco, Wash.—The City Council has passed an ordinance to third reading, providing for the purchase of the city water works from the Pacific Power and Light Company by condemnation proceedings. The Council wants to push the matter through, acquire the plant by eminent domain proceedings, and bring it up to a high state of efficiency, as it is now inadequate for the city's needs.

Filtration Plant Nearing Completion

Rensselaer, N. Y.—The extensive improvements under way at the filtration plant of the Rensselaer Water Company are progressing and will probably be completed early in the fall. The improvements include a one-story brick building which will be equipped with a new filter. The additional facilities will provide for the filtering of 1,000,000 gallons of water in 24 hours. When the improvements are completed, Rensselaer will have one of the best filtration plants in the country.

New City Water Found Pure

St. Paul, Minn.—Water from the new wells at McCarron Lake, which was turned into the city supply last week, has been analyzed by the Bacteriological Department of the Health Department and found to be an ideal drinking water. Report on the analysis is that from both the chemical and bacteriological standpoints the water is good. Water Board members say St. Paul's reputation for supplying pure water will remain unchanged by reason of new sources of supply.

Pure Water Furnished Citizens of Knoxville

Knoxville, Tenn.—The fact that Knoxville is furnishing its citizens the purest of water is proven by the analysis of the water, according to reports on file in the office of the Knoxville Water Commission, showing the true condition of the water each day in the year except Sunday. These reports and examinations are made by Dr. William R. Cochrane, secretary of the City Board of Health. The reports are open for inspection and so is the entire plant. For the past few weeks local physicians have been advising their patients to boil the water, and this advice, and the story of a break in a sewer, have caused untold rumors to spread all over the city, until it has driven some people to the point of using well water, spring water from White Spring, and other springs near the city which may perhaps cause sickness.

Peril in Leaky Reservoir

Pittsburg, Pa.—One of the city's large reservoirs in Highland Park, having a capacity of 120,000,000 gallons a day, has been condemned following an inspection by the members of Pittsburg's new Council, Mayor William A. Magee and Joseph T. Armstrong, director of public works. Each of the officials expressed surprise that a bad accident had not occurred, and Director Armstrong said: "Acceptance of such a piece of work by the city, to be paid for out of tax money to the people, was a crime." The reservoir was completed a number of years ago at a cost of over \$500,000. Great holes and cracks line the entire basin, and close to \$200,000 will be necessary, experts say, to repair and make it safe. Meanwhile, the reservoir will be abandoned.

To Insure Purity of the Water

Portland, Me.—The trustees of the Portland Water District have filed with the register of deeds and County commissioners papers in initial proceedings pertaining to the taking by right of eminent domain of land at Sebago Lake, in the vicinity of the intake, on both side of it, sufficient to fully protect the interests of the district for years to come. The property taken extends from the location of the Mountain Division of the Maine Central Railroad to Chadbourne's Landing. Papers are in preparation providing for the taking additional land extending a half mile along the shore of the lake, so as to make altogether a stretch of about a mile and a half, on both sides of the intake. The object of this is to insure the purity of the water for the consumers of the district.

Water Meters Save Money

Spokane, Wash.—A record in water meter installation has been made by Commissioner of Public Utilities C. M. Fassett. A report from the construction department before him last week shows that 630 meters were installed voluntarily by property owners at their own expense between January 1 and June 1. This is an average of 116 a month, breaking all records. The rate of installation is increasing, the report showing that so far this month 140 meters were installed by request of water consumers. The rush for water meters is caused by the spreading conviction among the consumers that buying water that way is the most economical way.

Steps Taken to Avoid Water Shortage

Tacoma, Wash.—Seeking to avert a serious water shortage, Commissioner B. J. Weeks, of the Department of Light and Water, has issued a warning to all patrons of the city system to use extreme care to prevent any unnecessary waste. Special night and day inspectors will patrol all districts where sprinkling is done and any violations of the old sprinkling ordinance or any of the regulations of the department will be penalized. Automatic sprinklers will not be tolerated; the hose must be held in the hand when sprinkling and, as in the past, extra charges for sprinkling will be levied during June, July and August.

Municipal Water Plant Nearly Completed

Gadsden, Ala.—The great pressure pumps are being placed in the municipal waterworks plant and it will require something like three or four weeks to complete the work. All operations around the plant are progressing very satisfactorily and the plant will be completed by or before August 1. It is expected that the new pumps will be put in operation within the next two or three weeks, but they will be run for some time, in order to get all the adjustments perfect, before turning them over to the city. The pumps are high duty cross compound, fly wheel extended type pumps, with a capacity of 3,000,000 gallons each 24 hours. Not all this water will be required for the present and the plant will be able to furnish the city with water after the population is more than doubled.

Officials Inspect Watershed

Rochester, N. Y.—An inspection of Hemlock and Canadice Lakes was made last week by Mayor H. H. Edgerton, Commissioner of Public Works F. T. Elwood, City Engineer E. A. Fisher and reporters representing each of the daily newspapers of the city. The feature of the trip was the declaration of the Mayor that a third conduit is soon to be laid from Hemlock to the city. There are now two conduits from the lake to the city. The third conduit will be a positive assurance that the city will never have its water supply cut off, and will provide a greater pipeage from the source of supply to the center of consumption. The capacity of the present conduits is now taxed in supplying the demand for water.

City Water Found Free from Contamination

Columbia, S. C.—The report on the Columbia Waterworks Department, submitted by Mr. William A. Boyd, city health officer, is of particular interest in view of the fact that Columbia was recently the scene of the meeting of the State Waterworks Association. It embodies the report of the bacteriologist in charge of the department who makes daily examinations of the water and who pronounces it absolutely pure. Dr. Boyd brings out the fact that both by nature and by treatment the city water is peculiarly free from contamination, either bacterial or chemical. The water supply is obtained from the Saluda River, which runs for miles over a sandy and rocky bed, with many bends, thus facilitating the natural sedimentation and purifying of its waters. The water is pumped from the Saluda River into a large settling basin, which holds a supply sufficient for two weeks' ordinary use; so that that the water undergoes a settling process of at least one week. Recent researches have shown that the simple storage of water will purify it. From the settling basin the water is delivered to the coagulating basin, where it is treated with aluminum sulphate (filter alum), two grains being used to the gallon of water.

STREET LIGHTING AND POWER

New Street Lighting System Being Put In

Eric, Pa.—New street lighting system is being installed in this city by the Cleveland Street Lighting Company for the Eric Gas Company's lights. Old globes are changed for new ones, and new burners are being replaced. These are fitted with automatic lighters, and it is expected that the new system will afford 100 per cent more illumination. Colored globes will be placed near fire alarm and police patrol boxes. Colors red and green will be used, red for the fire alarm boxes and green for the police patrol boxes.

Public Service Company Ready to Remove Wires

Hoboken, N. J.—As a result of action by the Public Service Electric Company in writing to the Hoboken Street Commissioner on the proposition to remove overhead wires, there now seems to be a chance of the electric light wires coming down on several streets at least. The Public Service Electric Company is ready to proceed with the work of constructing subways and underground conduits for a system of underground distribution and is ready to commence work promptly. It will take about three months to complete the laying of the ducts and the construction of the manholes. The company, of course, will protect its openings and assume all responsibility of damage occurring from the prosecution of the work.

City Demands Lower Rates From Gas Company

Baltimore, Md.—Unless the Consolidated Gas, Electric Light & Power Company elects to reduce its rates for gas and electricity by July 15 the city will make application to the Public Service Commission for a thorough investigation of the company's business. This decision was reached by Mayor Preston at a conference with City Solicitor Edgar Allan Poe. The conference followed a meeting of members of the Public Service Commission and Mr. Poe. The company will be advised immediately by Mr. Poe of the city's intentions. Although the city's future course with respect to the matter will be based on the company's willingness or unwillingness to make reasonable reductions in its rates, the conference between the Mayor and the City Solicitor did not reach any definite conclusion as to what would be considered "reasonable" in the way of a reduction. It is believed that the city officials have in mind a reduction in gas rates from 90 cents per 1,000 cubic feet to at least 85 cents, and perhaps 80 cents, and a general revision of the electric rates for industrial use. The decision of the Mayor to give the company until July 15 to make reductions is the first definite step taken toward a solution of the rate question. For more than a year the matter has hung fire, while the city, though employing experts for the purpose, has accomplished nothing in the way of bringing the case to a head.

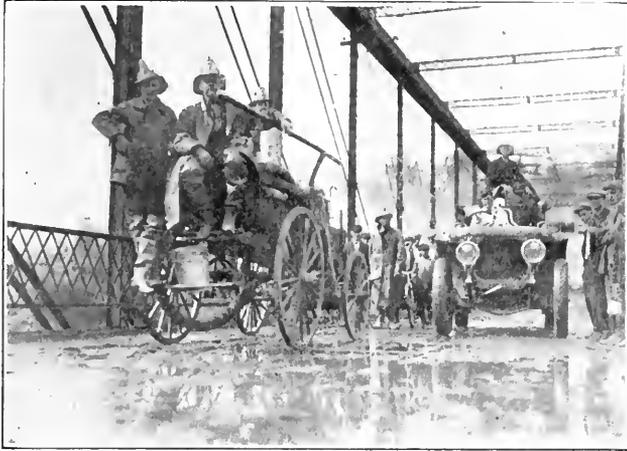

Municipal Lighting in Lansing

Lansing, Mich.—The annual report of the City Water and Electric Light Board of Lansing is a very satisfactory document to the taxpayers of that city. The two systems are conservatively valued at \$800,000 after depreciation is allowed for. In 1885 the city issued \$125,000 in bonds to buy the waterworks and in 1892 issued \$60,000 in bonds to buy the electric lighting system. Of these bonds \$75,000 has been paid. The annual report shows that for the fiscal year ending May 31, the electric light plant earned \$117,926, an excess of \$55,079 over the operating expenses of \$62,846. There is \$13,318 in cash in the treasury and the waterworks fund has been loaned \$19,183. During the year \$12,000 has been paid for a new turbine engine, \$8,216 for new boilers and \$7,500 for a new generator, showing that the board is keeping the plant in first-class condition. The earned receipts for the fiscal year of the waterworks system were \$75,710. The total payment for operating expenses was \$28,086. During the year there has been expended for construction, extension of mains and new wells \$45,793, the board having devoted the year to extensions which the growth of the city made necessary, but it is to be noted that there is an excess of \$47,623 in earnings over the operating expenses, which shows that the plant is capable of providing funds with which to make these extensions. Municipal ownership of both these utilities, but especially of the lighting plant, has been a conspicuous success.

FIRE AND POLICE

Ancient and Modern Fire Apparatus Used Side by Side

Lowellville, Ohio.—Lowellville was all but wiped out one night last week when a fire swept an entire block. Dynamiting, the services of the Youngstown Fire Department, added to that of the volunteer department of Lowellville, saved the day. The flames, when they were stopped, were sweeping along the river carrying everything before them, and Lowellville on that side of the river seemed doomed. It was only by the heroic efforts of the volunteer firemen that the flames were stayed until help could be secured from Youngstown and its department. A small Howe en-

Courtesy Youngstown Telegram

ANCIENT AND MODERN FIRE APPARATUS USED AT LOWELLVILLE FIRE

gine hand pump and a bucket brigade was the only protection against fire. The pump had not been used for some time and neither had it been inspected. It failed to respond readily, and but for the arrival of the Youngstown Fire Department's auto truck little would have remained of the section of Lowellville lying south of the Mahoning River. The sight of the ancient and modern fire apparatus working side by side attracted a great deal of attention.

New Police Patrol System

New York, N. Y.—Police Commissioner Waldo has announced that the plan of placing policemen on stationary posts where they might be found at any hour of the night would be tried in one of the inspection districts. It is the belief of Commissioner Waldo that a stationary policeman will prove of greater benefit to the city than two policemen covering posts which may take them through half a dozen side streets and into one or more avenues. By the plan proposed by Commissioner Waldo there will be a policeman within two blocks anywhere in the Third Inspection District. These policemen will remain on post for four hours, when they will be relieved for the next four hours.

Auto Fire Engine Arrives

Long Beach, Cal.—Information has been received by Fire Chief Shrewsbury that the \$8,500 fire automobile pumping engine, which the city ordered some time ago, has arrived from St. Louis. This will be the only engine of its kind on the Coast. The fire department will give a public test, at which the fire chiefs of Southern California will be in attendance.

Improving Fire Alarm Service

San Francisco, Cal.—An improved method of increasing the prominence of the locations of fire alarm boxes throughout San Francisco is being effected by the Department of Electricity. Globes painted red are being placed on electric arc lights, and will be lighted during all hours of the night and early morning. The same result during the day has been secured by carrying the bright color of the alarm box itself entirely around the pole supporting the alarm box. The Department of Electricity announces that 50 of the latest style fire alarm boxes have been received and will shortly be placed in commission.

Auto Engine Proves Superior to Steam Fire Engine

St. Louis, Mo.—A fire, June 16, fanned by high winds, destroyed eight acres of factories, warehouses and lumber yards and caused a million dollars damage. A general alarm summoned all available fire fighting apparatus in the city to the scene. Two motor engines of the new type were put in operation and did remarkably effective work. The test was the longest and most severe to which the automobile engines have been subjected in St. Louis. One engine, directed by A. C. Webb, the former automobile racing driver, who is head of the company that constructed it, ran eight and one-half hours without a stop. It furnished two streams that were declared by firemen to be superior to any thrown by the steam engines at the fire. This one engine consumed 40 gallons of gasoline as fuel during the run and kept the two streams at a constant pressure of

LUMBER YARD FIRE, ST. LOUIS, MO.

150 pounds to the square inch. Chief Swingley was enthusiastic over the effective work of the new engines.

GOVERNMENT AND FINANCE

Aldermen Vote an Increase in Taxation

Burlington, Vt.—The Board of Aldermen in special session has voted a tax rate of \$1.75 for 1911, and passed the tax budget, calling for the estimated expenditure of \$344,247.05. The tax rate is five cents more than last year and the reason therefor is an attempt to reduce as much as possible the city's floating indebtedness.

City Comptroller Files Report

Tacoma, Wash.—According to the monthly report of City Comptroller J. F. Meads, filed with the Municipal Commission, it cost the city nearly \$195,000 to operate various departments in May. This brings the total expenses for the first five months of the year up to almost \$500,000. The estimates for the year were \$905,521.40. Expenses of various departments for the month were: Health and sanitation, \$2,864.80; finance, \$9,889.48; public safety, \$24,252.66; public works, \$23,308.92; water, \$117,362.23; light, \$85,570.56. Light receipts for May were \$105,668.08, while water receipts were \$83,932.60. The actual cash balance on hand as shown by the controller's books on June 1 was \$3,192,792.22.

Spokane Spends Vast Sum

Spokane, Wash.—More than \$17,500,000 will be expended on municipal and railroad work and building operations in Spokane this year, and of this amount the city's share is approximately \$6,000,000. The Chicago, Milwaukee & Puget Sound, the Northern Pacific and the third division of the Oregon-Washington Railroad & Navigation Companies have plans for work costing \$6,500,000 and architects and contractors estimate that fully \$5,000,000 will be invested in new buildings before the close of the year. Municipal work in progress or confirmed amounts to \$1,721,280 to date, and in addition there is \$3,936,280 for bridges and buildings, as follows: City Hall, \$665,000; South Central high school, \$450,000; Monroe street bridge, \$450,000; Latha bridge, \$245,000; reservoir, \$150,000; fire stations, \$40,000; isolation hospital \$25,000.

Mayor Ordered by Court to Call Special Election

Walla Walla, Wash.—Mandamus ordering Mayor Eugene Tausick to call an election to submit the commission form of government under the Allen law, to the people of Walla Walla has been granted by Judge Brents of the Superior Court. The decision was accompanied by the expression that the case would be carried to the Supreme Court in any event; and that had he the final decision, he would declare the law unconstitutional.

Commission Government for Trenton

Trenton, N. J.—Trenton has adopted the commission form of government, abolishing the offices of Mayor and Common Council and placing the whole of the government in the hands of five Commissioners to be elected within the next two months. Because of a campaign unequalled in recent years for bitterness, an unusually large vote was polled, and interest in the contest continued unabated until the result of the contest was announced. The vote as recorded was 6,792 for and 4,890 against. Only four of the fourteen wards of the city voted against the plan. Party lines were completely broken. The next move will be to nominate and elect the Commissioners and then the new form of government will be put into effect.

Small Council Takes Place of Large

Scranton, Pa.—Scranton's Council of five members was inducted to office one day last week and in a few minutes the legislative branch of this government changed from the old order of 62 members in two branches of council to one body of five members. P. P. Jordan, former selectman from the Eighth Ward, was elected president of the body, the salary was fixed at the minimum figure, \$2,000 a year for each councilman, and a fine of \$5 provided for to be imposed on members who miss regular or special meetings of Council or committee sessions. The act of assembly creating the Council of five fixed the maximum salary of councilmen at \$6,500 a year and the minimum salary at \$2,000 a year. The Council was given the power to fix the salary between these figures. The salary was fixed at \$2,000 which will remain during the term of office, the act providing that the salary cannot be raised during the tenure of office.

City Run by Manager

Staunton, Va.—From Virginia comes the novelty of municipal government administered by a general manager whose prototype is to be found in every large corporation. This scheme is a modification of the commission form of government. Three years of experimentation have been satisfactory to Staunton, with a population in excess of 12,000, and one of the most enterprising communities in Virginia. When, in March, 1908, it was decided to give the general manager a chance, it was argued that councilmen, having their private affairs, could not reasonably be expected to give their time and service gratuitously to the community. This, it was pointed out, led naturally to indifference and to the administration of affairs by a select few or by contractors interested in public work. Under the new plan it is reported that this system of favoritism is a thing of the past. The constitution of Virginia requires cities to maintain their Mayor and Council and in cities of the first class, those having a population of 10,000 or more, two branches of the Council are required. Therefore, Staunton was unable to abolish the Council and adopt a commission form of government. However, as the provisions of the code permit the Council to establish such offices as may be necessary to conduct properly the city's affairs, the idea of a general manager was conceived. The general manager devotes his entire time to the duties of his office and has entire charge and control of all the executive work of the city in its various departments, and entire charge and control of the heads of departments and employees of the city. He makes all contracts for labor and supplies and in general performs all of the administrative executive work usually performed by the several standing committees of the Councils, except the Finance, Ordinance and Auditing Committees.

STREET CLEANING AND REFUSE DISPOSAL

City to Collect Garbage at Night

Trenton, N. J.—Council's Police Committee has concluded to try out the plan of collecting garbage and ashes at night. This subject has long been agitated in Trenton, but there was always the objection that conditions were different here and that the city could not be compared with those municipalities in which such innovations had been successfully undertaken. Now, however, the conclusion has been reached that the time is ripe for night collections and they will begin next week. It is proposed to continue the plan through the summer, at least.

Street Department Adds New Equipment

Lexington, Ky.—Recently the Lexington Street Cleaning Department has taken on an aspect characteristic of the larger cities and lately, when several little push carts in which to sweep the trash were added to the equipment of the white garbed street sweepers, pedestrians smiled pleasantly at the city-like scene they presented. Several street sweepers have been put in the business district to keep the streets swept clean during the day, while the sweeping machines continue to clean up in general during the night.

Garbage Company to Have Competition

Akron, O.—Akron is likely to have competition in the garbage collection business as a result of the big increase in prices that has been exacted from the public by the Akron Garbage Co. in the past few seasons. The rate which Akron people must pay this year for garbage collection service is 20 cents a week. Not long ago the rate was 10 cents a week, showing an increase of 100 per cent in a comparatively short time. In many cities where garbage disposal has been systematized the garbage itself pays for the service of taking it away, and there are many private individuals glad to take away garbage for the privilege of disposing of it. A number of Akron citizens are now studying the Akron situation and believe they could easily get most of the local garbage business at the rate formerly charged Akron people and get a good profit out of the business. It is probable that a company will be organized.

Protest Against Collection of Garbage without License

Long Branch, N. J.—The collection of garbage by outside parties has caused a protest to be made by the Sea Board Utilization Company, which has the city garbage contract. Complaints have reached E. E. Taber, sanitary inspector, and at a recent meeting of the Board of Health Inspector Taber had a number of garbage collectors before the Board. David Groves, who represents the Utilization Company, was present to interpose his objection, calling attention to the fact that although his company was authorized to collect the city's garbage, people from Eatontown and other nearby places were removing garbage from the city limits without paying a license or complying with any of the health ordinances. A number of those who have been operating without a license were notified by Inspector Taber to cease operations until the Health Board could decide the matter. A special meeting will be held for the purpose.

City Will Improve Reduction Plant

Ft. Wayne, Ind.—The board of public works have investigated conditions and have found that it costs the city considerably less than \$1 to reduce one ton of garbage, instead of the \$1.60, claimed by the health department to be the expense. At that, though, according to the board members, the plant is far from an up-to-the-minute institution, and some effort will be made within the next few months to correct this condition. A drying room at the plant, it is claimed, would solve the question, at least temporarily, by expediting the incineration of the garbage, as well as reducing the cost by at least half.

Considering Purchase of Auto Truck for Garbage

Toledo, O.—It has been suggested to the public improvement committee to buy an automobile truck for the purpose of transporting the garbage to the plant and the committee likes the idea, but referred the matter to Service Director Cowell for his approval. A truck holding ten tons can be secured for \$5,500 and will make six miles an hour when loaded and ten miles an hour when empty.

RAPID TRANSIT

Electric Power for Mountain Incline Road

Chattanooga, Tenn.—As soon as quick work can turn out the motors and other machinery necessary and the same can be shipped to Chattanooga, the Lookout Mountain incline cars will be hoisted by electric equipment and the old cable system will be discarded. The new cars are already on the ground, ready for installation into service. They are larger than the old and handsomer. Freight will be carried inside the cars instead of upon a platform on the outside, as the old arrangement has been. There will be two motors, each of them of 200-hp. capacity, and each able to alone handle the average load up the mountain. There will be the best of safety appliances that mechanical skill can contrive and the schedules will be much reduced when the new cars are put into operation. Possibly the arrangement that will appeal to the mountain people as the most beneficial to them will be the final plan of handling freight to the top of the mountain. As soon as the new machinery is installed on the passenger incline the company will begin operations to install the old machinery on the old incline and freight will then be handled to the mountain top in carload lots, and naturally at greatly reduced rates. The company has summer rates now in effect on the incline, and the usual heavy traffic of the heated term is being handled.

Plan Big Extensions of Street Car Lines

Salt Lake, Utah.—The Utah Light & Railway Company is preparing to spend many thousands of dollars in improvements and extensions during the year commencing July 1. The fiscal year for Harriman properties runs from July 1 to July 1, and there is an inflexible rule that appropriations made for one year cannot be drawn upon until that year commences. Just now the street railway company is engaged in extending the West Temple street line two blocks south from Tenth to Twelfth South streets, and repairs are being made on South Main street, between Second and Third South streets, where a crossover has been taken out to make the track smoother. The old 72-pound rails on First and Second South streets, between State and West Temple streets, are to be replaced with 80-pound rails on new ties laid in a bed of concrete. The cobblestones between the rails are to be replaced with asphalt. The work is already in progress on West Second South street and the surveys have been made for the First South improvements. The old rails were put down fifteen years ago and are considerably worn. After July 1 the East Second South or Mt. Olivet line is to be extended six blocks from the present terminus. This will afford street car service to the high school and Judge Mercy Hospital, which is now two blocks from a car line. The proposed Halliday extension of the Sugar House line will be five miles long. It will run out the county road, south, through Highland Park. The company has until September, 1912, to complete this line and Manager Wells does not know yet whether the road will be built this year or next. A branch will likely be run south through the center of Highland Park when that section is built up next year. An extension of one of the south end lines to the proposed new Country Club's golf links in the foothills near Fort Douglas is also contemplated for next year.

City Awarded \$51,612

Boston, Mass.—In a suit brought by the city of Boston to recover the cost of installing elevators and machinery in the Atlantic avenue station of the East Boston tunnel, Judge Fessenden made a finding of \$51,612 in favor of the former. The Elevated claimed that the Transit Commission should pay for the elevators and machinery inasmuch as that body was required to erect the stations and approaches. The road claimed that the elevators were approaches. The city claimed further that the elevators were means of communication between the tunnel and the street and the elevated level, for which the company was liable. This suit grew out of the wish to avoid delay in opening the tunnel and the Transit Commission agreed to pay for the installation of the elevators, if the company would leave the liability to a court decision.

MISCELLANEOUS

Red Light Is Auto Insurance

Chicago, Ill.—Street cleaners on Michigan boulevard have adopted a new method of keeping out of the path frequented by automobiles at night. They have a miniature electric light globe pushed through the top of their hats, with a battery in their pockets and wires connected through the hat. The globe is red. The City Department, as well as the hotels and clubs along the boulevard, insist on cleaners working on the street all evening, and several have been struck and seriously hurt by machines. At first they had just common white lights on their hats, but drivers took them for cigarettes.

Water in Auto Tanks Is Carried to Horses

Philadelphia, Pa.—Thirty drinking stations for horses have already been opened by the Women's Society for the Prevention of Cruelty to Animals, the inauguration of the summer relief work being marked by ceremonies at Broad and Arch streets. The relief station at that point was dedicated to Archbishop Ryan. The ceremonies also marked

Courtesy North American, Philadelphia, Pa.

AUTOMOBILE SERVICE FOR WATERING HORSES

the establishment of an automobile service for furnishing water to horses on Market street. Owing to the heavy traffic, both on the street and on the sidewalks, it has been deemed inadvisable to place watering troughs on Market street. The society therefore has inaugurated the automobile tank wagon service to give relief to the horses. Buckets are carried on the tank for watering horses at any point on the street.

New Soil for Central Park

New York, N. Y.—Central Park soil is to be improved at once. At the request of Park Commissioner Stover and after hearing a report on the condition of the soil, the Board of Aldermen authorized the issue of \$150,000 in corporate stock for the adoption of the recommendations contained in the report. As it will take time to carry out these recommendations, the Board decided to appropriate \$50,000 immediately for the work, and to apportion the remaining \$100,000 for next year and the year after. The new treatment will consist in part of plowing up the open spaces and wornout sections, particularly, and sowing them in clover and other grasses, to form a heavy turf, which will hold moisture.

Park Addition To Be Donated

Youngstown, O.—Through a donation of land, which will be made at an early date by Horace Williamson and B. M. Campbell, the city of Youngstown will come into possession of about 15 acres of land adjoining South Side Park. The land in question will make an excellent addition to the South Side Park, inasmuch as the greater part of it is covered with large trees, which will tend to make up for the inadequate shade the park now affords. With this addition, the park will comprise about 22 acres and can be converted into an ideal pleasure spot. The Park Commission has been desirous of procuring this portion of the realty company's land for some time, but owing to the figure at which it was held it was thought that the city could better do without for the time. The name of Williamson Park will be suggested to the Park Commission as a courtesy to Horace Williamson, who will be one of the donors of the land. Mr. Williamson has also done much toward advancing the civic conditions of that section of the city.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Disposal of Refuse—Contracts

City of New York vs. Paoli et al.—A contract by the Street Cleaning Department of New York City selling the privilege of picking over refuse at the city dumps is a valid exercise of power.—Court of Appeals of New York, 94 N. E. R., 1077.

Regulating Working Hours of Municipal Employees

In re Opinion of Justices.—The Legislature may, subject to constitutional limitations, control the counties, cities and towns of the State, and direct the method by which they shall conduct their public business, and it may restrict employees on public works to eight hours per day. Supreme Judicial Court of Massachusetts, 94 N. E. R., 1044.

Defects in Alley—Liability

Dallas vs. City of Concordia.—A city which knowingly permits a deep cellarway to remain open and unguarded in a public alley, a few feet from a principal street, is responsible in damages to one who in the darkness of night and without negligence falls therein.—Supreme Court of Kansas, 115 P. R., 558.

Personal Injuries—Obstructions—Cellarways

City of Lewiston vs. Isaman.—The provisions of the city charter expressly authorized the construction of cellarways and the placing of doors thereover, and it is the duty of the city to keep such doors, which are a part of the sidewalk, in repair, if the owner fails to do so, and assess the expense thereof to the abutting lot. The obligation and duty to keep the streets and sidewalks in a safe condition is placed by the provisions of its charter upon the city, and the city has been provided by said charter with authority and power to discharge such duty, and, in case it fails to perform such duty, the city is made expressly liable, under the provisions of the charter, for any damage to person or property.—Supreme Court of Idaho, 115 P. R., 494.

Sewer Assessments—Ordinances

Kirkpatrick vs. City of Dallas.—An ordinance providing that the cost of sewers shall be assessed to the property abutting on the streets where the same are laid and benefited thereby does not, at least clearly, indicate exercise of the power, under the city's charter, optional with the Council, to assess property adjacent to, as well as that abutting on, the streets in which a sewer is laid.—Supreme Court of Oregon, 115 P. R., 424.

Dedication of Streets—Acceptance

Wade vs. Town of Cornelia.—Where the owner of an acre of land located in a municipality subdivides the same into lots and streets, and dedicates the streets to public use, and the municipality accepts the dedication by working the streets and otherwise exercising control over them, the municipality acquires, for the benefit of the public, an easement in the use of the streets.—Supreme Court of Georgia, 70 S. E. R., 880.

Sewer District—Sufficiency of Ordinance

Williams vs. City of Caldwell.—Where a city ordinance declaring the intention of the Council to organize a sewer district and construct a sewer system states that "the character of the proposed lateral system shall be that of gravity and according to the plans and specifications now on file in the office of the city engineer," it is a sufficient compliance with the terms of subdivision 3, section 2353, Rev. Codes, which requires that the ordinance of intention shall state the "general character of the proposed sewerage system and sewerage disposal works." In such case the reference to the plans and specifications is sufficient to give notice to all parties interested of the general character of the proposed works.—Supreme Court of Idaho, 114 P. R., 519.

Grading Street—Injury to Building

Meyer et ux. vs. City of Rosedale et al. The measure of damages for injuries done to a building may differ according to the facts in each case. Under the evidence in this case the rule prescribed by the court that the amount of damage, if any, should be the cost of restoring the building to the same condition in which it was before the injury occurred is the correct rule.—Supreme Court of Kansas, 113 P. R., 1043.

Contract for Purchase of Voting Machines

Darling vs. City of Manistee.—Where a contract by a city for the purchase of voting machines required them to be returned to the seller if they did not comply with the conditions it must be deemed to have accepted them in full compliance with the warranties in the contract if it kept and used them, without complaint or offer to return, for three years after the contract was made, it being the city's duty to return them within a reasonable time if they did not comply with the contract.—Supreme Court of Michigan, 131 N. W. R., 450.

Supplying Water Outside of City

Steitenroth et al. vs. City of Jackson.—A municipality owning and operating a water works plant has no power to supply water to persons living outside the municipality, and such a power does not result by necessary implication from the power the municipality to supply water to its own citizens.—Supreme Court of Mississippi, 54 S. R., 955.

Defective Sidewalks—Gratings

Corry vs. City of Columbia.—Even if a city must so guard gratings in a sidewalk, reasonably necessary for adjoining buildings, that one wearing a small heel shoe or using a cane or crutch may not be endangered by a fall from the heel, cane or crutch going into one of the small openings, a corresponding duty must devolve on such pedestrians to exercise due care to avoid such danger.—Supreme Court of South Carolina.

Obstruction of Street by Railroad—Injunction

Town of Cheraw vs. Seaboard Air Line Ry.—An injunction, at the suit of a municipality against a railroad for obstructing a street, should not be granted where there is a prima facie showing that a side track used and claimed by the railroad was constructed within a right of way granted by the municipality, and where the existence of any nuisance is doubtful and has not been established by law, and where there has been an injunction in a suit between the defendant and a third party claiming to derive its rights from the municipality over the same obstruction.—Supreme Court of South Carolina, 71 S. E. R., 40.

Personal Injuries—Unguarded Trench

Robinson vs. Town of St. Matthews.—Under Civic Code 1902 a municipality is liable for injuries through a defect in a street occasioned by its neglect or mismanagement. The neglect alleged was in digging a ditch in a street to a depth dangerous to ordinary travel and leaving same uncovered and unlighted. Held, it was not error to fail to instruct that it is discretionary with a municipality to place permanent lights in a street, as the case presented not merely a failure so to do, but a defect in the street as a result of neglect in leaving an uncovered and unlighted ditch in a street.—Supreme Court of South Carolina, 71 S. E. R., 234.

Payment by Warrant

Hart et al vs. Village of Wyndmere et al.—The delivery by a village of its legal warrant in payment of a contract, providing for payment by it in cash, is payment of such contract obligation.—Supreme Court of North Dakota, 131 N. W. R., 271.

Change of Grade—Damages

Filer & Stowell Company vs. City of Milwaukee.—Under Milwaukee City Charter, providing that where the grade of a street has once been established, and the owner of any lot is injured by an alteration of the grade, he shall be entitled to compensation therefor; the grade of a street, once lawfully established, cannot be legally changed without proceedings for the determination of the damages and benefits.—Supreme Court of Wisconsin, 131 N. W. R., 345.

MUNICIPAL APPLIANCES

An Automatic Float-Switch

AN automatic float-switch of new design has recently been placed upon the market by the Westinghouse Electric & Manufacturing Company. The new design embodies several features that recommend it for the control of motors driving pumps that empty into reservoirs, or drain pumps, sewers, etc. The operation of the switch is entirely automatic and the mechanism requires no attention beyond an occasional inspection and oiling. The switch is operated by a cylindrical steel float which plays between brass stops on a vertical rod, as shown in the cut; the stops are adjusted to the upper and lower water levels. When the float presses against either stop a U-shaped tripping lever attached to the float rod engages a pivoted weight arm and carries it upward and around past the vertical position. The weight arm then falls, engages an arm on the switch drum shaft, and snaps the switch open or closed according to the direction in which the weight arm is thrown. A buffer receives the force of the weight arm's fall. When the float rod is attached to the tripping lever, as shown in cut, the pump will be started when the float presses on the lower stop and hence is properly arranged for filling reservoirs. With the rod attached to the other side of the lever, the switch is adjusted for drainage purposes, as the motor will be started when the float presses against the upper stop. The switch is of the drum type, with renewable contacts and fingers.

The float and float rod are heavily galvanized and are enameled and baked. This finish effectually prevents rust. The standard float rod permits maximum variations in levels of six feet.

These switches are made in two styles—double-pole for direct-current and single-phase alternating-current motors, and three-pole for polyphase motors. The maximum capacity is 50 amperes at 550 volts. The motor is connected directly across the line and hence can be used only with motors that do not require reduced starting voltage.

Liquid Asphalt Atomizer

J. E. WARD & Co., 781 Pacific Electric Building, Los Angeles, Cal., manufacture Ward's liquid asphalt atomizer, which is used for constructing oil

macadam, gravel or dirt highways, for top dressing and oil-sealing rock, gravel or dirt highways and for oil spraying to prevent dust.

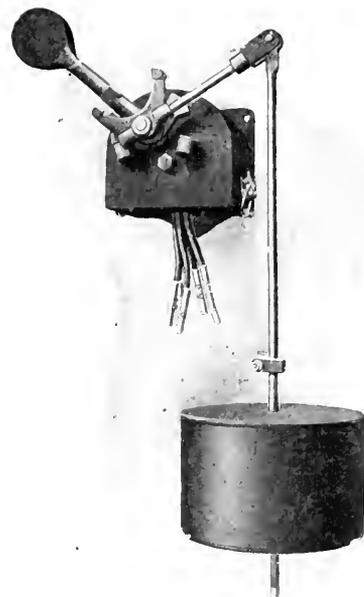

The difficulty which the machine is designed to overcome is mentioned in a recent report of the Los Angeles County Highway Commission, which reads as follows:

Our experience to date with the many gravity oiling machines in use has demonstrated the absolute necessity for uniformity in the application of oil and that this is the leading essential of good construction. It has been found that few if any of the present gravity oilers are capable of applying uniformly a quantity as low as a quarter of a gallon of oil per square yard and cover every particle of the road; also that the pressure in such oilers, being due only to the slight gravity head, is variable as the tank is emptied, which with change in temperature of oil results in considerable variation in rate of application. Frequently part of the openings will become clogged, leaving streaks in the work. It is also observed that the older oilers, having a width of only six feet, reach but a short distance beyond the wide gauge wagon being used, and unless the driving is perfect wagon wheels will lap on edge of previously oiled strip and pick up, or the second course of oil will fail to meet the first by a few inches. The slightest defect, streak or irregularity in oiling shows up after the road has been open to travel a few months and starts trouble, even though much care is given to "bucketing" and hand application to cover defects.

As a result of the past season's work, our specifications now require that all oil or liquid asphalt shall be applied with a machine which will apply the oil under pressure of not less than thirty pounds per square inch, and which is capable of perfectly coating every particle of the road with as small a quantity as one-eighth of a gallon per square yard. We also require that the oil distributor shall have a width of not less than eight feet. A temperature of 212 degrees Fahrenheit is required in applying.

The Ward machine is built in two different styles:

(1) With machinery mounted on a trailing wagon which is easily connect-

AUTOMATIC FLOAT-SWITCH

ed to any tank wagon or watering cart, and (2) with machinery mounted on the rear of a tank wagon.

The trailing rig consists of a rotary force pump operated by a gasoline engine, connected to the pump by a clutch; this allows the pump to be started or stopped at any time without shutting down the engine.

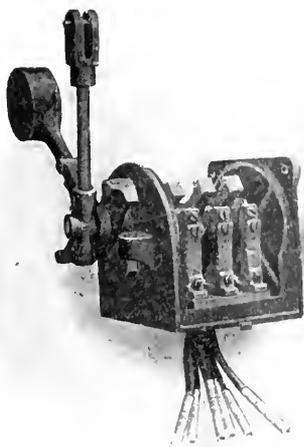

The suction pipe of the pump is connected to the tank wagon or watering cart by means of a flexible metallic hose.

The trailing wagon, on which the machinery is mounted, is provided with a short pole; this is hitched to the rear of the tank wagon, or watering cart.

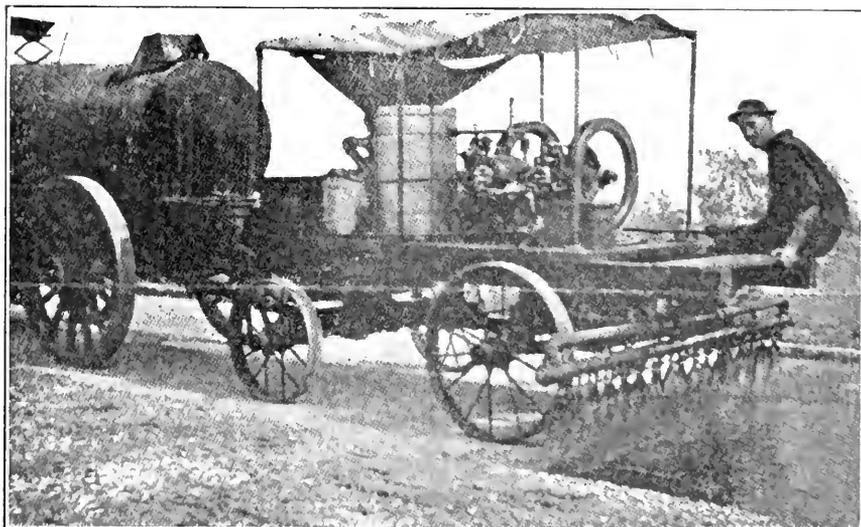

The pump draws the liquid from the tank wagon, which acts as a reservoir, and forces it through the nozzles of the distributor.

The liquid leaves the nozzles under a pressure of not less than 30 pounds per square inch, according to the amount being distributed; this is controlled by means of a by-pass between discharge pipe and suction of pump.

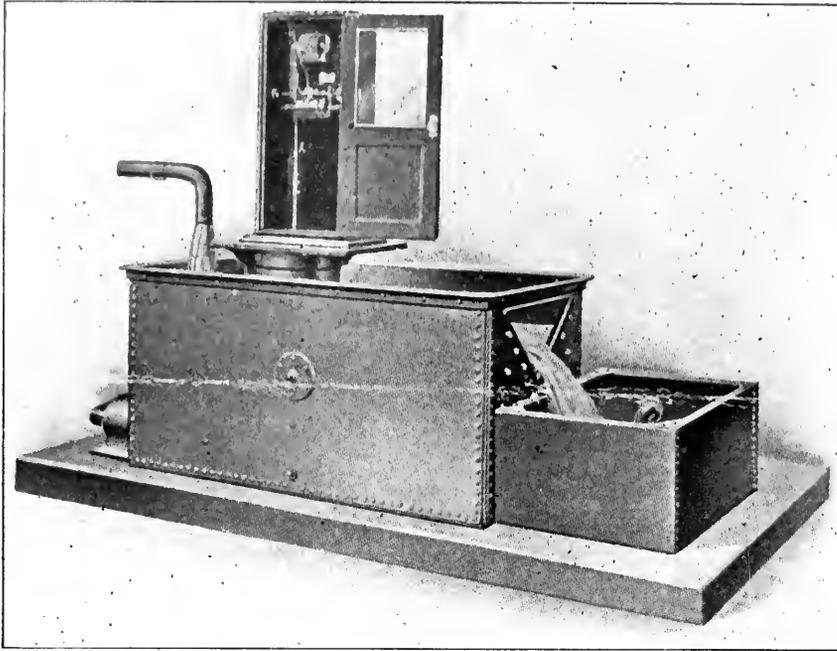

The nozzles are individually controlled; this allows a greater variation in width of surface being treated, and has proven very useful in preventing waste of material from overlapping,

INTERIOR OF SWITCH

WARD'S LIQUID ASPHALT ATOMIZER

SIMPLE DEVICE FOR MEASURING FLOW OF WATER

often caused by uneven driving, as well as the impossibility of regulating the width of distribution when the nozzles are controlled in series.

In the combination rig, shown in the illustration, the atomizing machinery is mounted on the rear of a tank wagon. This outfit is of special value where the liquid material does not have to be hauled a great distance. While light oils are used for dust laying this rig is to be preferred, or in any case where only one tank wagon is required to do the work.

The distributor is built in any width from 6 up to 10 feet, and any width of distribution can be obtained, varying by inches from two feet up to the maximum width. The distributor is easily disconnected from the discharge of the pump, so that it is out of the way when moving from one locality to another.

The quantities which the manufacturers state can be distributed vary from a minimum of $\frac{1}{8}$ gallon of heavy asphaltic oil, carrying 85 per cent of asphaltum, to a minimum of 1-12 gallon of oil carrying 60 per cent asphaltum up to a maximum of one gallon in each instance.

Outside Guided Triplex Power Pump

THE illustration of an outside guided triplex power pump is of the type supplied by W. & B. Douglas, Middletown, Conn., for the city of Norwich, Conn., under interesting circumstances. An emergency arose in connection with the Norwich water supply and additional pumping capacity was needed at once. The order was placed December 10, and on the following day a large triplex pump was shipped. Later on December 27 and January 7 two direct connected outfits were shipped as part of a permanent installation. The firm of W. & B. Douglas, by the way, are said to be the oldest pump makers in the world. For the past fifteen years, however, they have given special attention to power pumps suitable for small towns and private water works.

The pumps are made with plungers 8 inches in diameter and 10-inch stroke

(or smaller), 42 revolutions per minute, 273 gallons capacity, suction 5 inches, discharge 4 inches. The specifications for the pump follow:

Frame—Close grained iron cast in one piece with cylinders and guides making very rigid construction, and insuring constant alignment of working parts.

Crank Shaft—Open hearth steel casting of high tensile strength, accurately machined and polished on bearing surfaces.

Bearings—Crank shaft, pinion shaft and marine type pitman heads, best quality of babbitt metal, alignment secured by special jigs.

Gearing—Close grained cast iron, machine-cut from the solid—a gear guard covers the pinion and adjacent teeth of the gear. Ratio of gearing, 5 to 1; several other ratios can be furnished by special arrangement at reasonable extra charge.

Connecting Rods—Have marine type pit-

man heads. Strap head and wedge adjustment with bronze boxes at crank end furnished to order at reasonable additional charge. Bronze bushings at plunger end in all types.

Cylinders—Close grained iron, cast with housings or frame in one piece.

Plungers—Close grained cast iron, unless otherwise ordered.

Glands—Sizes up to and including 5" x 8" have screw type bronze glands, making binding impossible—larger sizes have bolted iron glands unless otherwise ordered. All are easy of access for adjustment and repacking.

Base and Valve Boxes—Close grained cast iron—large valve areas and ample, direct water ways—valves are all under front cover and easy of access.

Valves—Discs selected from proper mixture of rubber for cold water according to pressure, seating on bronze grids with cylindrically - wound phosphor bronze springs to ensure prompt closing. For hot water, bronze metal valves ground to seats unless otherwise ordered.

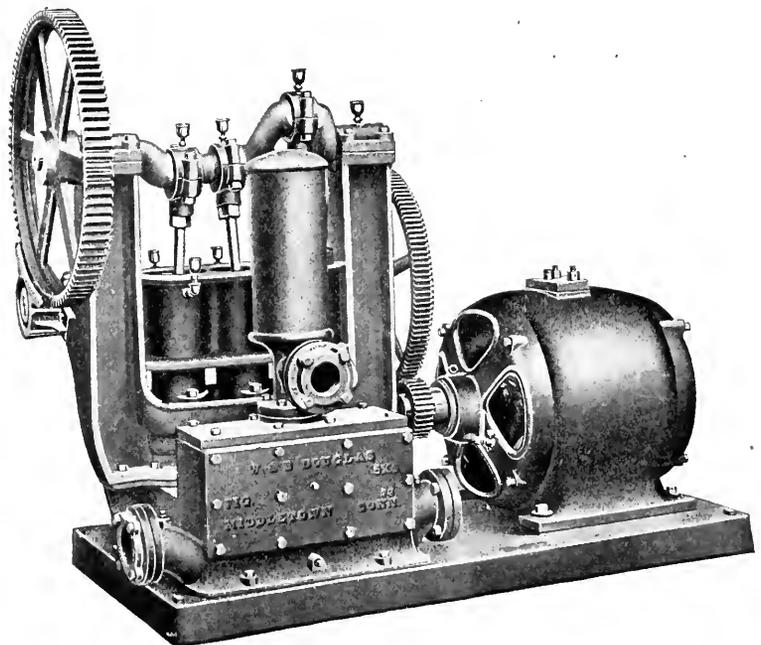

Air Chamber—Cast iron, thoroughly tested and of ample proportions—supplied with pump. Vacuum chamber to order.

Oil Cups and Wrenches—Supplied with pump; also special socket wrench to remove valve-stems and grids. Grease-cups, at same price, if preferred.

Special Construction—Phosphor bronze plungers. Bronze lined cylinders and glands. Rawhide or fiber pinion, etc., to order.

Water Flow Recorder

THE Lea water flow recorder shown in the illustration has been placed on the market by the Yarnell-Waring Company, 1109 Locust street, Philadelphia, Pa., for measuring the flow of water for boilers, from condensers, pump discharges, sewers and streams. The basis of measurement is simple because the flow from the outlet is directly proportioned to the head. The float is protected from disturbance by waves in the tank, as it is enclosed in a cylinder provided with suitable openings. The recording device is of an ordinary pattern. The recorders are said to be accurate to within $1\frac{1}{2}$ per cent by weight. The average error due to variations in temperature over a range of 50 degrees Fahrenheit does not exceed 0.5 per cent.

TRIPLEX POWER PUMP

NEWS OF THE SOCIETIES

American Society of Civil Engineers.—The forty-third annual convention of the society was held at Chattanooga, Tenn., June 13 to 16. More than one hundred members attended the meeting, a large proportion of them being from the Southern States. The first session was held in the assembly room of the Patten Hotel, where Mayor Thompson made the address of welcome. The reading of formal papers never is a conspicuous feature in the annual conventions of this society, and, as usual, the social entertainments took up most of the time not occupied by the business meetings. The Mayor mentioned the engineering work done during the Chattanooga campaign of the Civil War. As indicating one advance in engineering he said he supposed no engineer present would follow the plans of General Grant, who during the Peninsular campaign threw up the dirt on the inner side of the trenches. President Endicott in his annual address gave a brief historical sketch of the society. He mentioned the development of Chattanooga since the society met there twenty years ago. He alluded to the march of progress during the century and believed that there was never a step taken that an engineer was not in the van. "One of the definitions of civil engineering," said he, "is 'the construction of works of public utility,' and you will see that this definition applies fairly well to all branches of engineering. I like it better than I do some of those more labored which have been proposed from time to time, and you know there have been many fruitless efforts to find one that is short, comprehensive and correct. It expresses the result, for everything that the engineer does is directly or indirectly the production of works for the convenience, wealth, comfort, health, safety or happiness of mankind. If he destroys anything it is only that something better for the public may be constructed or established in its place. What a privilege, what an opportunity, is presented in these days for taking part in the accompaniment of these great public utilities."

The afternoon was spent on Lookout Mountain. There was a basket dinner prepared by the ladies of the local entertainment committee, served at the base of the New York monument. In the evening George E. Rowell, assistant engineer in charge of the work, gave an illustrated lecture on the lock and dam of the Chattanooga and Tennessee River Power Company.

Thursday, the second day of the convention, was taken up with an all-day excursion to the locks and dam at Hale's Bar in the Tennessee River, which furnished the subject of the lecture on the evening before. A special train left the Union Station early in the morning with about one hundred members of the society and about forty ladies. Colonel Bogard, chief engineer, was assisted in caring for the party by E. C. Lewis, chairman of the board of directors, and Chief Engineer Hunter McDonald, of the Nashville, Chattanooga & St. Louis Railway. After reaching Hale's Bar two steamboats were used in transporting the party to the west side of the river. The locks, which have recently been finished, were first inspected. About one-third of the dam has been finished, and this proved very interesting to the engineers as well as the large centrifugal pumps.

The power house was visited while the last roof truss was put in place. Altogether, nearly 1,800 men were at work in the construction. The contracting firm, Jacobs & Daines, served a lunch to the guests. In the evening there was a reception and dance in the Hotel Patten.

On Friday, the last day of the convention, the members divided into several parties. Some visited the Dixie Cement Works, Richard City, Tenn. More than fifty visited the Chattanooga water works. L. H. Bixby, resident manager of the company, was in charge of the party. After inspecting the plant a picnic was served in the grove. After luncheon a golf tournament was held at the Chattanooga Golf and Country Club.

North Carolina Good Roads Association.—The annual meeting was held at Winston-Salem June 15. The following officers were elected: H. B. Varner, president; Dr. J. H. Pratt, secretary; J. G. Brown, treasurer. As vice-presidents one member from each Congressional District was elected as follows: R. R. Cotten, of Bruce; J. L. Patterson, of Roanoke Rapids; R. L. May, of Trenton; M. C. Winston, of Trenton; P. H. Hanes, of Winston-Salem; E. MacEartham, of Wilmington; Leonard Tufts, of Pinehurst; P. B. Beard, of Salisbury; F. M. Shannohouse, of Charlotte, and E. C. Chambers, of Asheville.

C. H. Moorefield, United States Office of Public Roads, read a paper on "Sand-Clay Roads," which he recommended on account of low cost of construction and maintenance as well as their good qualities as roadways. He advised the construction of sand-clay roads in preference to macadam wherever the soil would admit of it. A. D. Batchelder, representing the American Organization of Automobileists, said that the organization of a State automobile association would do more to promote good road building than anything else. A paper by P. D. Gold, Jr., Raleigh, on "State Security for County Bonds" was read and ordered printed.

The opening of a question box and the discussion over the problems propounded was a feature of interest. It was the general sense of the assembly that State convicts should be taken off the farms and placed on the public roads; that each county requires a road engineer; that Beaufort, with its soil, should build sand-clay and not macadam roads.

Much of the practical work of the meeting was expressed in a series of resolutions, among which were the following: That Federal aid in road building be favored; that convicts be not leased to corporations, but employed on county roads; that the State should appropriate \$1,000,000 annually for roads; that those interested in the construction of highways make tours of inspection at such intervals as the promoters of each highway consider advisable; that county good roads associations be formed; that the Legislature be asked to establish a State Board of Trade.

A tour of inspection of the roads of Forsyth County was made and the members of the association witnessed a demonstration of Tarvia by the Barrett Company under the direction of its representative, Mr. Devine. The demonstration was made on about 75 feet of the road in front of Piedmont Park.

South Carolina Water Works Association.—The following program for the first annual convention to be held at Columbia, June 28-29, has been issued:

Wednesday, June 28, 3 P. M.

Call to order and introductory remarks, W. F. Stieglitz, Council Superintendent Columbia Water Works.

Address of welcome, Hon. W. H. Gibbs, Mayor of Columbia.

Response, Hon. Kenneth Baker, Mayor of Greenwood.

Election of temporary chairman.

Appointment of Committee on Organization.

Enrolling membership, active and associate.

Discussion on Advantages and Benefits of a Tri-State Organization, by Superintendent Figg of Savannah, Neave of Salisbury, McLure of Anderson, Ferguson of Augusta, Moffett of Charlotte, Barnwell of Yorkville, Barrow of Athens, Jones of Fayetteville, Easterling of Union.

Election of officers for the ensuing term.

Address on Relation of Water Supply to the Public Health and the Danger in the Use of Well Water, Dr. Wm. A. Boyd, Health Officer, Columbia.

General discussion, resolutions, etc.

Adjourn at 5.30 p. m. for refreshments at Irwin's Park and display of the Columbia Water Works.

8.30 P. M.—Address on Columbia's Water Supply, Past, Present and Future, Dr. J. W. Babcock, Superintendent State Hospital for the Insane.

Address on Relation of the Local Organization to the National Association, J. M. Diven, secretary American Water Works Association.

General discussion.

Thursday, June 29, 9.30 A. M.

Address on Ozone Treatment of Water, R. S. Mebane, president Republic Cotton Mills, Great Falls, S. C.

Short talks by representatives of water works supply houses and manufacturers.

Selection of next place of meeting.

New business and adjournment.

Information.

Firemen's tournament will be in progress during our meeting.

Hand reel and horse hose wagon races will be run on 28th and 29th.

A display of automobile fire apparatus will be made by the Columbia Fire Department.

Columbia's crack baseball team will battle with Charleston on 28th and 29th.

The arrangements for the entertainment of the visitors contemplate, in addition to the trip to Coney, automobile rides for the women members of the party Wednesday afternoon through the county parks and Friday morning to the suburbs. There will also be a theater party Wednesday night.

Society of Engineers of Rensselaer Polytechnic Institute.—The following officers have been elected: President, W. W. Rousseau, '05, Troy; vice-president, J. I. Shankley, '72, Haverstraw, N. Y.; treasurer, Frederick A. Burger, '13, Welland, Ontario; corresponding secretary, James A. Ryan, '13, New York; recording secretary, Wallace S. Shutz, '14, Marshall, Minnesota; librarian, Paul M. Kuder, '14, Seigfried, Pa.; trustees, J. A. Powers, '80, Troy; Virgil H. Heines, '81, New York; Ralph H. Chambers, '93, New York; Arnold H. Stutermeister, '94, Albany; Thomas H. Harvey, '98, Long Island City.

Rochester Engineering Society.—The annual meeting and election of officers of the society took place June 9 at Reynolds Library. The reports of officers were read, showing the society to be in a flourishing condition. The report of the secretary-treasurer showed an increase of 22 members in the past year and \$1,102.91 in the treasury. The society has now 236 members.

The result of the election was as follows: President, H. V. Norwood of the Taylor Insurance Company; first vice-president, H. W. Peck, Rochester Railway & Light Company; second vice-president, D. P. Falconer, New York State Railways; secretary-treasurer, Edward F. Davison, Rochester Electric Motor Company.

Mayors' Club of Massachusetts.—The annual meeting was held in Holyoke, June 12-13, the first meeting ever held outside of Boston. Trolley cars were provided and the guests, numbering about 40, were taken to Mt. Tom, where a banquet was given at 4 p. m., after a brief business session. Each guest was given an attractive souvenir program and menu. The book contained pictures of the first mayors' club of Massachusetts, the City Hall, Summit House on Mt. Tom, public library, State armory, post office, City Hospital, views of the Connecticut River, canals and the Holyoke dam. After the banquet a visit was made to Brightside. The second day was given to visiting points of interest in and about the city, including factories and municipal plants. An automobile sightseeing tour was made. In the afternoon the party attended the theatre. Each of the ladies attending the gathering was given a box containing samples of Holyoke products, stationery, silk goods, etc. The only formal address during the meeting was that of Rev. Dr. John S. Lyon, who described the great growth of cities as compared with country districts. He challenged the statement that the greatest problems in democratic government are in the cities.

Commission Government Mayors of Illinois.—Mayors of fifteen Illinois cities now ruled under the commission form of government met in the National Hotel at Peoria recently for the purpose of forming a permanent organization by which they hope to solve the present commission form of government law in a uniform manner, thereby preventing a difference in interpretation of its various clauses in different cities. The meeting was called to order by Mayor Martin R. Carlson, of Moline, who originated the idea of a permanent organization, and the Mayors of the following cities were present: Braceville, Carbondale, Decatur, Dixon, Elgin, Hillsboro, Jacksonville, Kewanee, Pekin, Rock Island, Springfield, Spring Valley, Wankegan, Rochelle and Moline.

Louisiana State Firemen's Association.—At the convention, Covington, La., May 27, the following officers were elected: J. T. Heaney, New Orleans, president, by a majority of 28 votes over R. B. Stone, Gretna; William Holmes, of Bogalusa, vice-president; William Kleinpeter, Gretna, secretary; Sidney Brown, Opelousas, treasurer, and J. C. Gibbs, Winnfield, statistician; Jacob Feller, Covington; S. Mouton, Lafayette, delegates to National Association; Chris O'Brien, of Shreveport, delegate to the International Association of Fire Engineers. Plaquemine secured the 1912 convention.

Society for the Promotion of Engineering Education.—The Tuesday and Wednesday sessions of the Pittsburg meeting, June 27-29, will be held at the School of Applied Science of the Carnegie Technical Schools. Thursday's sessions will be held at Thaw Hall of the University of Pittsburg. The papers to be presented are announced as follows: "Teaching English in Technical Schools," Prof. S. C. Earle, Tufts College; "The Preparation of Written Papers in Engineering Schools," Prof. F. N. Raymond, University of Kansas; "The Use of Logarithmic Diagrams in Laboratory Work," H. A. Gehring, Department of New York State Engineer; "Highway Engineering," Prof. H. H. Blanchard, Brown University; "Balance of Courses in Chemical Engineering," Dean C. H. Benjamin, Purdue University; "Chemical Education for the Industries," Prof. J. H. James, Carnegie Technical Schools; "All-Year Sessions, Individual Instruction: Renewed Suggestions," Dean W. G. Raymond, University of Iowa; "The Architecture of Engineering Schools," Prof. J. M. White, University of Illinois; "The Wentworth Institute," A. L. Williston, Director Wentworth Institute; "An Engineering Course for Underclassmen," Profs. W. A. Hillebrand and S. B. Charters, Jr., Stanford University; "Electrical Engineering Instruction," Prof. E. B. Paine, University of Illinois; "Teaching of Scientific Shop Management, with Use of Engineering School Shops as the Laboratory," Profs. H. Wade Hibbard and H. S. Philbrick, University of Missouri; "Technical Training from the Business Man's Standpoint," E. B. Raymond, vice-president Pittsburgh Plate Glass Company; "Adapting Technical Graduates to the Industries," C. F. Scott and C. R. Dooley, Westinghouse Electric and Manufacturing Company; "Co-operative System of Engineering Education at the University of Pittsburg," Dean F. L. Bishop, University of Pittsburg. Committee reports: "Teaching Mathematics to Engineering Students," Prof. E. V. Huntington, Harvard University; "Entrance Requirements," Prof. J. J. Flather, University of Minnesota, chairman. Presidential address on "The Engineering Teacher and His Preparation," A. N. Talbot.

Calendar of Meetings

- June 27-29, **Northwestern Indiana Volunteer Firemen's Association.**—Annual Convention, Winchester, Ind.—Chief Guy Way, Winchester, Ind.
- June 27-July 1, **American Society for Testing Materials.**—Fourteenth Annual Meeting, Hotel Traymore, Atlantic City, N. J.—Edgar Marburg, Secretary, University of Pennsylvania, Philadelphia, Pa.
- June 28-29, **South Carolina Water Works Association.**—Meeting for Organization, Columbia, S. C.—W. F. Steiglitz, Temporary Secretary, Columbia, S. C.
- June 28-30, **International Association for the Prevention of Smoke.**—Annual Convention, Newark, N. J.—R. C. Harris, Secretary, City Hall, Toronto, Ont.
- July 3-8, **South Dakota State Firemen's Association.**—Tournament and Convention, Lead, S. D.—Charles P. Coolidge, Lead, S. D.
- July 21-23, **Wisconsin State Firemen's Association.**—Annual Convention, Fort Atkinson, Wis.
- July 25-26, **Western New York Firemen's Association.**—Convention, Springville, N. Y.
- July 25-28, **Iowa Firemen's State Association.**—Tournament, Des Moines, Ia.—N. J. Francis, Secretary, Des Moines.
- July 25-28, **American Acetylene Association.**—Annual Convention, Atlantic City, N. J.

PERSONALS

BARCLAY, W. F., who has been Superintendent of Parks of Wilkes-Barre, Pa., for the past five years, has tendered his resignation.

CHAPMAN, P. P., has been elected Mayor of Manassas, Va.

EGAN, CHARLES, has been appointed Deputy City Treasurer of Oklahoma City, succeeding C. L. Butler, resigned.

GERHART, LOUIS, Mayor of Terre Haute, Ind., is making an extended Eastern automobile trip to get ideas and approve final specifications for a 1912 automobile fire and police apparatus. The trip will include visits to Boston, New York, Atlantic City, Harrisburg and Pittsburg, and is in the nature of a machine test, as Terre Haute proposes to supplant horses with motor cars in the city Police and Fire Departments before the expiration of three years.

FARNHAM, FREDERICK W., ex-Mayor of Louisville, Ky., has been appointed Assistant Engineer in the office of the City Engineer.

FISHER, E. A., City Engineer of Rochester, N. Y., delivered a lecture last week on "The Care and Paving of Streets" before the Board of Trade of Williamsport, Pa.

FOSTER, SAMUEL D., of Pittsburg, has been appointed Chief Engineer of the State Highway Department. Under the new road law the Chief Engineer must be a competent civil engineer and experienced in the building and maintenance of improved roads. Mr. Foster is now the Road Engineer of Allegheny County, a position he has held since 1909. He has had much experience in road building, and, it is said, was recommended by Highway Commissioner Bigelow. He is a graduate of Washington and Jefferson College.

MARKER, JAMES R., of Celina, Ohio, has been appointed Highway Commissioner by the Governor. Mr. Marker has been Chief Engineer of the Board of Public Works. He takes the place of James C. Wonders.

NISSLEY, J. E., is the new Mayor of Guthrie, Okla.

OLVANY, GEORGE W., an attorney-at-law, has been appointed Deputy Fire Commissioner for the boroughs of Manhattan, the Bronx and Richmond.

ROHDE, JACOB, has been appointed Chief of the Fire Department of Atlantic Highlands, N. J.

SCHERER, BENJAMIN J., of Milwaukee, has been appointed a member of the fire and police commission for four years to succeed Michael Carpenter.

SHEPPERD, W. H., has been elected mayor of South Boston, Va.

SHIELD, E. SOUTHARD, is the new mayor of Lexington, Va.

STETSON, FRANK L., a prominent lumber manufacturer and for thirteen years chief of the fire department of Minneapolis, has been appointed chief of the Seattle fire department to succeed John Boyle, resigned.

VAN LAKE, CHARLES, former sanitary officer for the city health department of South Bend, Ind., has been promoted to the office of city food inspector to succeed John T. Willett, resigned to become a state food inspector.

WEGNER, ERNEST, has been appointed Chief of Police of Galveston, Tex.

WHEELER, PROF. E., has been appointed Mayor of Montesano, Wash., to succeed Mr. Durdle, resigned.

WREN, G. J., has been elected Mayor of Modesto, Cal.

INDUSTRIAL NEWS

Cast Iron Pipe.—Chicago: Market is quiet. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: Quite a number of inquiries for large lots of water pipe have been received, mostly from the Coast and Central West, all of which will, it is thought, result in new business. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, \$21. New York: Very few public lettings are coming out, and the demand from private buyers has again subsided to small proportions. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—While the demand for lead is not heavy the market has an upward trend and outside sellers are now demanding the price that the syndicate has held to since early in the year, which is 4.50c New York and 4.35c St. Louis.

Pumping Engine.—The Finance Committee of the Atlanta (Ga.) City Council has decided to recommend the acceptance of the proposition made by the Holly Manufacturing Company, of Buffalo, N. Y., which is to furnish two new cylinders for the water works pump at the river station at a cost of \$4,400. The city had entered suit against the company for \$8,500 on the ground that the two cylinders were defective, which caused them to crack. But the company contends that the city forced the pump to do extra duty above what the specifications required.

High-Pressure Pumps.—According to the New York Dept. of Water Supply, overdraft on the pumps was responsible for the water shortage during the Dreamland fire. In response to a request from W. E. Dickey, vice-president of the Goulds Manufacturing Company, Seneca Falls, N. Y., which supplied the pumps for the high-pressure fire service at Coney Island, Deputy Water Commissioner J. W. F. Bennett has written him a letter to this effect: "Mr. Dickey told the Department of Water Supply that the reputation of his firm had been damaged because, just after the Dreamland fire Fire Chief Lally gave out an interview criticising the high-pressure service. In answer, Deputy Commissioner Bennett said: 'The three high-pressure fire service gas-engine-driven pumps at the Coney Island station worked satisfactorily during the Dreamland fire. The overdraft on the pumps necessarily resulted in the reduction in pressure shown on the charts.'"

Motor Steam Fire Engine.—The Nott Fire Engine Company, Minneapolis, Minn., are constructing for the city of Bridgeport, Conn., a gasoline-propelled steam fire engine like that put in commission in New York City a few months ago. The engine will be delivered some time during the summer and will answer all alarms.

Industrial Development of City.—President C. A. Adams of the Cleveland Chamber of Commerce, Cleveland, Ohio, has appointed a new committee on industrial development, which will gather data regarding the industries of the city and determine new industries that are needed. The work of the committee in the past year brought some new manufacturing plants to the city. D. T. Croxon, president of the Cleveland Furnace Company, was reappointed chairman of the committee.

Spiral Riveted Steel Pipe.—The American Spiral Pipe Works, Chicago, Ill., have recently made some important extensions to their line of manufacture, and have greatly increased their facilities and have established one of the largest and most complete lines of piping in the country. In connection with their 3-inch to 42-inch spiral riveted pipe, they are now in position to furnish lap welded pipe from 12 inches to 72 inches in diameter up to 1¼ inches in thickness, and a number of types of forged steel connections have been added to meet each particular requirement.

Water Works Supplies.—It is said that the H. Mueller Manufacturing Company, Decatur, Ill., is contemplating the establishment of a Canadian branch factory at Port Arthur, Ont., for making plumbers' brass goods and water works brass fixtures.

Steel Manufactures.—The Carnegie Steel Company on July 1 will take possession of the warehouse and stock of the Bassett-Presley Company, Cleveland, Ohio, and will conduct a general jobbing business from that city. For the past few months the Carnegie Company has been doing some jobbing business in the Cleveland territory, making deliveries from its Pittsburg warehouse. The Bassett-Presley warehouse will be enlarged considerably, the Carnegie Company having acquired adjoining property for that purpose, as more room is needed for structural material, which the Bassett-Presley Company did not carry in stock. The warehouse stock of the Carnegie Company will include bars, plates, shapes, sheets and possibly other products. The Bassett-Presley Company will retain its name and will probably continue in business along other lines, although its plans have not yet been decided upon.

Reinforced Concrete Pipes.—Parmly & Wethercut, successors to Walter C. Parmly, Everett Building, New York, have issued a pamphlet describing and illustrating their system of reinforced concrete sewers, conduits, manholes and tunnels. They are built of concrete segments or blocks, hardened before laying. They are reinforced in rabbeted form of joints as they are built in place in trench. Reinforcement is also embedded in the blocks.

Announcement.—On June 1, 1911, the Fort Wayne Electric Works will be merged with the General Electric Company of Schenectady, N. Y. Its business will be conducted under the name of Fort Wayne Electric Works of General Electric Company. The same lines of apparatus and supplies will continue to be manufactured and sold under the immediate direction of the same individuals as heretofore, with Mr. F. S. Hunting in responsible charge as general manager. All correspondence should be sent to the Fort Wayne Electric Works at the same addresses as in the past. Bills and statements will be rendered from Fort Wayne, Ind., and all remittances should be made to Fort Wayne Electric Works, Fort Wayne, Ind. All outstanding contracts and other obligations of the Fort Wayne Electric Works will be carried out by the new organization. The offices of the Fort Wayne Electric Works of General Electric Company will be continued as heretofore.

Testing Cement.—The Universal Portland Cement Company, Chicago, Ill., has published in pamphlet form the standard specifications and uniform methods of testing and analysis for Portland cement, embracing the report of the committee on standard specifications for cement of the American Society for Testing Materials; the report of the committee on uniform tests of cement of the American Society of Civil Engineers, and the report of the committee on uniformity in technical analysis for limestones, raw mixtures and Portland cements of the Society for Chemical Industry, New York Section.

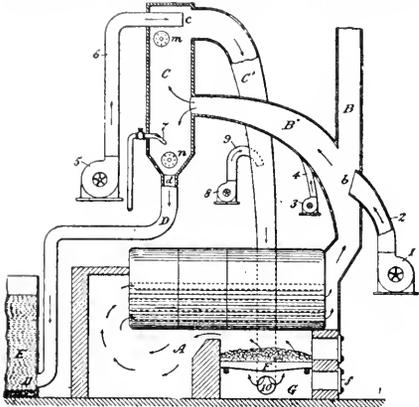

Empty Cement Sacks.—It is reported that the railroads west of Chicago will put in effect a new rule obliging railroad agents to refuse to accept a shipment of empty cement sacks unless they are properly bundled and tagged. East of Chicago this ruling has been in effect some time. West of Chicago, however, it has been the custom to charge double rates for poorly bundled shipments. The rules governing shipments are as follows: Each bundle of sacks shall be securely tied with not less than three separate wire ties, or three separate ties of rope, the latter to be at least 3-16 of an inch thick. Each bundle shall be marked with a linen tag showing the name and address of shipper and consignee, the tag to be securely fastened to the bundle by wire. Freight must be completely prepaid.

Consulting Engineers.—George W. Fuller, hydraulic and sanitary engineer, announces that he has associated with him as partners James W. Armstrong, James C. Harding and James R. McClintock, all of whom were formerly on the staff of Hering & Fuller. Mr. Armstrong had more than a dozen years' experience in general engineering practice, especially in railroad and structural iron work, and then for ten years he was on the staff of George G. Earl, General Superintendent Sewerage and Water Board, New Orleans, La., first in charge of the design of nine sewage pumping stations and later in the immediate charge of the design and construction of the New Orleans water purification plants and appurtenances. Recently he has had immediate charge for Hering & Fuller of the design of water purification plants for Grand Rapids, Mich.; Minneapolis, Minn., and Montreal, Province of Quebec. Mr. Harding spent some five years as assistant to Ernest Bowdich, and then for ten years was Assistant City Engineer of Pittsfield, Mass., in charge of the construction and operation of the sewerage system, sewage pumping station and sewage disposal works. Since 1907 he has been with Hering & Fuller, principally on sewerage work, and has had immediate charge of the design of sewerage and sewage purification works for a number of cities, and of investigations of typhoid fever epidemics. Mr. McClintock has been for the past five years with Hering & Fuller, partly on designing and partly on outside work, particularly with reference to water works appraisements and the construction of water filters. He was resident engineer on the water filtration plant of Burlington, Vt., and at present is in charge of extensive improvements to the water works and sewerage systems of Clarksburg, W. Va. The offices of Mr. Fuller and his associates will be at 170 Broadway, New York City.

PATENT CLAIMS

995,765. SMOKE-CONSUMING FURNACE. Bernard F. Brady, New York, N. Y. Serial No. 578,279.

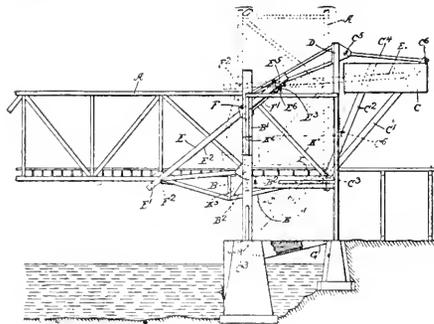

In combination with a furnace having an ash-pit and grate bars, smoke-flue B, eduction pipe 2 provided with projection b communicating with said smoke-flue B, separating-tank C, smoke-flue B' connecting said smoke-flue B with said separating-tank C, eduction pipe 4 communicating with said smoke-flue B', eduction pipe 6 provided with projection c, communicating with said separating-tank C, water jet 7 communicating with said separating-tank C, water-tank E, pipe D leading from said separating-tank C to said water-tank E, passage C' leading from said separating-tank C to the ash-pit below the grate bars,

eduction pipe 9 communicating with said passage C', said eduction pipes 2 and 4 being in communication with means for forcing the smoke and heavy unconsumed products of combustion through said smoke-flue B' into said separating-tank C, said eduction pipes 6 and 9 being in communication with means for forcing the smoke proper from said separating-tank C through said passage C' respectively into said ash-pit below said grate bars, and said water jet 7 being in communication with water supply for the purpose of forcing the heavy unconsumed products of combustion from said separating-tank C through said pipe D into said water-tank E, substantially as described.

995,813. BRIDGE. Joseph B. Strauss, Chicago, Ill., assignor to The Strauss Bascule and Concrete Bridge Company, Chicago, Ill., a Corporation of Illinois. Serial No. 292,208.

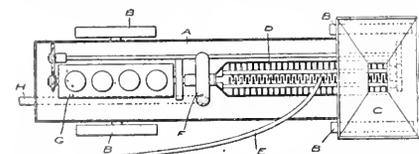

A bridge comprising a movable section, a counterweight therefore, a supporting device for the counterweight extending upwardly above the roadway, a pivotal con-

nection with the arc shaped recess in the disk, and adapted when within said recess to hold the retracting spring under tension, and time mechanism for actuating said rotatable device.

995,446. METHOD OF SNOW DISPOSAL. Cadwallader Evans, Jr., Pittsburg, Pa. Serial No. 615,557.

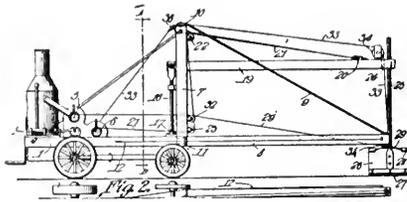

The method of removing snow from city streets comprising the following steps: 1st,

gathering the snow; 2nd, agitating the same; 3rd, forcing the agitated mixture to a distant point.

992,359. TRENCH-FILLING MACHINE. Carlos A. Kenney, Hammond, Ind. Serial No. 555,692.

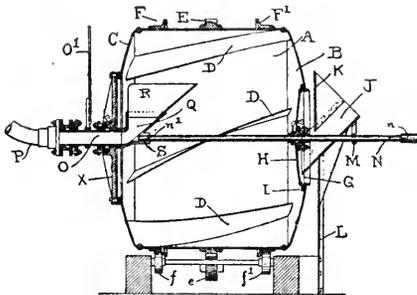

A machine of the class described including a portable structure, a scraping blade carried thereby, means for adjusting the

blade vertically, adjustable side members and means connected to said members for shifting the blade laterally therebetween.

995,422. APPARATUS FOR MIXING AND DELIVERING CONCRETE AND THE LIKE MATERIALS. St. John Clarke, Bogota, N. J., and Rudolph Welcker, Yonkers, N. Y. Serial No. 599,231.

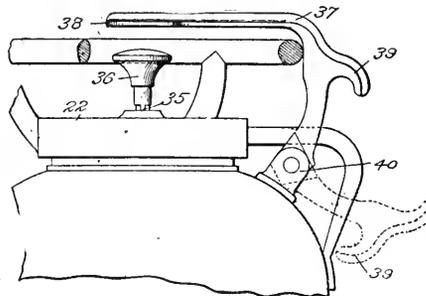

In an apparatus for handling concrete and the like materials, the combination of a closed mixer casing having a discharge port, with a hopper within and inclosed by

the mixer casing, and having its discharge end communicating with said port, and means for injecting a stream of air directly into the outlet of said hopper and directing said air toward the discharge port, said casing having means for feeding concrete toward the hopper.

995,833. FIRE-EXTINGUISHER APPARATUS. Harry M. McCaslin, Elmira, N. Y., assignor to American-L. France Fire Engine Company, Elmira, N. Y., a Corporation of New York. Serial No. 499,807.

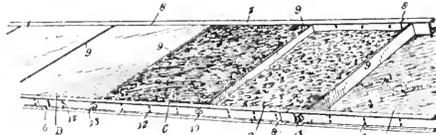

In a fire extinguisher, the combination with the operating member; of a guard member therefor movable into and out of

protecting position and having a hanger portion by which the extinguisher may be hung upon a suitable support to thereby maintain the guard member in protecting position.

995,620. KNOCKDOWN METAL FORM FOR CONCRETE SIDEWALKS. Harry M. Naugle, Canton, Ohio, assignor to The Berger Manufacturing Company, Canton, Ohio, a Corporation of Ohio. Serial No. 562,464.

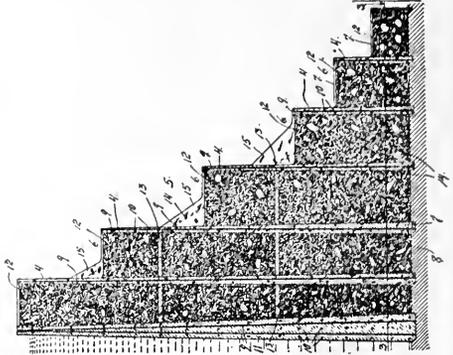

In a device of the character described a side piece and a division plate adapted to be locked to each other by a wedge, and a spring wedge for connecting said piece

and plate, said wedge formed of a plate of metal bent upon itself with its sides spaced from each other adjacent the bend and the free ends lying close together to form the thin end of the wedge.

994,666. DAM CONSTRUCTION. George J. Bancroft, Denver, Colo. Serial No. 571,562.

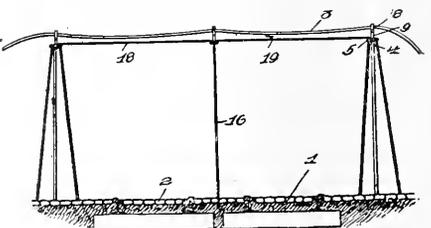

A dam consisting of a number or rows of cells or chambers, the walls of which are thickest at the base of the dam and

gradually decreasing in size toward the top, and a suitable filling contained within the said cells or chambers to form a solid mass of the dam, substantially as described.

995,940. HOSE-BRIDGE. John J. Armstrong, Pittsburg, Pa. Serial No. 583,409.

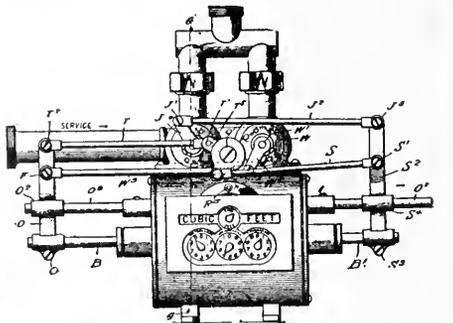

A hose bridge comprising a pair of outer supporting members, each of said members being provided with a head, a pair of legs supporting the head of the intermediate member, a series of legs supporting the heads of each of the outer members, each of said outer members further comprising a vertically-disposed yoke having a relatively long shank depending centrally therefrom and formed with a reduced end extending through the head of said member; means

engaging the reduced end of for securing the yoke to the head, each of said yokes having the inner face of each of its arms cut-away to provide a recess, a vertically-disposed removable bearing mounted in each of said recesses, a bearing roller having reduced ends journaled in said bearings and positioned above the bottom of the yoke, and means for pivotally connecting the legs to the head, and tie members having angle-shaped ends depending in the heads for supporting and connecting the supporting members together.

995,278. WATER AND GAS METER. James J. Mulhall, Albany, N. Y. Serial No. 583,478.

A gas and water meter comprising a cylinder with apertures in the ends thereof and having a plurality of compartments, a piston in each compartment having a stem movable through the aperture in the respective end of the cylinder, valve casings each having ports communicating with the respective compartment of the cylinder, a

discharge pipe communicating with said casings, a cut off valve in each casing, a meter register, a crank arm fixed to each cut off valve, a guide bar fixed to each piston stem and connections between said guide bars and crank arms, a rotatable register operating mechanism, pivotal rods connecting the latter and said guide bars, as set forth.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Ohio	Cincinnati	June 30, noon	Treating with tar Hillside ave. and Warsaw pike; oiling Springfield pike in Springfield township.	Stanley Struble, Pres. Bd. Co. Comrs.
Arkansas	Little Rock	June 30	Paving about 13,000 sq. yds. with creosoted block; 25,000 sq. yds. of macadam.	E. A. Kingsley, Engineer.
Arkansas	Argenta	June 30	Constr. about 30,000 sq. yds. creosated block pavement; 25,000 sq. yds. macadam.	Mayor Faucette.
Ohio	E. Liverpool	June 30	Improving various streets. Estimated cost \$30,600.	C. V. Beatty, Dir. Pub. Service.
Kentucky	Middlesboro	July 1	Constr. sidewalks, curb. and guttering in various streets.	E. S. Helburn, Mayor.
Georgia	Rome	July 1, noon	Grading, curbing and paving various streets with wood block vit. brick, Hassam, asphalt macadam, sheet asphalt and bitu.	J. R. Cantrell, City Clerk.
Indiana	Greencastle	July 1	Constr. about 40,000 ft. of macadam road in Putnam County.	D. V. Moffett, County Auditor.
Vermont	Middlebury	July 1, 3 p.m.	Constructing 2,000 sq. yds. macadam roadway.	Jos. M. Burke, Clerk.
Virginia	Richmond	July 1, noon	Constructing about 7½ miles gravel road.	P. St. J. Wilson, St. Hwy. Comr.
Ohio	Delaware	July 1	Improving Taylor Corporation Road 3.696 miles; and Link State Road 4.68 miles.	W. F. Whittier, County Surveyor.
Tennessee	Rutledge	July 1, 10 a.m.	Grading 16½ miles county highway.	A. M. Nance, Secy. Road Comn.
New York	Johnstown	July 3, 7:30 p.m.	Constr. about 2,946 sq. yds. asphalt block pav't; 1,244 lin. ft. curb reset, 30 lin. ft. new curb and appurtenances.	Grover E. Yerdon, City Clerk.
Pennsylvania	Northumberland	July 3, 8 p.m.	Constr. about 3,102 sq. yds. vit. brick pav't; 1,275 lin. ft. stone curb, 1,200 cu. yds. excavation.	Chas. H. Dodge, Clerk Council.
Indiana	Portland	July 3, 10 a.m.	Improving highway in Bearcreek township.	W. Lea Smith, County Auditor.
Indiana	Vernon	July 3, 11 a.m.	Constructing 3 mile pike road in Bigger township.	M. W. Brogan, County Auditor.
Indiana	Williamsport	July 3, 3 p.m.	Constructing highway in Mound township.	D. H. Moffitt, County Auditor.
Indiana	Newport	July 3, 10 a.m.	Constructing gravel road in line Helt and Clinton townships.	H. T. Payne, County Auditor.
Indiana	Franklin	July 3, 1 p.m.	Constructing a gravel in Union township.	W. B. Jennings, County Auditor.
Indiana	Versailles	July 3, 1 p.m.	Constr. macadam roads in Laughrey and Otter Creek townships.	Nicholas Volz, County Auditor.
Indiana	Salem	July 3, 1:30 p.m.	Constructing a road in Brown township.	F. S. Munkel, County Auditor.
Indiana	LaPorte	July 3, 10 a.m.	Constr. macadamized roads in Scipio and Cass townships.	F. A. Hausheer, County Auditor.
Indiana	Greenfield	July 3, 10 a.m.	Constr. of grades in Sugar Creek and other townships.	C. H. Troy, County Auditor.
Iowa	Corning	July 3, 7:30 p.m.	Grading, paving, curbing and guttering various streets, consisting of about 12,000 sq. yds. vit. brick paving; 2,373 lin. ft. combined concrete curb and gutter; 1,857 gutter; 2,650 yds. grading.	Wm. C. Chubb, City Clerk.
New Jersey	Westfield	July 3, 8:15 p.m.	Constr. about 3,200 sq. yds. bituminous macadam pavement, concrete culverts, drains and appurtenances; 1,000 cu. yds. ex.	Chas. Clark, Town Clerk.
West Virginia	Parkersburg	July 3	Paving with brick portions of 4 roads in Wood County.	C. S. Skidmore, County Engineer.
New York	Olean	July 5, 8 p.m.	Constr. about 9,800 sq. yds. of wire-cut-lug block pavement; 6,000 lin. ft. stone curbing.	John H. Gaynor, Engineer.
Florida	Tampa	July 5, 2 p.m.	Resurfacing about 1½ mile road in Hillsboro County with shell or its equivalent.	Bd. County Comrs.
Indiana	Vincennes	July 5, 2 p.m.	Constr. about 93,400 ft. of gravel roads in Knox County.	John T. Scott, County Auditor.
New Jersey	Jersey City	July 5	Paving the Plank road.	Bd. Freeh., Hudson County.
Pennsylvania	Jermyn	July 5, 7:30 p.m.	Constr. about 11,000 lin. ft. concrete curb, one half to be protected with steel bar.	John A. Loughney, Secy. Town C'cil.
Ohio	Cleveland Hghts.	July 5, noon	Grading, draining, sewerage, paving with macadam and constructing sidewalks in portion of Euclid blvd.	H. M. Canfield, Village Clerk.
Indiana	Fountain City	July 5, 1:30 p.m.	Constructing highway in Fulton township.	W. B. Gray, County Auditor.
Pennsylvania	Pittsburg	July 5, 10 a.m.	Constr. about 10 miles in Allegheny County.	R. J. Cunningham, County Compt. City Clerk.
Ohio	Youngstown	July 5	Paving various streets.	Joint Com. Co. Essex and Hudson.
New Jersey	Newark	July 5, 3 p.m.	Widening and improving the Newark Plank Road.	A. H. Wearn, City Clerk.
North Carolina	Charlotte	July 5, 8:30 p.m.	Paving 58,400 sq. yds. with bitulithic, sheet asphalt, bituminous macadam, vit. brick and wood block.	J. G. McMillan, County Surveyor.
California	San Jose	July 5	Improving Cochran Road and Gilroy Hot Springs Road.	C. A. Blackly, County Auditor.
Indiana	Valparaiso	July 5, 10 a.m.	Constructing 4 gravel roads.	Horace Blakely, County Auditor.
Indiana	Bloomington	July 5, 2 p.m.	Constructing a highway in Salt Creek township.	J. M. Stone, County Auditor.
Indiana	Rushville	July 5, 2 p.m.	Constructing a macadam road in Jackson township.	
Indiana	Wabash	July 5, 1:30 p.m.	Constr. 3 roads in Paw Paw twp., 2 in Noble, 2 in Chester; 2 in Town of North Manchester.	J. P. Nofziger, County Auditor.
Indiana	Logansport	July 5, 10 a.m.	Constr. a stone road in Boone twp.; gravel roads in Eel and Jefferson townships.	J. E. Wallace, County Auditor.
Indiana	Brownstown	July 5, 1:30 p.m.	Constr. the Medora and River Bridge road and the Sparkville Hill Road.	H. W. Washer, County Auditor.
Indiana	Sullivan	July 5, noon	Constr. gravel, bituminous macadam and stone roads.	Ben. C. Crowder, County Auditor.
Indiana	Muncie	July 5, 10 a.m.	Constr. roads in Union, Center and Mt. Pleasant twps.	Francis M. Williams, County Aud.
Indiana	Kokomo	July 5, 2 p.m.	Constructing 9 mile road in Clay township.	A. B. Easterling, County Auditor.
Pennsylvania	Shamokin	July 6	Paving 3 streets.	W. H. R. Smink, Chief Burgess.
Indiana	Logansport	July 6, 10 a.m.	Constructing a stone road bet. Deer Creek and Washington twps.	J. E. Wallace, County Auditor.
Indiana	Monticello	July 6, noon	Constructing a stone road in Honey Creek twp.	A. G. Fisher, County Auditor.
Indiana	Kentland	July 6, 1 p.m.	Constr. a macadam road in Iroquois twp. and system of stone roads in Grant, Iroquois and Jackson twps.	E. R. Bingham, County Auditor
Pennsylvania	Wilson	July 6, 8 p.m.	Grading, paving and curbing portion of Fourth street.	J. O. Spence, Chm. St. Com.
Indiana	Evansville	July 6, 10 a.m.	Constructing, grading, and rocking a highway in Center twp.	Chas. P. Beard, County Auditor.
Illinois	Denison	July 6, 2 p.m.	Constructing 2 macadam roads.	Geo. Gray, Chm. Comrs. Hwys.
West Virginia	Huntington	July 6, 1 p.m.	Paving various streets with vit. brick, asphalt, bitulithic, tarvia or asphalt block.	A. B. Maupin, City Engr.
Oregon	Grants Pass	July 6	Constructing 30,000 sq. yds. of pavement.	F. E. Holston, City Engineer.
Mississippi	Meridian	July 6, 2 p.m.	Constr. 12.35 mi. Novaculite roadway; 2 mi. sand-clay road.	W. P. Moore, Chief Engineer.
New York	Olean	July 6, 8 p.m.	Constr. about 5,000 sq. yds. wire-cut-lug block pavement on concrete foundation; 3,500 lin. ft. stone curb.	John H. Gaynor, Engineer.
Ohio	Cincinnati	July 7, noon	Oiling Harrison pike in Harrison and Whitewater townships; also repairing Indian Hill avenue in Columbia township.	Stanley Struble, Pres. Bd. Co. Comrs.
Ohio	Mt. Gilead	July 7, 11 a.m.	Improving 7½ miles of country road.	Clifton Sipe, County Auditor.
North Carolina	Tarboro	July 7, 4 p.m.	Constr. about 25,000 sq. yds. of 8 in bituminous macadam paving; alternate bids on 8,000 sq. yds. vit. brick and 11,000 sq. yds. bituminous macadam; constr. sidewalks, drain, etc.	W. O. Howard, Mayor
Indiana	Williamsport	July 10, 2 p.m.	Constructing a gravel road in Adams township.	D. H. Moffitt, County Auditor.
North Carolina	High Point	July 10, 1:30 p.m.	Grading, curbing and macadamizing various streets, estimated cost \$40,000.	Fred N. Tate, Mayor.
Indiana	Rockville	July 10	Constr. the Shonkwiller Road in Jackson and Union townships, Parke County and in Clinton and Madison townships, Putnam County.	County Commissioners.
Alabama	Andalusia	July 10, noon	Grading and surfacing with sand clay 9 miles of road.	D. K. Caldwell, County Engineer.
Ohio	Wadsworth	July 10, noon	Grading, curbing and paving with vit. brick about 9,500 sq. yds.	Louis F. Allen, Village Clerk.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS (Continued)				
Iowa	Greenfield	July 11, 2:30 p.m.	Constr. about 14,000 sq. yds. brick or cement paving; 4,500 lin. ft. curb; Iowa Engr. Company, Chase Block, Clinton, Iowa, Engineers.	Town Clerk.
Pennsylvania	Washington	July 12, 11 a.m.	Constr. various county roads with necessary culverts and small bridges, about 23 miles in all.	John H. Moffitt, County Compt. John H. Moffitt, County Compt.
Pennsylvania	Washington	July 12, noon	Furn. vit. brick to be used in constructing 162,000 sq. yds. pav.	Bd. Co. Comrs.
Ohio	Columbus	July 12	Resurfacing about 24,000 ft. of county road in Marion twp.	F. F. Pillett, City Engineer.
North Carolina	Wilmington	July 15, noon	Constr. 24,000 sq. yds. paving, curbing and guttering.	Norman Buckner, Twp. Clerk.

STREET IMPROVEMENTS

Montgomery, Ala.—City Commissioners have instructed City Engineer Gilchrist to prepare estimates of cost of preparing Houston, Bell and South McDonough Sts. for oiling and estimates for final cost of oiling these streets.

Tucson, Ariz.—Board of Trustees of Pima County will soon ask bids for construction of speedway; work will consist of grading and oiling; road will be 23 miles long and 30 ft. wide.

Los Angeles, Cal.—Plans for boulevard to extend along northeastern side of Elysian Park have been submitted by the City Engineer to the Board of Public Works; two separate plans for the road are suggested, one of which is estimated to cost \$33,399 and the other \$44,619.

Monrovia, Cal.—Board of Trustees has passed several ordinances providing for extensive street improvements; Falling Leaf Ave. will be graded, oiled and curbed its entire length, a distance of fully a mile, and Orange Ave. will be improved in part.

South Pasadena, Cal.—Plans are being prepared for improvement of five streets with oil macadam at cost of \$300,000.

Colorado Springs, Col.—City Engineer T. L. Wagener has completed estimates of the cost of paving business section as follows: For asphaltic concrete, \$238,370; bitulithic paving, \$265,218; sarcalthic paving, \$229,420; sheet asphalt, \$239,477.

East Hartford, Conn.—Fire District Commissioners have decided to macadamize two streets.

Palatka, Fla.—Citizens will vote July 11 on \$15,000 bonds for paving.—H. A. Davis, Mayor.

St. Petersburg, Fla.—Citizens have voted \$35,000 brick paving bonds and \$5,000 for construction of steel crossing bonds.

Tampa, Fla.—Council is considering paving of West Tenth Ave., West Tampa.

Oglethorpe, Ga.—Macon County will vote on \$150,000 bonds for road construction.

Waycross, Ga.—Ordinance calling for expenditure of \$50,000 for paving sidewalks has been passed by Council. Alderman James Sinclair, Chairman of Finance Committee, will advertise for bids.

East Moline, Ill.—Board of Local Improvements has decided to pave State St. with brick at cost of \$53,000.

East St. Louis, Ill.—Board of Local Improvements has decided to pave Forty-second St. from Lincoln Ave. to Caseyville Rd. with brick.

Indianapolis, Ind.—Board of Public Works has adopted resolutions for ten street improvements to cost about \$60,000.

Mishawaka, Ind.—Board of Public Works has ordered paving of Bridge St.; material undecided.

Bangor, Me.—City is considering a proposition for widening Central St. and con-

structing retaining wall at the edge of the street along whole length of the thoroughfare from the foot of Hammond St. hill to Harlow St.; cost, \$300,000.—P. H. Coombs, City Engineer.

Grand Rapids, Mich.—Bids will be received July 3, 3 p. m., for \$108,000 street improvement bonds.—Jas. Schriener, City Clerk.

Monroe, Mich.—Council has decided to pave Washington St. at cost of \$18,000.

Butte, Mont.—Street and Alley Committee has recommended purchase of steam roller.

Belton, Mo.—Citizens have voted \$10,000 bonds to macadamize business streets.

St. Joseph, Mo.—Board of Public Works has decided to pave Quessame St. with sandstone blocks.—Alfred Meier, President.

Carson City, Nev.—Commissioners of Ormsby County have completed arrangements for building of new road in this county to connect with boulevard to be built in Washoe County from Reno to line of Ormsby County; work will be done by convicts and county will pay so much per man for convicts working on road.

Albany, N. Y.—Board of Contract and Supply will at once ask bids for improving Providence St. and paving Quail St.

Larchmont, N. Y.—Citizens have voted \$25,000 appropriation for sidewalks.

Lestershire, N. Y.—Citizens have voted \$21,000 bonds to improve Main St.

Wrightstown, N. Y.—New Hanover township has decided to issue bonds to build gravel road from Wrightstown through Pointville to township line on the road to Brown's Mills.

Burgaw, N. C.—Pender County will vote July 25 on road improvements.

Mt. Hope, Kan.—Election on bonds of water works is being considered.

Kentwood, La.—Citizens will vote on bond issue of \$50,000 for water and sewerage system.

Libertytown, Md.—Town is to have a water works of its own if the plans of the Volunteer Pipe Company materialize; orders have been given to Civil Engineer E. C. Crum to begin surveys latter part of next week, and the work will be pushed as fast as possible; a stream, called Town Branch, which runs through town, will be utilized for supply.

Rising Sun, Md.—Establishment of water works system is being considered.

Franklin, Mass.—Town has sold \$40,000 water bonds to E. H. Rollins & Sons.

Benton Harbor, Mich.—Citizens have voted \$50,000 bonds for water works.

Grand Rapids, Mich.—Bids will be received July 3, 3 p. m., for \$200,000 sand filtration bonds.—Jas. Schriver, City Clerk.

Eveleth, Minn.—Cost of installing water main on Elba Ave. has been estimated at \$1,397.15 and on Harrison St., \$319.60.

Grasson, Minn.—John Youngquist will prepare estimate on cost of installing water mains.

Culbertson, Mont.—Citizens have voted \$39,500 bonds for water works system.

Cabool, Mo.—Citizens will soon vote on \$9,000 bonds to install water system.

Milan, Mo.—Preliminary plans have been prepared by Hiram Phillips, Consulting Engineer, Third National Bank Bldg., St. Louis, for installation of a water works system; estimated cost is \$25,000; work includes construction of a reservoir.—John W. Boughen, Milan, is in charge.

Bellevue, Neb.—Citizens will soon vote on bonds for erection of municipal water works and sewer system.

Louisville, Neb.—Citizens have voted \$6,000 bonds for installation of water works.

Omaha, Neb.—Citizens will vote June 28 on \$8,250,000 water bonds.

Charlestown, N. H.—Town is arranging to construct small gravity water system for village of North Charlestown; pipe, hydrants, etc., have been purchased and will be laid by the superintendent of the Charlestown Water Works.—Dudley & Sawyer, Manchester, Engineers.

Trenton, N. J.—George Johnson, of the firm of Johnson & Fuller, Consulting Engineers, who have in charge preparation of a hypochlorite sterilization plant for water department, has submitted plans to the Water Board.

Albany, N. Y.—State Water Supply Commission has denied application of the Monroe County Board of Supervisors for regulation of Genesee River, under River Improvement Act, by construction of reservoir at Portage at cost of about \$5,000,000.

Selma, N. C.—City desires water works, with tanks of 50,000 to 100,000 gallons capacity; water supply from deep wells or Neuse River.—John A. Mitchener, Mayor.

Oak Harbor, O.—Citizens have voted \$35,000 bonds for water works improvements.

Bennington, Okla.—City will construct water works at cost of \$20,000.

McAlester, Okla.—City has advertised for bids for one duplex pump and 40,250 lin. ft. eight-in. black steel pipe, to be used in extension of city water works system.

Hermiston, Ore.—Walter B. Hinkle has been selected to prepare plans and superintend construction of proposed water system.

Monmouth, Ore.—Citizens have voted \$25,000 bonds for water works.

Glen Rock, Pa.—Jacob H. Brillhart, 31 N. Seventh Ave., Bethlehem, is preparing plans and specifications for additional water supply.

Ipswich, S. D.—Bids will be received about July 15 for the construction of water works from plans of the Dakota Eng. Co., Mitchell; cost about \$20,000.—E. J. Engler, City Auditor.

Galveston, Tex.—City Engineer A. T. Dickey, after inspection of city water works pumping station, has recommended increasing of compressed air pipe in each of the 30 wells a distance of 15 ft.

New Braunfels, Tex.—Citizens will vote July 11 on \$67,000 bonds to construct dam across the Guadalupe River and lay mains from dam to the Comal Springs, where pumping station will be installed to furnish city's water.

Rocky Mount, Va.—Citizens have voted \$75,000 bonds for establishment of water works, sewerage and municipal electric light plant.

Tacoma, Wash.—Installation of hydrants in various sections of the north end is being urged.

Wapato, Wash.—Engineer D. R. Redman has submitted to Council plans and specifications for a municipal water plant for city.

Melfort, Sask., Can.—T. Aird Murray, Consulting Engineer, Toronto, has presented report to the town regarding proposed installation of water works and electric light plant.

St. Boniface, Man., Can.—City will expend \$75,000 on the water works system this year; \$40,000 of which will be used for erection of reservoir.

CONTRACTS AWARDED

Gadsden, Ala.—Furnishing pipe and specials for extending water mains to American Pipe & Foundry Company; valves, lead and yarn to Crane Company, and hydrants to Ludlow Manufacturing Company.

San Francisco, Cal.—Completing the laying of pipe for an auxiliary water system to the Raichs Improvement Co., 199 Montgomery St., \$91,500.

Vallejo, Cal.—Construction of reservoir on Fleming Hill about 20 miles north of this city to the American Construction Co., San Francisco, \$35,925.

Greeley, Col.—To Foster & Doll, Denver, for doing concrete and iron work for filtration basin No. 3 at the city water works, \$7,565.

Evansville, Ind.—Contract for dirt fill to be made around filter plant at the city water works to Parsons & Rooney, contractors, 24½c. per cu. yd., to be made with wheel scrapers.

Frederick, Md.—Improvements to water works; furnishing and laying to 1013 tons c. i. pipe, to United States Cast Iron Pipe & Foundry Co., 71 Broadway, New York City, \$21,531; pipe, to R. D. Wood & Co., New York City, \$1,075; valves, hydrants, etc., to Charles Roy, Johnstown, Pa., \$79,641; for excavation and laying of pipe, to William H. Boardman, 426 Walnut St., Philadelphia, Pa.—Frank E. Tyerar, Superintendent.

Boston, Mass.—Relaying water pipe in five streets, Charlestown, to S. Canal, \$1,119.00; engineer's estimate, \$1,355; same in Intervale St., Dorchester, \$1,500; Road, Maple and Maxfield Sts., West Roxbury; Park Vale Ave., Miles and Tip Top Sts., Brighton; Cottage, Lubee and Orleans Sts., East Boston, to High McNulty, \$1,100.00; other bidders: John A. Costello & Co., \$1,321; Michael De Sisto, \$1,355.30; Thomas Burke, \$1,128.10; Daniel E. Lynch, \$1,790; engineer's estimate, \$1,432; same in Church, Fayette and Melrose Sts., city proper, to J. A. Costello & Co., \$1,155.05; engineer's estimate, \$1,937.50.

Two Harbors, Minn.—Furnishing 30-kw high efficiency transformer for water and light plant to Jos Beck.

New York, N. Y.—To the T. A. Gillespie Co., 50 Church St., for completion of Hudson system and part of the Hudson River division of the Catskill aqueduct in the towns of Cornwall and Fishkill, \$1,619,020.

Concord, N. C.—To Clarendon Construction Co., Wilmington, N. C., to install complete filter plant, \$26,000; to Glamorgan Pipe & Foundry Co., Lynchburg, Va., for c. 1. pipe, \$13,500.

Bradley, S. D.—Building water works to Joel McKee, city, \$12,722; other bidders: E. L. Dumchel, Laurel, Neb., \$14,589; Roberts & Fum, Brookings, \$14,405; Fraser & Danforth, Rochester, \$13,216; Des Moines Bridge & Iron Works, Des Moines, Ia., \$14,096; Cook Construction Co., Des Moines, \$14,459; L. W. Schruth, Fargo, N. D., \$13,864; and W. D. Lovell, Minneapolis, Minn., \$13,631.

Denison, Tex.—By City Commission to D. W. Rainey, Muskogee, to drill artesian well at new waterworks pumping station.

Ft. Ward, Wash.—To McInnis & Harington for constructing reinforced concrete reservoir Worden \$31,200; pipe line, \$5,100.

Redmond, Wash.—To Jeffery & Buffon, Portland, Ore., for proposed water works system at Clino Falls, \$24,500.

Snohomish, Wash.—To Atlas Construction Co., Everett, to lay 16 in. of wooden water mains.

BIDS RECEIVED

Geneva, N. Y.—Constructing reservoir in connection with water system improvement as follows: Lupfer & Remick, of Buffalo (2 bids), \$26,850 and \$22,900; Coughlin, Lowman & Bradley, Elmira, \$24,632; Simpson Bros. Cor., Boston, Mass., \$28,960; G. W. Thompson, Utica, \$30,250; Hennebique Construction Co., New York City, \$34,900; Gahren, Dodge & Maltby, New York City, \$38,865.

Fort Worth, Tex.—Building filtration plant: Texas Building Co., of Fort Worth, the New York Continental Jewel Filtration Co., and the Pittsburg Filter Mfg. Co., the last-named submitting two bids of \$62,207 and \$69,983, in accordance with different plans; highest bid, \$76,156.

Lexington, Va.—Furnishing material and work on gravity water supply: A. Wyckoff & Son, Elmira, N. Y., 41,600 ft. of wood pipe, \$18,503; U. S. Cast Iron Pipe and Foundry Co., Philadelphia, Pa., 16,800 ft. of 8-in. c.-1. pipe, at \$22.90 per ton, or \$8,931; Glamorgan Pipe and Foundry Co., Lynchburg, Va., 16,800 ft. of 8-in. c.-1. pipe, at \$23.50 per ton, or \$9,165; Lynchburg Foundry Co., Lynchburg, 16,800 ft. of c.-1. pipe, at \$23.65 per ton, or \$9,223; R. D. Wood, Philadelphia, Pa., 16,800 ft. of 8-in. c.-1. pipe, at \$24 per ton, or \$9,360; Central Foundry Co., 16,800 ft. of 8-in. Universal joint pipe, \$11,592. Trenching and pipe laying: H. C. Brooks, Clarksburg, W. Va., \$28,943; S. B. Benington, Lynchburg, \$32,021; J. L. Meem, Lynchburg, \$28,386; Stamper Tagland & Co., Richmond, Va., \$25,090; Gallagher & Bryan, Baltimore, Md., \$22,537; Cantrell Construction Co., Parkersburg, W. Va., \$23,655; J. F. McGuire, Norfolk, Va., \$24,219; C. O. Ladd & Co., Germantown, O., \$19,960.

LIGHTING AND POWER

Berryville, Ark.—North Arkansas Power Company has been incorporated, capital \$100,000, to develop electricity from streams in Northern Arkansas for use for lights and power for factories, etc. J. R. Neff, E. Ingram, Ellis D. Munger and others, Directors.

Clarksville, Ark.—City will construct electric light plant; cost, \$20,000; will purchase wires and poles of E. T. McConnell's plant, destroyed by fire. John M. Davis, D. Ward Dunlap and A. N. Ragon, Board of Commissioners.

Cotter, Ark.—City has granted 30-year franchise to E. B. Griswold to operate electric light plant.

Dermott, Ark.—City is considering improving electric light plant; betterments will include installation of direct-connected generating unit.

Live Oak, Cal.—Metz & Berg have been granted permission to build electric light system.

Wilmington, Del.—Street and Sewer Commissioners have decided to remove all wires, poles and posts from Market st., which is to be beautified by the use of ornamental standards for lights and trolley wires.

Plant City, Fla.—City is considering construction of electric light plant.

Washington, Ga.—Citizens will vote July 14 on \$30,000 bonds for reconstructing electric light plant; will erect building 60x70 ft. mill construction; Westinghouse, Church, Kerr & Co., 10 Bridge st., New York, engineers.—E. A. Barnett, Mayor.

Elkhart, Ind.—Indiana & Muncie Electric Co. is preparing to ask for bids for rebuilding of dam in St. Joseph River and erection of power house.

Elkton, Md.—Council has granted franchise to Home Manufacturing Light & Power Company.

Easthampton, Mass.—Easthampton Gas Co. has applied for permission to issue \$125,000 additional stock; part will be expended for improvements.

Mansfield, Mass.—Town has voted to issue \$22,500 bonds for enlargement of municipal light plant.

Canby, Minn.—Installation of electric lights is being considered.

Coffeeville, Miss.—P. M. Woodall desires correspondence with manufacturers of machinery for electric light plant for town of 700 or 800 people; gas-producer type to burn lignite preferred.

Deeth, Nev.—Board of Commissioners has granted franchise to Deeth Mercantile Co. to build and operate electric lighting system.

Whippany, N. J.—No 50-year franchise to lay gas mains along Hanover Township Road will be given to the Public Service Gas Company, of Morristown.

Chaumont, N. Y.—Charter has been granted to the Chaumont Electric Light Co. with a capital stock of \$8,000. Edgar H. Merriman, of Adams Center, and Chas. N. Arnold and George Diefendorf, Chaumont, Directors.

Rochester, N. Y.—To Standard Underground Cable Company for 6,000 ft. of four-conductor cable for the Fire Alarm Telegraph System, 9 1-10 cts. per ft.

Selma, N. C.—City desires electric light plant.—John A. Mitchener, Mayor.

Valley City, N. D.—O. N. Guldin, Ft. Wayne, Ind., has petitioned for franchise to install gas plant.

Williston, N. D.—Lignite coal deposits of this region will be utilized in manufacture of gas through action of Col. A. B. Kerlin, of Devils Lake, and E. A. Wilson, of Fargo, who will act jointly in establishment of gas plant at early date.

Beaumont, O.—The Central Ohio Power Co. will soon be formed to construct electric power plant; C. W. Humphrey, Chicago, Ill., Architect.

Shawnee, Okla.—City is without light or power because of the burning of big power house of Shawnee Gas and Electric Company with loss of \$125,000.

Greenwood, S. C.—City desires gas plant; 8,000 population; would consider granting franchise. G. W. Gardner, care of Greenwood Journal, can be addressed.

Chamberlain, S. D.—Contracts will soon be let for the construction of proposed electric light plant for the Electric Light Co.—J. H. Kennedy, Secretary.

Corpus Christi, Tex.—Ordinance granting gas franchise to a syndicate composed of Joseph Hirsch, Royall Givens, M. T. Gaffney, Jacob Smith and others has been passed by Council.

Newport News, Va.—Citizens have defeated proposition to issue \$150,000 bonds for erection of municipal electric light plant.

Richmond, Va.—Committee on Electricity has authorized purchase of 16,000 ft. of wire for the municipal plant and four transformers to be used in Washington Ward; estimates have been asked for ornamental lights on Jefferson St., from Broad to Franklin.

Bluefield, W. Va.—Appalachian Power Co. has bought electric plant at Keystone and Welch.

Bluefield, W. Va.—T. George Carroll, Baltimore, Architect, has been selected to prepare plans for large retort house and apparatus rooms for Bluefield Gas & Power Co.; proposed building will be two stories high, of brick, with stone and concrete trimmings.

Menasha, Wis.—Council has voted to contract with Northern Hydro-Electric Co., Oshkosh, for current to supply municipal commercial lighting system; proposed to issue bonds to cover the cost of transmission lines and service connections.

Wausaukee, Wis.—Alex. Dufresne is planning to install electric light plant.

CONTRACTS AWARDED

Chicago, Ill.—Furnishing 25,000 ft. No. 6 B. & S. J. rubber-covered lead-encased electric light cable to the Simplex Electrical Co., 1144 Monadnock Block, Chicago, \$3,287.—Wm. Carroll, City Electrician.

Pittsfield, Mass.—Building 28 miles of high-tension transmission line from Pittsfield to Canaan, Conn., to F. T. Ley Co., Inc., Springfield, for the Berkshire St. Ry. Co.; 8 miles of this line will be on steel towers; contract also includes an addition to power house at Pittsfield and number of transformer stations along the line.

York, Pa.—Edison Electric Light Company to the Smysler-Royer Company to supply ornamental iron posts for use in Center Square; lights will be placed in position during the summer.

Richmond, Va.—Underground wiring on West Broad St. to W. H. Jenks, city, \$985.

Melville, Sask., Can.—Light and water improvement to Kilmor, Pullen & Burnham, Toronto, Ont., agents for General Electric Co., for generators, switchboards, exciters, pumps, motors and compressors, installed complete, \$7,438; the Northern Electrical & Mfg. Co., Ltd., Winnipeg, Man., for street lighting system, \$832, and for poles and all line material, \$2,947, and William Bross & Sons, Minneapolis, compression tanks, \$2,018; McAvity & Cons, St. Johns, N. B., for hydrants, and Stanley-Brook Co., Toronto, Ont., for mains and castings.

FIRE EQUIPMENT

San Jose, Cal.—Citizens have voted \$60,000 bonds to purchase new equipment for fire department.

Thompsonville, Conn.—Fire Chief W. J. Hines has recommended purchase of auto fire truck and installation of additional fire alarm boxes.

Indianapolis, Ind.—Board of Public Works is considering erection of three engine houses; \$95,000 available.—C. A. Schrader, President.

Atlantic City, N. J.—Councils' Fire Committee is now actively at work on plans for the new fire station to be erected at Atlantic and California Ave.

Burlington, N. J.—Neptune Hose Company will erect fire house.

Marion, O.—Council has adopted \$22,500 bond ordinance for erection of fire station and \$15,000 for auto fire apparatus.

Norwood, O.—Council has passed ordinance authorizing \$2,500 bond issue for equipment of fire department.

Roff, Okla.—City is considering erection of \$10,000 fire station and city hall.

Milton, Ore.—Council has appointed committee to ascertain probable cost of hook and ladder and hose cart.

St. Johns, Ore.—Fire Commissioners will at once purchase three hose carts and 1000 ft. of hose.

East Mauch Chunk, Pa.—Fairview Hose Company is considering purchase of steamer.

Washington, Pa.—Special Committee has recommended purchase of combination auto chemical engine and hose wagon.

Salina, Utah.—Council has decided to purchase 1600 ft. of hose.

Wheeling, W. Va.—Fire Committee has recommended erection of chemical house, purchase of chemical hose at cost of \$500 and cotton hose at \$2,000; also minor equipment.

CONTRACTS AWARDED

Sacramento, Cal.—Furnishing aerial truck for Fire Department to C. Gray Company, \$6,000; two runabouts for Chief and Assistant Chief to Thos. B. Jeffrey Company.

Bayonne, N. J.—Furnishing 2000 ft. of fire hose; 700 ft., each at 90c. per ft., to the Fabric Fire Hose Co. and the Voorhees Rubber Co., 600 ft., at 90c. per ft., to Eureka Fire Hose Co.

Little Falls, N. Y.—To G. F. Andrews for building hose wagon, \$245.

Lebanon, Pa.—To the C. C. C. Fire Hose & Rubber Co., for 1050 ft. Gold Standard special brand multiple woven hose, \$1.10 per ft.; to Eureka Fire Hose Manufacturing Co., for 1050 ft. Paragon 3-ply hose, \$1.10 per ft.

Simple and Inexpensive Culvert Construction

Our Collapsible Steel Forms have revolutionized the building of road culverts. No road-building equipment complete without them. Illustration shows culvert with End Plates removed, steel form in place ready to be collapsed.

Sizes range from 12 in. up to 72 in. Tops are interchangeable. Forms erected and collapsed in sections. Can be handled anywhere.

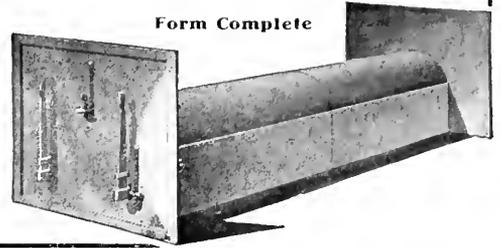

Will last a lifetime. No complicated mechanism or parts that rust out or need adjustment. Always dependable. Endorsed by engineers, contractors and highway officials everywhere.

STREET IMPROVEMENTS

Colton, Cal. City is considering \$250,000 expenditure for street improvements, including purchase of road outfit.

New Castle, Del.—William A. Kimmey, City Engineer, is now engaged in making inspections of different road materials preparatory to asking for bids for paving of streets.

Washington, D. C.—District Commissioners have ordered improvement of L St. S. E. at cost of \$3,000.

Newark, N. J.—Board of Works has decided to ask for new bids for paving Woodside Ave.

Syracuse, N. Y.—Surveys have been completed for proposed improved county highway in southeastern part of the town of Skaneateles; surveys have been finished also for Manlius-Oran road, and for about four miles on each Jamesville-Onatavia highway and road from the Collamer improved highway towards South Bay.

South Fork, Pa.—Portions of five streets in borough are to be paved this year.—W. O. Thomas, of Johnstown, Borough Engineer.

Lynnville, Tenn.—Board of Aldermen is considering building of new streets; also repair of present streets.

Spokane, Wash.—Paving plan for the Northwest boulevard has been recommended to the City Council by Commissioner Coates. Estimates of various kinds of paving for the job compiled by the City Engineer are: Asphalt, \$156,000; asphalt macadam, \$113,000; bitulithic, \$172,000; bitumass, \$129,000; granitoid concrete, \$178,000; standard concrete, \$178,600; Hasam concrete, \$151,300; petrolithic, \$104,000; and wood block, \$187,000.

Superior, Wis.—Council has ordered repaving with permanent material of North Fourteenth St.

CONTRACTS AWARDED

Pasadena, Cal.—Grading, oiling, curbing and guttering of Catalina st., from Washington to north city limits, to W. A. Donatville, \$6,407.72.

Tampa, Fla.—To Edwards Construction Company for building 1 mile of shell paving in Seminole Heights for Seminole Developing Company.

Belvidere, Ill.—Macadam paving, grading and curbing of North Main, Van Buren, Menominee and Perry sts. for the distance about the city park, and for Huribut ave., to Fair & Taylor, Belvidere, \$22,495.

Holyoke, Mass.—Paving 6,100 sq. yds. with brick, to Shawmut Paving Brick Co., \$1,865 per sq. yd.; granite blocks, to Daniel O'Connell's Sons, \$54 per 1,000.

Newark, N. J.—To P. & P. Janaronne for paving South St. with granite; to MacMahon Construction Company for paving Clifton St.

Paterson, N. J.—By Freeholders for oiling about fifty miles of country roads, the total cost of which will be about \$11,000, to J. S. Sowerbutt and McKiernan & Bergen, lowest bidders.

Rochester, N. Y.—Broquois St. brick pavement to Thomas Hoahan, \$2,740; Court St. sewer to Henry Schoenfeldt, \$1,300; Blossom Road grading and walks to W. A. Margrander, \$8,721.50.

Cincinnati, O.—Building culvert on Betts Ave., College Hill, by County Commissioners to Wm. J. Flynn, \$1,255.

Norwood, O.—Oiling streets, to Citizens' Road Preserving Co., of Cincinnati, .2865 per sq. yd.

Grand Rapids, Mich.—To L. C. Hilding for paving Fountain St., \$6,977.40; other bidders: McDermott & Cooper, \$7,337.43, open; C. E. Williams, \$7,657.03, open; Carpenter & Anderson, \$7,254.85, standard; the engineer's estimate was \$7,017.20, open, and \$7,907 in the closed specifications; street will be paved either with asphalt or bituminous macadam.

Pittsburg, Pa.—Furnishing county with road roller to Kelly Springfield Road Roller Company.

Chattanooga, Tenn.—Paving Main st. with a 11-ft. vitrified brick center, flanked on each side by 11-ft. strip of California asphalt, to Southern Paving & Construction

Co., \$67,098.73; asphalt used will be the Maltha brand.

Dallas, Tex.—Paving North Akard st., to Crosfoot Wood Block Paving Co., \$3.29 per sq. yd. for 4-in. crossfooted wood block.

Lockhart, Tex.—To Van Flowers, to lay six miles of macadamized roads between Luling and Prairie Lea.

Chehalis, Wash.—By City Council for planking number of streets in the eastern part of the city, to Albers & Son, about \$6,950.

Tacoma, Wash.—Various Improvements. To Ollar Robinson & Co. for paving East 26th st. in local improvement district No. 453 with brick, \$25,800; Lister Construction Company, for grading and planking Portland ave. and constructing sidewalks along the thoroughfare, \$23,800; Engineer's estimate was \$27,294; to Tignalli & Paine, for grading North 25th st. from Proctor to Stevens in local improvement district No. 767, \$5,540; Engineer's estimate was \$7,011; nine other bids were received, the highest being \$6,946; construction of sanitary sewer in local improvement district No. 1100, to Salatino & Chiappetta, \$2,375; to the Kasal Construction Company, for laying water mains in local improvement district No. 578, which includes the Hunts Prairie, Latschaw, Mechanics, Travers Oak Grove and Hays' additions, \$3,306; the local improvement district No. 572 for laying mains through Opie's Tacoma ave., Gray's Tacoma ave., the Belmore, Cottage Home and Pewey's First additions, to Tignalli & Paine, \$4,950; estimate, \$5,484; contract includes laying a 12-in. wood main along Park ave. from 72d to 76th sts. and 6-in. c.-i. and wood mains along 73d, 74th and 75th sts.

SEWERAGE

Mishawaka, Ind.—Board of Public Works has passed resolution for construction of sewer on North Race St.

Holyoke, Mass.—Board of Public Works has decided to ask prices for 2,400 ft. of sewer pipe; the City Engineer will submit plans for extension of Franklin st. sewer.

Libby, Mont.—Citizens have voted \$20,000 bonds to install sewers and take up outstanding warrants.

Binghamton, N. Y.—City Engineer John A. Giles finished survey for Pennsylvania and Park Ave. sewers.

Chattanooga, Tenn.—Town Commissioners of St. Elmo have contracted with engineering firm of Cushman & Fairleigh to make plans and supervise construction of sewerage system.

WATER SUPPLY

Prairieburg, Ia.—Citizens will soon vote on installation of water works system at cost of \$4,000.

South Stillwater, Minn.—Bids will be received July 5, 8 p. m., for \$5,000 bonds to improve water works.—C. A. Anderson, Recorder.

Blairsville, Pa.—Council is now investigating gravity system of water supply.

Dallas, Tex.—Purchase of three large air compressors, two pumping engines, the necessary 8 to 16-in. water pipe and other fixtures for immediate use in Water Department has been authorized by Board of City Commissioners.

CONTRACTS AWARDED

Cincinnati, O.—Furnishing two electric current generators for filtration plant of the waterworks, by Director Sundmaker to the Fort Wayne Electric Works, \$1,635.

Muskogee, Okla.—To United States Cast Iron Pipe & Foundry Co. for pipe for new water works system, \$83,000; to Wrenslor Co. to supply the valves and hydrants, and to John B. Clow fittings.

FIRE EQUIPMENT

Bay City, Mich.—Fire Committee will soon ask bids for purchase of proposed auto fire apparatus.

Matteawan, N. Y.—Architect C. B. Van Slyck has prepared plans for erection of

truck house on Main st. for W. H. Mase Ladder & Truck Company.

Barberton, O.—Council has decided to purchase fire engine.

Alpine, Tex.—Volunteer fire company is being organized.

Spokane, Wash.—Citizens will vote July 18 on \$100,000 bonds to erect fire station.

CONTRACT AWARDED

Beaumont, Tex.—Furnishing automobile combination chemical and hose wagon at a cost of \$5,500, to American La France Fire Engine Co., Elmira, N. Y.

BRIDGES

Hoquiam, Wash.—Council has instructed its Clerk to call for bids for construction of a wooden bridge across Hoquiam River at Ramer ave.; cost \$15,000.

CONTRACT AWARDED

Pittsburg, Pa.—Bridge work to the Universal Portland Cement Company for 5,000 barrels of cement; repairing county bridges according to specifications of the County Engineer to S. B. Little, Paumeister & Smith and Eli Crum; repairing joint bridges between Westmoreland and Allegheny Counties to J. C. Marshall, Eli Crum and S. B. Little; to Farris Bridge Company for cross-tied wood block for 18 county bridges, \$16,794; furnishing lumber to L. S. Hodli, W. T. McNeal and A. M. Bell.

MISCELLANEOUS

Springfield, Ill.—Plans by Architect Conway have been accepted for erection of bathing houses at two parks; cost, \$500 and \$700 each.

South Bend, Ind.—Board of Public Works has asked for bids for erection of boat house in Leeper Park to shelter police motor boat.

Fort Dodge, Ia.—City Health Officer Dr. C. J. Mulrone has recommended need of garbage incineration plant.

Louisville, Ky.—Plans by Architects D. X. Murphy & Bro. have been approved by Board of Aldermen.

Newark, N. J.—Board of Works has directed Chief Engineer Sherrerd to prepare data on installation of municipal garbage disposal plant.

Cincinnati, O.—Bids will be received July 11, noon, for \$300,000 bonds to erect and equip hospitals and pest houses.—E. Von Bargen, City Auditor.

Toledo, O.—Appropriation of \$2,000 has been voted by Finance Committee to Service Department to be used to begin work on comfort station at the Steadman monument, Summit and St. Clair Sts.

Philadelphia, Pa.—City will erect police station at 1251 N. Twenty-sixth St.

Sharon Hill, Pa.—Citizens have passed \$7,000 loan bill to make improvements.

El Paso, Tex.—County has voted to issue \$30,000 bonds to purchase poor farm.

Spokane, Wash.—Citizens will vote July 18 on \$650,000 bonds to erect City Hall.

CONTRACTS AWARDED

Holyoke, Mass.—Erecting shelter at Maple st. playground, to O'Connell's Sons, \$2,395.

Andrews, Tex.—Erecting court house, to F. M. Knight & Son.

Spokane, Wash.—Furnishing 100 refuse cans for street intersections, to Spokane Corrugated Culvert and Tank Company, \$640.

BIDS RECEIVED

Indianapolis, Ind.—Collecting and disposing of garbage: Indianapolis Sanitary Company, present contractor, \$63,000 year for five-year contract and \$62,000 for ten-year contract; Gemmer & Henry, \$68,000 year for five-year contract and \$63,000 year for ten-year contract; bids of the Indianapolis Sanitary Company are same as the bids the company submitted a month ago, while bids of Gemmer & Henry are \$1,000 a year less than their former bids.

Rotary Valve Seats

will increase life of rubber valves
300 per cent.

Two rubber valves pumping raw water under 167 lbs. pressure

There is shown here a photographic reproduction of a rubber valve used for 41 days on a common straight port seat. It will be noticed how deeply the rubber has been cut to the shape of the openings in the seat while in service.

This print was made from a rubber valve of the same brand and manufacture as that shown on opposite cut. It was taken from same pump fitted with our Rotary Valve Seats, after service of 136 days. It proves clearly that wear was uniform throughout. It was in good condition and fit for much longer service.

Increase your pumpage, save fuel and valve replacements by adopting them.

Correspondence solicited.

PROPOSALS

SEWAGE CLARIFICATION TANK AND SLUDGE DRYING BED

Winchester, Ky.

Sealed proposals addressed to S. B. Tracy, City Clerk of the City of Winchester, Ky., and endorsed on the envelope: "Proposals for Sewage Clarification Tank and Sludge Drying Bed," will be received until 7:30 P. M., July 7, 1911.

For making all excavations, back filling and grading, furnishing all materials and constructing complete a sewage clarification tank and sludge drying bed in accordance with the plans and specifications prepared by Chas. E. Collins, Consulting Engineer, Philadelphia, Pa., and now on file in the office of S. H. Rutledge, City Engineer.

Proposals shall be made upon blank forms to be obtained from the City Engineer. No proposal will be considered unless made upon the blank forms above mentioned, and unless accompanied by a certified check for the sum of Five hundred dollars on a national bank and payable to J. H. Hughes, Mayor.

The proposals will be opened publicly by the City Council at a regular meeting held in the Council Chamber, at 7:30 P. M., Friday, July 7, 1911.

The City Council reserves the right to reject any or all bids.

J. H. HUGHES, Mayor. S. B. TRACY, City Clerk.

H. B. SCRIVENER, Chairman, DR. M. S. BROWNE, J. T. STOKELY, Sewer Committee.

POLICE SIGNALLING SYSTEM, FIRE ALARM SYSTEM AND UNDERGROUND CONSTRUCTION.

Passaic, N. J.

By direction of the City Council proposals will be received by the City of Passaic from contractors for furnishing and installing a Police Signalling System, a Fire Alarm System and Underground Construction for the City of Passaic, in accordance with the general conditions, specifications and drawings on file in the office of the City Clerk, from whom blank proposal forms may be obtained.

Proposals will be received for

- (1) Police Signalling System. (2) Fire Alarm System. (3) Underground Construction. (4) General Proposal including Police Signalling System, Fire Alarm System and Underground Construction.

All proposals must be accompanied by a surety bond or a certified check payable to the City of Passaic in a sum equal to at least 2 per cent. of the amount of the bid.

The successful bidder will be required to give a surety bond in a responsible surety company for the full amount of the contract for the faithful performance of the contract and for indemnity against suits or claims for infringement of patents and as security that he will guarantee all workmanship and materials for a period of five years.

Every bidder must furnish satisfactory evidence of his experience and equipment, together with list of similar systems installed.

All bidders must state number of working days required to complete work, and damages of ten dollars per day will be stipulated in the contract for every day's delay over the time agreed upon for the completion of the work.

Bidders will be required to submit samples of the following apparatus and set up same to simulate service conditions at

PROPOSALS

Fire Headquarters when directed by the Committee. Failure to comply with this requirement will disqualify bidder.

- One automatic time and date stamp. One take-up reel. One central station flash-light equipment. One police box. One flash-light. One flash-light controller. One fire alarm box.

All bids must be enclosed in a sealed envelope bearing the name and address of the bidder and endorsed on the outside, "Proposal for (followed by the title of that portion of the work or the entire work as given above)" and must be delivered to the City Clerk or his deputy on or before the 12th day of July, 1911. No bid will be received after 8.00 p. m.

The City of Passaic reserves the right to reject any or all bids.

M. B. MATTHEWS, Chairman Committee on Public Safety. THOMAS R. WATSON, City Clerk. (28-5)

BRIDGE

Fitchburg, Mass.

Sealed proposals, addressed to the Board of Street Commissioners of the City of Fitchburg, Mass., and endorsed "Proposals for the Construction of the Fifth Street Viaduct," will be received by the said Board of Street Commissioners at the office of the City Engineer, Clerk of the Board, Fitchburg, Mass., until 5 p. m., of Monday, the 17th day of July, 1911, and on that day, at 7.30 p. m., will be publicly opened and read. The entire work is to be let in one contract.

Each bidder must make a personal examination of the location of the site of the viaduct.

Each bid must be accompanied by a certified check for five thousand dollars (\$5,000), payable to the City of Fitchburg; said check to be returned to the bidder unless he fails to execute the contract, should it be awarded him.

A bond for twenty-five thousand dollars (\$25,000) will be required for the faithful performance of the contract, the surety to be a substantial surety company, satisfactory to the Board of Street Commissioners and authorized by law to do business in the State of Massachusetts.

Prices proposed must cover all the expenses incidental to the completion of the works in full conformity with the specifications and contract.

The engineer's estimates of the quantities of work to be done are as follows:

Table with 2 columns: Description of work and Quantity. Includes items like Earth excav., Rock excav., Cinder filling, Gravel fill, Steel bars for concrete reinforcement, Structural steel, Concrete 1:3:5 Class A, Concrete 1:3:5 Class B, Concrete 1:2 1/2:4 1/2 Class C, Concrete 1:2 1/2:4 1/2 Class D, Concrete 1:2 1/4:4 Class E, Concrete 1:2 1/4:4 Class F, Hand rails, Scrubbing concrete surfaces, Painting concrete surfaces, Storm water inlets and drain pipes, Electric conduits, Lamp posts, single lights, Lamp posts, cluster lights, Electric wiring.

These quantities are approximate only, and the City of Fitchburg expressly reserves the right of increasing or diminishing the same as may be deemed necessary by its engineer.

Plans may be seen and specifications and forms of proposals obtained at the office of Timothy J. Sheehan, City Engineer, Fitchburg, Mass., and at the office of James H.

PROPOSALS

Fuertes, Consulting Engineer, 140 Nassau Street, New York City, upon making a deposit of twenty-five dollars (\$25). This deposit will be given back to the bidder upon the return of the plans and specifications in good condition.

Duplicate bids must be filed at the office of the City Auditor, Frank D. Page.

The Board of Street Commissioners reserves the right to reject any or all bids should they deem it to be for the interest of the City of Fitchburg to do so.

T. J. SHEEHAN, Clerk. (28, 5, 15)

REINFORCED CONCRETE RESERVOIR

Americus, Ga.

Sealed proposals will be received by the Mayor and City Council of Americus, Georgia, until July 17, 1911, for the construction of a reinforced concrete reservoir, sixty feet in diameter by thirteen feet in depth. Plans and specifications on file at the office of the City Engineer. No bid will be considered unless accompanied with certified check for five per cent of the bid as evidence of good faith. The right is reserved to reject any or all bids.

T. N. HAWKES, Clerk and Treasurer. J. B. ANSLEY, City Engineer. (26-5-12)
